It has been the fortune of this regiment to serve for the most part in those campaigns of the British army of which the ordinary British historian says least. But the value of a soldier's service is not to be measured only by success. It must be remembered that Leven's received, and still enjoys, the exclusive privilege of beating up for recruits at all times except Sundays, within the city of Edinburgh, without asking permission of the Lord Provost, and this privilege was conferred in acknowledgment of "the extraordinary bravery and resolution" with which the regiment maintained its ground at Killiecrankie. In leading a charge of Highlanders upon them Claverhouse received his death-wound. The character of the British army, slow to accept improvement, and able to do tolerably well without it, was exactly typified by Leven's gallant corps, which encountered in Flanders a French regiment armed with bayonets fixed after the fashion which afterwards became universal. This regiment advanced with fixed bayonets, and Lieutenant-Colonel Maxwell, who commanded Leven's, ordered his men to screw bayonets into their muzzles, thinking the enemy meant to decide the affair point to point. But to his great surprise, when they came within proper distance, the French threw in a heavy fire, which for a moment staggered his men, who nevertheless recovered themselves, charged, and drove the enemy out of the line. This is an epitome of British military history. Our armies have fought always bravely, and for the most part successfully, under difficulties which their civil and military leaders either caused or failed to do their utmost to remove. In old days, whatever were the weapons, there were always men behind them. Our modern anxiety about weapons must not cause us to forget the need of men; and men, like weapons, must be paid for. But to return to Leven's, we find that they fully shared the hardships, but missed the glories, of the wars which enriched the Belgian soil with British blood. They did stout service under King William III., and afterwards under the Duke of Cumberland, but there is no record of their having partaken in the victories of Marlborough. Nevertheless it was as good a victory to have earned in defeat such praise as this of Marshal Saxe, who wrote to the French Minister of War:—

I question much whether there are many of our Generals who dare undertake to pass a plain with a body of infantry, before a numerous cavalry, and flatter himself that he could hold his ground for several hours with fifteen or twenty battalions in the middle of an army, as did the English at Fontenoy, without any charge being made to shake them, or make them throw away their fire.

This is what we have all seen, but self-love makes us unwilling to speak of it, because we are well aware it is beyond our imitation.

After Fontenoy the regiment was carried back to England to oppose the Pretender. It marched from London to the North of Scotland, and took part in the battle of Culloden. Lord Balmorino, who was taken prisoner in that battle, had been a captain in the regiment in 1715, and quitted it when the Pretender landed in that year. For his share in two rebellions he was beheaded on Tower Hill. The regiment bore at Fontenoy the name of Lord Sempill, and afterwards that of the Earl of Crawford. It took honourable part in the battle of Val or Lauffeldt, and carried with it in the retreat which closed a well-fought day two standards of French colours, which were preserved in the Chapel of Whitehall until they were removed after 1819 to make way for newer trophies gained by the Duke of Wellington's army in the Peninsula. The British infantry at Val did their part well as at Fontenoy, but something went wrong somewhere, and they were involved in the general failure of the composite army of British, Austrians, and Dutch. It needed the genius of Marlborough to gain victories with such armies. The Duke of Cumberland, who was but an ordinary soldier, could only contrive to be defeated honourably. He sent home truthful despatches which enabled the British nation to see that its troops had done their duty.

When the regiment next served as part of an allied army, it was under a more skilful commander than the Duke of Cumberland, nor had it to contend against such a formidable adversary as Marshal Saxe. The army of Prince Ferdinand of Brunswick was well commanded and generally successful, and some of the glory of the King of Prussia was reflected on his allies. The fighting at Minden fell almost entirely on the British infantry. It is mentioned that this was the first battle in which the British troops took aim by placing the butt of the firelock against the shoulder, and viewing the object along the barrel. They had been instructed in this mode of firing during

the preceding peace. "On former occasions the firelock was brought up breast high and discharged towards the enemy a good deal at random, because it was considered a degradation to take aim." We shall probably be right in assuming that the British was the last army that adopted this mean practice of taking aim. The principal scene of these campaigns was the country on the left bank of the Weser, but sometimes the operations extended to the Rhine. The crossing of the Fulda above Cassel by the 25th Regiment is mentioned by a contemporary writer as "a proof to posterity of what determined bravery can effect." It is to be feared that posterity has no impression about the matter, except that it was foolish of Britain to expend her blood and money in German quarrels. The British troops, under the Marquis of Granby, gained useful, although costly, experience in these campaigns. The 25th Regiment was present at four general engagements besides Minden, but it would be useless to repeat names which convey no idea to the reader's mind. Peace was made towards the end of 1762. The regiment wintered at Osnaburg, and returned to England in early spring. The Prussian army now became the model for our own. We continued to worship Prussia until the victories of Napoleon. Then we cast down the German idol and erected a French idol in its place, and lately we have restored the German idol. Our management of military affairs has been often bad, while the conduct of our troops has been almost invariably good. Compare the opinion of Marshal Saxe after Fontenoy with the opinions of French generals as expressed to Sir John Burgoyne after Inkermann. "We could not have done what you did," is the substance of testimonies given at an interval of more than one hundred years.

In the year 1782 the Government determined to name the regiments of the army after various counties for the purpose of promoting the recruiting service. This was a good idea; but it was not well carried into effect, since the 25th Regiment was assigned to Sussex for no better reason than that the brother of the Duke of Richmond happened to be its colonel. However, its Scotch traditions were not easily obliterated. It still remembers that it was raised in Edinburgh, and the noble Scottish names of Leven, Rothes, Sempill, Crawford, Home, and Erskine were borne by its commanders, and it still carries the motto of the city of Edinburgh, *Nisi Dominus frustra*, upon its colours. In the same year, 1782, the regiment was embarked on board Lord Howe's fleet, and sent to the relief of Gibraltar. In 1793, being quartered in the South of England, it was selected to supply the want of marines by sending detachments on board ships of the Channel and Mediterranean fleets. Thus one detachment served under Lord Hood at Toulon, and other detachments shared in the victory gained by Lord Howe over the French fleet on June 1, 1794. The ships of Lord Howe's fleet which carried parties of the 25th Regiment were the *Gibraltar* and *Marlborough*. To the 2nd Queen's Regiment belongs the honour of having supplied a detachment to the *Queen Charlotte*, which was Lord Howe's flagship. A detachment of the 25th, employed on board the *St. George* in 1793, had the good fortune to be present at the capture of a prize so rich that the captain's share of prize-money was 1,800*l.* and the subaltern's 900*l.* The hope of such good fortune largely occupied the minds of officers of the navy during the French war, but officers of the army found many more opportunities of spending money than of getting it. The spirit of mutiny which was then so rife in the navy showed itself on board the *St. George*, and for service in suppressing this spirit a captain of the 25th Regiment received promotion. The regiment now served successively in the West Indies, in Holland under the Duke of York, and in Egypt. It was in barracks at Lewes when news came of the battle of Alexandria, and it was immediately marched to Portsmouth and embarked for Aboukir Bay. The designation of the regiment was changed in 1805 from "Sussex" to "King's Own Borderers," which it still bears. This change was made after the death of Lord George Lennox, who had commanded the regiment for the long period of forty-two years. Although the home of the Lennox family is now in Sussex, yet it came originally, like the 25th Regiment, from Scotland. In this century the regiment has been sent twice to India and once to China, and has also been employed in the West Indies, South Africa, and Canada. It had not the good fortune to serve under the Duke of Wellington, nor was it employed in the Crimean war. So much has been written about the Peninsula, Waterloo, and Sebastopol, that the earlier services of the British army are in danger of falling into unmerited oblivion. Indeed we have almost forgotten the words of Campbell's song:—

Upon the plains of Flanders
Our fathers long ago,
They fought like Alexanders
Beneath old Marlborough.

And still more have we forgotten the deeds which these words recall. In these deeds it is believed the 25th Regiment had no part. But as long as English literature survives it will be remembered that Captain Shandy was in Leven's, and that Lieutenant Le Fevre of Angus's (26th) served three campaigns with him in Flanders. Sterne's father was in Handasyde's (31st) Regiment; it is sometimes stated that he was in Leven's. This statement is repeated as a fact in one passage of the book before us, while in another passage it is treated as an error. However the truth may be, it is certain that Sterne's mother and her young children followed the drum, and his earliest impressions were

those which he has so vividly produced in *Triptram Shandy*. Few readers of his works can forget that passage where Corporal Trim tells off upon his fingers the five battalions that were cut to pieces at Steenkirke, and declares that the other battalions which tried to save them would go to Heaven for it; or that other passage where Uncle Toby describes King William III. on horseback rallying his English troops to cover the retreat from Landen. We can understand that such a King and such subjects were well suited. If in its Dutch and German campaigns Leven's gained few victories, it was never so badly beaten that it could not fight again next day.

RECENT TRANSLATIONS OF ÆSCHYLUS.*

IT is now eight years since we welcomed, in Miss Swanwick's version of the Oresteian Trilogy of Æschylus, a happier contribution to the realization of the eldest Greek dramatist in English than any scholar had previously produced. She now vouchsafes a completion of her task, and though Mr. Plumptre's translation has appeared in the interval, she retains her high relative position both as regards poetry and scholarship. The old versions of the Potter type have long been out of date, because nicer appreciation of the drift of the Greek places a wide gulf between the grand and lofty thoughts of the original and the smooth matter-of-fact attempts at an equivalent which sufficed for the readers of a couple of generations ago. Professor Blackie's Æschylus is much ahead of these, but it is not seldom erratic, and the reminiscence of it which survives our perusal some years ago is an impression of unevenness. The fault we have to find with Mr. Plumptre is rather of an opposite character. Level and commonplace, his version has no fire, no daring; it is anything but Æschylean; it represents the creditable pains of a laborious translator, here and there stimulated to make up for lack of poetic feeling by a lynx-eyed search into hidden meanings; but for the most part it is singularly ill adapted to present to English readers the highest soaring of the Attic Tragedians. On the other hand, Miss Swanwick not only has courage to do boldly the task which she has undertaken, but she unites the competent scholarship of her latest rivals with a greater facility of English equivalent expression and phraseology. Scholar enough to comprehend the niceties of the Greek—especially where she trusts the elder commentators and Mr. Paley, for we like less her adoption of conjectures from Professor Newman—she manifests withal a thorough knowledge of Shakespeare, and renders the Greek into English of the most classical type and the best accredited mintage. The plays which are now put forth by her for the first time, and which complete her task, are not indeed the most difficult or altogether the most famous of the Æschylean dramas, and yet perhaps there is no finer field for a translator than the *Prometheus Vinctus*, no series of descriptive passages likelier to repay conversion into English than the Messenger's account of the Seven Chiefs against Thebes and Eteocles's counter-array of Theban warriors, nor any more spirit-stirring narrative in dramatic poetry than the details of the battle of Salamis in the *Perseæ*. That difficult and most corrupt play of the *Suppliants* seems, as it were, to vindicate the authoress's capacity to handle problems in scholarship of the same class with those in the plays of the first volume (of which it must suffice to say that they have been thoughtfully and often ably revised); but we confess that a great deal of the conjecture bestowed on this play seems labour lost. There is this satisfaction in lingering over the *Perseæ*, the *Seven against Thebes*, and the *Prometheus*, that, through their use in schools, they are better known to the many who read little Greek than the harder plays; and our remarks on Miss Swanwick's execution of them are therefore more likely to be generally intelligible.

To begin with the *Perseæ*, it must be owned that Miss Swanwick enlists our sympathies at the very opening by turning the anapests of the chorus into a ballad-like system of eight-syllable and six-syllable rhyming lines, and not, as Mr. Plumptre does, into feeble and watery Hiawathian unrhymed measures. The latter, indeed, have a sort of semblance of being the transcript of Æschylus, from a trick imparted to them of minute rendering of epithets, and a presentment of the Greek idiom very much more akin to that language than to English. But Miss Swanwick weds flowing English to the sense of the Greek, realizes without violence the force of Æschylean compounds, and seldom fails to get as much out of her original as in this specimen line, which we take almost haphazard from the first hundred lines of the *Perseæ*—

ἰπᾶντι δουρικλύτοις ἀνδράσι τοξόδομον Ἄρη—

'Gainst spear-famed warriors leading his arrow-pulsant war.

Where, however, we more especially welcome her as a translator is in passages where she is prompted by an inborn sense of the requirements of poetry to realize the bold fancy of her model, and not to compound for it with the more prosaic equivalent of critics and commentators. In the passage where, evoked by the spell of the chorus—

Khan! ancient Khan, oh come, draw near—
Come to the topmost summit of the mound—
Lifting thy foot in saffron slipper dight,
The crest of thy tiara's kingly round
Giving to sight;
Appear Darius, blameless sire, appear!—

the ghost of Darius comes forth, and strives to interpret the position of affairs which has led his survivors to interrupt his death-sumber, one graphic and characteristic line is as follows:—

στῖνι, κίκομαι, καὶ χαράσσειται πῖδον.

The key which Mr. Paley prefers to use with this passage is the application to the verbs of the idea of the plain cut up by chariot wheels and the tramp of armies, and Mr. Plumptre inclines to this solution, though his rendering—"the whole plain groans, cut up and furrowed o'er"—is cautiously ambiguous. But we cannot doubt that Miss Swanwick seizes the true meaning, which occurred to the later scholiasts, when she interprets *στῖνι, κίκομαι* and *χαράσσειται* of the soil supposed by a bold image to present the tokens of a beaten breast, a lacerated face, and other Greek indications of frenzied mourning:—

The land breast-smitten, and with furrow'd cheek,
Mourneth.

In the same spirit of acceptance of the original poet's bolder thought, she adopts, later on in this play, the literal sense of the chief word in one of the broken utterances of Xerxes:—

Ἴάνων γὰρ ἀπήρα,
Ἴάνων ναύφρακτος Ἄρης ἱεραλκῆς,
νυχίαν πλόκα κερσάμενος
ἐνσδαίμονα τ' ἀετράν.

Though Blomfield here interpreted *κερσάμενος* "devastating," and Mr. Plumptre renders it of "a harvest reaped," Miss Swanwick has spirit, scholarship, and poetry on her side in taking *κέρσομαι* of "shearing the locks in token of grief," and rendering—

From the Ionians' might
Dire mischief did our ship-fenced Mars sustain
In shock of changeful fight;
The mournful fated coast shearing and land-bound main.

Indeed her poetic instinct is generally trustworthy, as where she elects to read in *Perseæ*, 810, *ἐκπιδύναται* for *ἐκπαύεται*:—

Nor yet is quenched the bottom of their woe,
But still it wellets up, a quenchless flood.

And yet she never rides a metaphor to death, as we submit that Mr. Plumptre does when, in the opening of the *Suppliants*, he renders over-exactly the words *τί δὲ πρῶτον*, "Playing moves on fortune's draught-board," though the sense is quite sufficiently given in Miss Swanwick's "Casting for these affairs the die." In truth, one strophe and antistrophe of her *Perseæ* will serve to give an idea of her ease, simplicity, and faithfulness—namely, 848-59, ὦ πόποι—ἀγὼν οἴκους:—

Noble and blest in sooth our city-ruling life
What time our monarch hoar,
Resourceful, blameless, unsubdued in strife,
Godlike Darius ruled our country o'er.
As chiefs of glorious hosts were we displayed,
Firm laws did all things guide,
While scatheless and unworn, when war was laid,
In triumphs to their homes our warriors hid.

The third of these lines represents the Greek words *πανταρχῆς, ἀκίκα, ἀμαχος*, one of which at least Mr. Plumptre strains unnecessarily when he renders these epithets

Meeting all wants, dispassionate, supreme;

whilst the second line of Miss Swanwick's antistrophe realizes the Greek quite as forcibly as his version:—

And laws of tower-like strength
Directed all things.

It must, however, be admitted that in some places Mr. Plumptre is more in conformity with the Greek than his fair rival. For instance, where, in the "Seven," Eteocles rates the women for wailing and lamenting the advent of the foe, Miss Swanwick misses the precise force of

τὰ τῶν θύραθεν δ' ὡς ἄριστ' ἐπέλλετ' (sc. *Theb.* 180),

Ye serve, as best ye may, the foe without;

for it is equivalent to "Ye forward in the best possible manner the enemy outside," or, as Mr. Plumptre puts it, "You do your best for those our foes without." And in a very fine strophe of the second chorus in the same play (vv. 336-49) he does more justice to the words *πρότι δ' ἄρκανα πυργῶτες* when he applies them to the city, "hemmed in by net of towers"—that is to say, enclosed in a network of circumvallation—than Miss Swanwick in her vaguer phrase, "Destruction's net draws near." There can, however, be no doubt which of the two has the advantage of spirit in the whole passage, which we give in the rendering of the latter:—

Loud clamours through the town prevail:
Destruction's net draws near,
And man by man is slaughtered with the spear:
The gory new-born wall
Of infants at the breast is heard;
There Rapine, sister of wild Tumult reigns;
Spiller to spoiler gives the word;
The empty doth the empty hail,
Seeking a partner in his gains,
Each greedily for nor less nor equal share—
In scenes like these how may we hope to fare?

But, while acknowledging the general effect of this piece of translation, we must still suspend our adhesion to the translator's postulate that *ἀρκάνα* in the original of the second verse means "the net rope with which victors swept the streets and squares, and caught runaways"; nor do we quite see how the last line of all can be dissociated, as it is in this translation, from that immediately before it.

* *The Dramas of Æschylus*. Translated by Anna Swanwick. 2 vols. London: Bell & Daldy. 1873.
The Tragedies of Æschylus. A New Translation by E. H. Plumptre, M.A. Second Edition, revised. London: Strahan & Co. 1873.

Whilst dwelling on choral passages, we are bound to testify to the success with which Miss Swanwick has turned a famous piece in the early scenes of the *Prometheus*—that in which Prometheus expresses his perception of the approach of the ocean nymphs to the scene of his torture (114-27). It is as true to the sense as it is lyrically happy:—

Hist! hist! what sound,
What odour floats invisibly around,
Of God, or man, or intermediate kind?
Who hears this rocky bound,
Spectator of my woes, or seeking aught?
A god ye see in fetters, anguish-fraught:
The foe of Zeus, in hatred held of all
The deities who throng Zeus' palace hall,
For that to men I bore too fond a mind.
Woe, woe! what rustling sound
Hard by, as if of birds, doth mine ear?
Whistles the ether round
With the light whirr of pinions hovering near.
Whatever approaches filleth me with fear.

The version of *δὴ τὴν λίαν φερόμενα βροτῶν* is simpler and more direct than Mr. Plumptre's—"and this for my great love, too great, for mortal men," which by an awkward position of words embarrasses the sense to the ear. A passage of a chorus in the *Suppliants* (56-65) about the nightingale might be cited, had we space, to exhibit Miss Swanwick's neatness of translation, or, to fall back on the *Prometheus*, another choral strophe in praise of equal marriages (vv. 906-27); but we cannot afford room even for the latter, except so far as to note how much more judiciously than Mr. Plumptre she translates the words *καὶ γλώσσαις ἐμυθολόγησεν*. The chorus praises the first who weighed the truth that to wed one's equal was best, and then gave utterance to it in maxims fashion. Miss Swanwick rightly turns it "And then in pithy phrase expressed." But Mr. Plumptre, though under no constraint of rhyme (for he does not give rhyme, even alternatively, for the choral odes of the dramas, other than the *Oræstia*), renders the words "And spread it with his speech," which is just what, as the context and common sense alike show, they do not mean.

Another of Miss Swanwick's merits is the neatness with which she renders the monostich dialogues in the *Prometheus* and elsewhere, for proof of which we must refer the reader to the plays themselves. Again, in vv. 90-105 of the *Seven against Thebes* she evinces considerable skill in breaking up the text into half-lines, spoken in their terror by the ten maidens who form the chorus, and whose ejaculations are at last summed up by the leaders of each hemi-chorus. Very good too are her versions of single lines, as witness:—

Ἄνωγ' ἵσταν' οὐ καπηλεύσειν μάχην (540 sc. *Theb.*)

Neither he comes nor peddling fight to wage;

ἀνὴρ ἀκούπος, χεῖρ δ' ὄρε' τὸ δρᾶσιμον (549 *ibid.*)

No boaster he;

But with a hand that knows the thing to do;

οὐ γὰρ δοκεῖν δίκαιος ἀλλ' εἶναι θέλει (588),

For just to be he longs, not just to seem.

Altogether, the reader of the Greek who seeks to facilitate his task by a translation combining to a creditable extent the letter and the spirit, will do well to accept Miss Swanwick's aid in a delightful study. Mr. Plumptre, however, deserves all praise for general fidelity, though without a large leaven of poetry. He is always painstaking, if sometimes it comes out too plainly in results. Occasionally he is over-subtle. Sometimes he sees too much in the Greek text, and at others sinks into commonplace and matter of fact.

Both these translators, it should be added, prefix to their versions most valuable prefatory matter. Mr. Plumptre's Life of his poet is perhaps the best thing in his book, unless it be his translation of the Fragments in an appendix, which is the more valuable because we have few versions of these, except in Mr. Darcy Thompson's *Sales Attici*. Miss Swanwick, too, is well worth reading in her studies of the several plays, and her examination of the conception of the Zeus of Æschylus, and its superficial discrepancy in the *Oræstia* and the *Prometheus*. Her introduction will be read with interest, too, by students of comparative mythology; touching as it does, if briefly, the ground which has been so fully occupied by Professor Angelo de Gubernatis and others. But, even apart from the preface and introduction, Miss Swanwick's Æschylus asserts a high rank amongst the translations of the last twenty years.

OUTLINES OF GERMAN LITERATURE.*

THE author of a compendious history of any kind, if he would be useful to the full extent which the nature of his work will permit, should mentally address himself to two opposite classes of possible readers—namely, those who are utterly ignorant of the subject of which he treats, and those to whom it is perfectly familiar. Readers of the latter class, who merely wish to refresh their memories, perhaps to arrange into a systematic whole items of knowledge not systematically acquired, filling up here and there those little interstices of ignorance which are sure to be found among the acquirements of the most laborious polyhistor, will not complain if the compendium presented to them approaches as closely as possible to the form of a catalogue or a chronological table. Should literature be the subject of the history, a list of authors, judiciously

classified, with appropriate dates and indications of birth-places, and an enumeration of principal works, will satisfy readers of this class, if it be tolerably accurate and complete, as the compendium will be taken up by them for reference, not for perusal. But completeness is indispensable; the skeleton may be entirely fleshless, but all its bones must be there, or the accomplished reader (as we may call him) will cast it aside as he would fling away a *Post Office Directory* in which the insertion or omission of streets and householders was regulated by caprice. If it is nothing else, the compendium must be a copious index, divided into sections according to some fixed and intelligible principle, and supplemented with another index arranged in alphabetical order.

On the other hand, the ignorant reader who takes up the compendium wants something precisely the reverse of all this. Above every other consideration, the book must be readable; not only stating when and where the authors lived and died, and the names of the books they wrote, with the slightest possible addition either of fact or opinion, but giving some notion of what their books are written about. To the student of this class a series of biographical essays on half-a-dozen leading authors, with descriptive notices of their principal works, would be more valuable than the fullest and most accurate collection of names and dates. If the authors can be connected together by reference to the times in which they lived and moved, so much the better; but completeness, in the eyes of ignorant readers, is the least indispensable of qualities. They have, indeed, no organs by which its presence or its absence can be recognized.

Now it seems to us that, in writing their *Outlines of German Literature*, Messrs. Gostick and Harrison have very carefully consulted the wants of the two opposite classes to which we have referred, and consequently of the various classes which may be ranged on a graduated scale from one extreme to the other. They begin with the year 380 and they end with 1870, and their alphabetical index contains the names of more than seven hundred authors. When their history becomes contemporary there is certainly rather an "ugly rush" of talent, and any given writer, unless he is a very big man, can only be recognized as one in a group, to whom no individual attribute belongs. But this is not the fault of Messrs. Gostick and Harrison. The truth is notorious that the events in the midst of which we live, whether political, historical, or other, are precisely those the importance of which we are least able to estimate, and that a broad critical survey cannot be satisfactorily taken without the assistance of the master-critic Time. The information that is given in the first chapter of the "Outlines" is, of course, as scanty as that afforded in the last, the lack and the superabundance of material practically leading to similar results. But if we take the period from the days of the Hohenstaufen to the year immediately following the French Revolution of July, we must allow that, on the whole, every author, from the Mediæval Minnesinger to the bards of Young Germany, has received as fair a share of notice as the scope of the "Outlines," which extends to about six hundred pages, will admit. To the great luminaries proportionate space is assigned, and in some cases room is found for extracts neatly translated. Of the manner in which lesser lights are treated we give the following specimen:—

GERHARD TERSTERHOEN (1697-1769), one of the latest of the platonic hymn-writers of the time, was a poor ribbon-weaver, who lived for some years on a bare diet of meal and milk and water, and gave his savings in alms to people who were even poorer than himself. He published a collection of poems under the title of *A Spiritual Flower-garden* (1731). It has no great variety of thought, but contains one fine hymn, of which an imitation rather than a translation is included in the hymn-books published by John and Charles Wesley.

Those persons, we suspect, are very few who want to know more about this pious weaver-poet than is here given; but any one who desires further familiarity is put in the way of finding it. Let us add that notices of this sort are just what is wanted by those who use a compendium as a catalogue.

Göthe and Schiller, on the other hand, are carefully followed through their career, not being assigned to separate chapters, but re-appearing at the several "periods" of the history to which their lives belong. This arrangement is most judicious, especially in the case of Göthe, who, born about twenty years after Lessing, lived through nearly the whole classical age of German literature; and any inconvenience that might be felt by a reader who would like to dispose of one man at a time is obviated by the alphabetical index, which enables any one who pleases to observe continuously the progress of the great poet. A full description is given of the two parts of *Faust* and *Hermann and Dorothea*, and an extract from *Torquato Tasso*. As a specimen of the translations we give Grotchen's well-known song:—

There lived a King in Thule—who was faithful to the grave:
His love, when she was dying—to him a beaker gave.

More prized than all his treasures—that cup of gold remained;
His eyes with tears would glisten—when he the goblet drained.

When he was old and dying—his wealth he reckoned up,
And gave all to the princes—except that golden cup!

And to his knights, all loyal—as were the men of yore,
He gave a banquet royal—in his castle on the shore.

There stood the old King drinking—one long deep health, the last,
Then down among the pillows—that sacred cup he cast.

And as the cup was sinking—he closed his eyes; no more
He drank the wine all rosy—in his castle on the shore.

The translator has allowed himself more irregularity in the metre than will be found in the original, and here and there are

* *Outlines of German Literature*. By Joseph Gostick and Robert Harrison. London: Williams & Norgate. 1873.

instances of patchwork; but the lines are not inelegant, and the translation is sufficiently close for readers who seek information.

To the mediæval poets, who are separated from the writers of the age by an interval to which no parallel can be found in the history of English poetry from the days of Chaucer, and whose existence does not seem to have been recognized till the Romantic school began to exert its influence, more space is given than might be expected in a compendium. The subjects of the "Niebelungenlied" and "Gudrun," of the "Parzival" of Wolfram von Eschenbach, of the "Armer Heinrich," of "Hartmann von Aue," and of "Reynard the Fox," are given at considerable length. Most useful and entertaining information is thus given to the reader, who may not care to devote nights and days to a study of the literature of the Hohenstaufen period, but would like to know something about it. The boon is, we suspect, to be attributed to a predilection for the old German poets on the part of Mr. Gostick, whose *Parzival and other Poems* are announced as in preparation.

The whole history is divided into seven "periods," some of which occupy many chapters. Such divisions must always be more or less arbitrary, but we do not see that the work of classification could be done more judiciously than it is by Messrs. Gostick and Harrison. The first period extends from 380 to 1150, and is chiefly represented by *Ulilas* and the poetical monk *Otfried*. The second, which may be called the Hohenstaufen period, though it reaches a point beyond the fall of that dynasty, just as we give the name "Elizabethan" to dramas written during the reign of the earlier Stuarts, brings us down to the year 1350, and includes the old epics and the lyrical works of the Minnesänger. The third, terminating with 1525, and the fourth ending with 1625, include the rhyming townsman called "Meistersänger," with the shoemaker *Hans Sachs*, *Luther*, and the Reformers, the mystic *Tauler*, the theosophist *Jacob Böhme*, and many writers of Lutheran hymns. In the fifth period, extending from 1625 to 1725, modern German poetry modestly begins with the first Silesian school, headed by *Martin Opitz*, whose mild respectability is favourably contrasted with the monstrosities of the second Silesian school, represented by *Hoffmann von Hoffmannswaldau* and *Lohenstein*. Here also German philosophy may be said to commence, in the person of *Leibnitz*. The sixth period, to which belong the first twenty years of *Goethe's* life, reaches to 1770, and is rendered attractive by the names of *Klopstock*, *Wieland*, and the far greater *Lessing* and *Winckelmann*. The seventh brings us down to 1870, and comprises all the recognized chiefs of German literature and philosophy, if we add the name of *Lessing* to the list.

Great pains are taken to show the various authors as representatives of the times in which they lived, and a political and social background is always visible behind the figures under consideration. The "Sturm und Drang" clique, with whom *Goethe* passed his youthful days, and who seem to have worshipped *Shakespeare* because he disregarded the unities of time and place; the far more brilliant "Romantic school," with its mystical aspirates, its nationality, and its Romanizing tendencies, and other literary combinations, are all brought clearly to the view, and the individuals of whom the groups are formed are defined with clear outlines. As a specimen of the way in which an exceptional man is treated, we may refer to the notice of *Wieland*, who, much as he was admired by *Goethe*, does not readily fall into any group. By a chronological arrangement, he is associated with *Lessing*, *Winckelmann*, and *Klopstock*, but with them he had no connexion. Among the younger and greater poets whom he met at Weimar he stands as a figure that by no means belongs to the general picture. No poet was more read and admired by the aristocratic public of Germany than *Wieland* in his day; no poet is less cared for now. It is quite possible that a person who, trusting to unassisted memory, made a collection of classical German authors, would leave his shelves unencumbered by the voluminous works of the forsaken idol. Why so much popularity a hundred years ago and such scant celebrity now, in the case of a man who wrote in a fluent, easy style, who never treated subjects of merely local interest, and who is as intelligible to a modern reader as he was to the German princes of the last century? The problem is neatly defined by Dr. *Vilmar*, whose words are quoted in the "Outlines":—

Wieland is the man of his time for readers vitiated with the subtle and secret poison of the French literature then current, especially for the higher classes, to whom thinking was tedious and enthusiasm ridiculous. To such people, who had formerly been dependent on the French, *Wieland* introduced a German literature well suited to their taste, and it is mainly by their interest in the materials of his works that we now understand why he received during his life such praises as were hardly bestowed on *Klopstock* and never on *Lessing*.

Wieland's position was indeed curious, and would have been impossible in a country where the vernacular language was spoken by the whole people or permanently confined to the lower classes. *Frederick the Great* and his associates would not read German at all, and if the fashion of his reign had continued, there would have been no room for a *Wieland*. But before the death of the great King, princes and nobles had discovered that it was possible to talk German in high society and even to skim over German books. What was required under these circumstances was a writer, thoroughly French in mind, who could tell stories worthy of *Crébillon* *Mé* in the language of Fatherland. Such a man was *Wieland*, and the fame of such a man must necessarily diminish when the transitional period to which he belongs is past.

Far more space is allowed to German philosophy than might be

expected in a work of such limited compass; and when we consider the extreme difficulty of the subject, we must admit that the connexion between brevity and obscurity, against which we are warned by *Horace*, is creditably avoided. Messrs. Gostick and Harrison apparently belong to what is called the Right division of the Hegelian school, and they are very anxious to show that materialism and infidelity are not necessary results of German philosophy. Materialism, as they rightly observe, is as old as the time of *Democritus*, and was propounded in the last century by the Frenchman *Lametrie*. They might have added that its influence has largely increased since the cessation of the rage for metaphysics which marked the first third of the present century. The repugnance to miracles which characterized that "old rationalism," at once innovating and timid, which is laughed to scorn by the holder *Strauss*, may be traced to the English deists, represented in France by *Voltaire*, and to *David Hume*. The deliberate effort to upset the Scriptural Canon, which is the occupation of the so-called "Tübingen school," certainly belongs, in its completeness, if not in its origin, to Germany; but our authors justly observe that the leaders of that school do not represent any system of philosophy, but are mainly historical and philological critics. We are willing to concede that materialism, and the sort of atheism with which it is associated, are more repugnant to the spirit of German philosophy, distinctively so called. But when we survey the metaphysicians who came after *Immanuel Kant*, we find that a certain spiritual tinge seems to pervade them all. The Absolute Ego of *Fichte*, the Absolute of *Schelling*, the Absolute Idea of *Hegel*, all appear expansions of the doctrine which recognizes the *ἐν καὶ πᾶσι*, and the fact will be borne in mind that, although *Spinoza* was a Dutch Jew, the respect with which he is now treated, and the tenderness with which he is handled even by those who are opposed to his theories, date from the commendation bestowed upon him by German professors more than a hundred years after his death. *Schopenhauer* indeed glories in his atheism, and regards the word "Pantheism" with contempt; but we need scarcely say that his atheism is of a spiritual kind, akin not to the doctrines of the materialists, but to the religious Nihilism of the Buddhists.

ILÂM EN NÂS.—ARABIC TALES.*

THESE Arabic tales, or, as the author calls them, "Warnings for Mankind," consist of a succession of stories and anecdotes of the days of the early Khalifas, or Caliphs, as we have been accustomed to call them. The Khalifas themselves and the distinguished men of the time are the subjects of many of the stories. The tales were collected, as the author tells us, at the request of his pious brethren, and the title which he has given his book indicates the object he had in view, that of teaching by example. He does not point the moral, but leaves the reader to make his own application. And herein he has been wise; for some of the stories have been chosen more for their pleasantness and smartness than for any very obvious moral. But there is a high tone about them, a love of justice, of truth and integrity, a sense of honour and manliness, and a simple devotion to religious duty, which, however mistaken according to our lights, is deserving of every respect. They exhibit the Arabic character in a very pleasing light, and after making allowance for difference of law and custom, there is nothing in them to offend and call for censure.

The first story in the book is told of *Omar*, the second Khalifah. Going about among his people to make himself acquainted with their condition, he heard an old woman complaining that the ruler had never bestowed the smallest gift upon her. "But," said he, "how is it possible for *Omar* to know anything of your condition, and you living in such a place as this?" "The Lord be praised," she cried. "By Allah! I could not have supposed that a ruler over men existed who was in ignorance of anything that occurred between the east and west of his dominions." Without disclosing who he was, *Omar* compounded with the old woman for her wrongs by paying a sum of money, and took from her a regular discharge attested by witnesses. This deed he gave to his son and said, "When I am dead lay this in my winding-sheet, that I may appear with it when I rise in the presence of the Lord." The duty of restitution and atonement for wrong is strongly enforced by Musliman law and morality, and the necessity of appearing before the Great Judge free of accusers has often prompted a course of procedure similar to what is here described. History records that one of the Emperors of India, whose predecessor had been a bloodthirsty tyrant, paid the price of blood to those who had been mutilated and to the relations of those who had been put to death. For these payments he took regular receipts, which he placed in a chest and deposited in the tomb of the deceased monarch, so that they might prove available when the recording angels should cast up their accounts.

Another story of this same Khalifah is alike honourable to him, and to the other actor in it. *Hurmuzin*, a Persian prince and fire-worshipper, was taken prisoner and offered the usual alternative of death or conversion:—

The prisoner cried, "O, Commander of the Faithful, before you kill me give me a draught of water, and do not slay me parched with thirst." So *Omar* ordered some water for him, and so soon as *Hurmuzin* had the goblet in his

* *Ilâm en Nâs: Historical Tales and Anecdotes of the Times of the Early Khalifas*. Translated from the Arabic, and annotated by Mrs. Godfrey Clerk, Author of "The Antipodes and Round the World." London: Henry S. King & Co.

hand he asked, "Am I safe until I shall have drunk it?" To which Omar replied, "Yes, safety is yours for that time." Then Hurmuzan flung the vessel away from him and spilt the water, and cried, "Your promise, O Commander of the Faithful!" So Omar said to the executioner, "Leave him whilst I find out what is to be done with him." And when the sword was removed from over him Hurmuzan exclaimed, "I testify that there is no God but God, and that Muhammad is the prophet of God!" Then said Omar, "Verily thou hast professed the best form of Muhammadan faith. What caused thy delay in doing it?" "I feared," he replied, "that it might be reported I had professed el Islâm through dread of the sword."

Love stories of course have their full share of attention. Several of these turn upon the great facility of divorce which the Muhammadan law affords. A man who had gone through a succession of misfortunes, and had become destitute, had his wife taken from him by her father. The husband complained to Marwân, the ruler of the province. He, on seeing the wife, became enamoured of her, and tortured the husband until he extorted a divorce from him. After the completion of the period laid down by the law, the governor married the woman, and the husband was turned adrift. The injured man went complaining to Muâwiyah, the ruling Khalifah, who wrote commanding his official to divorce the woman and send her to him. This was done. Muâwiyah himself, on seeing the woman, admired her greatly, and offered the man great bribes to give her up. He refused, and expressed the strength of his feelings in verse and energetic prose. The Khalifah urged that the husband had already divorced her, and so he determined to leave all to the choice of the woman:—

"Speak," he cried, "which is dearest to thee, the Commander of the Faithful with his power and his rank, and his palaces and his empire, and his wealth, and all that thou hast seen around him; or Marwân with his tyranny and his injustice; or this Arab with his hunger and his poverty?" So she recited, saying,

"This one. And even in hunger and want
He were dearer to me than my kin and my friends,
And the wearer of the crown, or his vicegerent Marwân."

By Allah, O Commander of the Faithful! I am not going to forsake him because times have changed, nor because the days are darkened. Neither let it be forgotten that I have been his companion from the first, and our love is not worn out. And it is right that I should be the one to bear patiently with him in adversity who have with him been happy in brighter days."

Then Muâwiyah marvelled at her wisdom, and at her affection for the Arab, and her fidelity to him. And he gave her ten thousand dirhems, and gave the same sum to the Arab, who took her and departed.

This breaking forth into verse on such an occasion seems unnatural and forced to our more reserved and colder natures. But there is nothing in it unusual or strange to the Arab mind. It is common in this and in similar books. The art of verse-making is much more generally cultivated among the Arabs than with us; the language more readily assumes a poetic form, and the temperament of the nation is fervid and impassioned, so that whenever the feelings are wrought upon it seems quite natural, and it certainly is considered quite proper, to give them expression in verse.

It would be strange if in a book of this character we were to meet with no mention of Solomon, the son of David. His supernatural powers over all creatures is a favourite topic of Muslim fabulists and story-tellers. Here we have the absurd story of his amour with Queen Balkis, by many identified with the Queen of Sheba; and not without reason, for she is represented to be a descendant of Saba, queen of the country of Saba, and a worshipper of the Sun. There are various versions of this story, but the main points of it are to be found in all. The story before us begins with telling us that "God taught King Solomon, son of David, the language of all created beings. And over all things He gave him power—men and genii, and the beasts of the earth, and the fowls of the air, and the fishes of the water." It was this marvellous power, as we read elsewhere, that enabled him to build the Temple of Jerusalem, for the genii and all creatures were pressed into the service as necessity required. The foundation of this story is found in the Koran, and the Prophet no doubt derived the idea of it from the Old Testament. A little bird, one of Solomon's emissaries, informed him of the beauty and dignity of Queen Balkis. The report piqued his vanity. He sent to invite and enforce a visit to his Court. She came, and according to the Koran, on entering the palace, she saw what "she imagined to be a great water, and she discovered her legs, by lifting up her robes to pass through. Whereupon Solomon said unto her, 'Verily this is a palace evenly floored with glass.'" These words have occupied the attention and exercised the critical powers of many grave doctors and learned theologians, and the upshot of their speculations is that this floor of glass was a device specially contrived by Solomon to ascertain the truth of an aspersions upon his illustrious visitor's person. The mother of Balkis was a *jinn*, and the *jinn* or genii were apprehensive lest Solomon should marry her, and so transmit to his offspring that power over them which he himself possessed. To prevent a marriage, a *jinn* informed Solomon that the Queen's "mind was weak and her feet like the feet of a donkey"—other authorities carry the disfigurement a little higher and say that her legs were hairy. When she came to this glass floor under which there was water "and in the water fish and frogs, she drew up her garments and exposed her feet; and the King saw that the *jinn* had lied." Those who adopt the second version, say that the statement was true, and that Solomon made a depilatory preparation which removed the blemish. Whichever be the better version, the same end is arrived at—"Solomon married her, and he loved her exceedingly and made her Queen again over the land of Yemen."

There are many anecdotes and stories of women, of their ready wit, shrewdness, and ability, also, as it said, of their power over men, and of considerate and gentle treatment at their hands. Their rights fall far short of the rights of women clamoured for in these days, but women were certainly not afraid of expressing their opinions, nor were their wishes and opinions without an influence much greater than their inferior social position might lead us to suppose. Take the following anecdotes:—

Misân, the daughter of Bâhdal, was married to Muâwiyah, and he brought her from amongst the wandering Arabs into Damascus. But she sorrowed exceedingly for her people, and at the remembrance of her home, and one day he heard her reciting and saying,

A hut that the winds make tremble
Is dearer to me than a noble palace;
And a dish of crumbs on the floor of my home
Is dearer to me than a varied feast;
And the sighing of the breeze through every crevice
Is dearer to me than the beating of drums;
And a camel's-wool garment which gladdens my eye
Is dearer to me than filmy robes;
And a dog barking around my path
Is dearer to me than a coaxing cat;
And a restive young camel following the litter
Is dearer to me than a prancing mule.
And a feeble boar from 'midst my cousinhood
Is dearer to me than a rampant ass.

Upon hearing these lines Muâwiyah exclaimed, "The daughter of Bâhdal was not satisfied until she had likened me to a rampant ass!" And he ordered her to be packed off again to her family in the desert.

Several stories are told about the monster El Hajjâj Thakfi, the bloodthirsty satrap of Yemen, whose atrocities were so many and so enormous that historians have been driven to form theories to account for his violence and tyranny. The numbers said to have perished under his commands exceed all belief, but it is agreed upon all hands that he was "a monster of cruelty." Yet even he was derided and humbled to the dust by a woman. He married a celebrated beauty named Hind, and settled two hundred thousand dirhems upon her as dower. She was well educated, and as high-spirited as she was lovely. One day Hajjâj heard her repeating some lines which she had composed about him, and which were by no means complimentary. He was greatly enraged, and determined to be quit of her. His wealth enabled him to break that chain of dower which many a Muhammadan husband has forged for himself, so he sent one of his attendants to take her the dower, and to "divorce her in two words." When the messenger had performed this office, she said "I was his wife, but I did not glory in it, and I am repudiated, but I do not regret it. And as for this two hundred thousand, it is thine for bringing me the good news of my deliverance from that dog of a Thakfi." The Khalifah heard the fame of her beauty, and sought her in marriage, but she replied that she had "already had one dog of a husband," and upon one condition only would she accept the offer. If she consented to marry, her late husband must conduct her litter, walking barefoot, but otherwise dressed as usual, from her own country to the Khalifah's abode. The command was given, and the lieutenant had no choice but death or obedience. So he performed the task, and as they journeyed on she mocked and derided him, and although he retorted that he had "forsaken her like a thrown-off garment," she kept up her gibes till they neared their journey's end. She then dropped some dinârs (gold coins) and called out, "Stop, I have dropped some dirhems" (silver coins), "pick them up for me." So El Hajjâj looked on the ground, but seeing only dinârs, said, "They are dinârs." "Not so," said she, "they are dirhems." He repeated "They are dinârs." Whereupon she exclaimed, "Allah be praised! Dirhems fell from our hands, and Allah has replaced them by dinârs." Then El Hajjâj, taking the hint, was covered with confusion, and was silent and made no answer, but went with her into the presence of the Khalifah, who married her. And according to her will so was everything."

We have quoted enough to show that this is an unusually interesting book. We must now call attention to the fact that the translation is the work of a lady, and a very excellent and scholarly-like translation it is; clearly and pleasantly written, and illustrated and explained by copious notes, indicating considerable learning and research. A scholarly knowledge of Arabic has hitherto been supposed to be the exclusive privilege of a limited number of men, but here we find a lady who has not only acquired the language, but is evidently filled with an enthusiastic admiration of its literature. Her knowledge of the language, as appears from the book, was acquired in Cairo, her residence there having been enforced by the delicate health of her husband. She has made excellent use of her opportunity, and is entitled to the motto which she has prefixed to her book—"Man dhâburas hafara," "Who endures conquers"—for she must have persevered long and resolutely before she attained the proficiency which the volume attests. Her studies, however, were not without an alloy. There is, according to Muhammadans, a book which is called the "Mother of Books." On one side of this are written the names of all good Muslims, and on the other the names of infidels and bad Muslims. The *shâikh* who was her teacher solemnly and persistently told her that, however perfect and good she might be, she could never hope as a Christian that her name would be inscribed upon the former, and so there was no chance of her obtaining salvation. The present volume, it appears, is but a portion of the original work. We hope the translator may receive such encouragement as may induce her to continue her labours.

SEEN AND HEARD.*

MR. GARRETT, the author of *Seen and Heard*, has struck out a happy device, and has been original where originality seemed almost impossible. He has managed to write thirteen sermons, each of which is provided with a plot. There have been story-writers who have often indulged in sermons, and there have, though far too rarely, been sermon-writers who have occasionally tried to keep their congregation from slumbering by a story. But Mr. Garrett, who properly is no story-writer at all, but much rather a man given to preaching, has, as we have said, managed to strike out a new kind of sermon which shall have all the characteristics of an ordinary sermon—such as length, dullness, thoughts ill considered and worse expressed—and yet shall have a kind of a story running through it. He doubtless thinks that he is a writer of stories and not of sermons, but in this he is surely mistaken. For each one of his stories that we have read bears the one mark which more clearly than anything else distinguishes your genuine sermon.

Now that mark, we take it, lies in this. A sermon is that kind of composition which would read equally well if the leaves on which it is written were unstitched, were shuffled together, and were then read in the order into which they were thrown by chance. Of course we do not mean to say that there would not be need of some slight corrections, so as to make each sentence have a nominative case and a verb. But this is almost a mechanical process, and, like the stitching together of the leaves, might be safely left to the parson's wife. There is this convenience in compositions of this kind, that you never lose your place. Whether it be that we nod in church, or that in reading we take up the second volume while the end of the first volume is still unread, in neither case do we notice any awkward gap, or find any greater difficulty in following the thread of the composition than that which arises from a strong desire to go to sleep. A story is told of the eminent Dissenting preacher who took to himself the appellation of Sinner Saved, that, having in answer to his prayers for some breeches received a pair that fitted him admirably, in returning thanks for the mercy vouchsafed to him he showed his congregation that the fit was so good that it was quite clear an angel must have guided the shears. The title of *Seen and Heard* likewise so admirably well fits Mr. Garrett's stories that he will not, we trust, suspect us of flattery when we state that it is quite clear that one of his angels must have guided his pen. We have indeed both seen and heard all that he has written far more often than we like. Our youth happily was not altogether a godless one. On Sundays we were for a long course of years privileged to hear the vicar in the morning and his curate in the afternoon, while our youthful appetite was not stinted in tracts. From certain circumstances our reading of what is called good books has always been unusually large; while of late years our duty as reviewers has only too frequently made us acquainted with Mr. Garrett and other moral writers of his school. It may be the case, however, that from an excess of modesty Mr. Garrett has chosen the title of his book, and in the honesty of his heart gives his readers a warning that they must expect nothing new. To use his own peculiar English, it is just possible that the name of the book may be as "deprecatory" as was the remark of his sister, when she is made to say in the introduction that she was "afraid people would call them very commonplace stories." From whatever source the title springs, it is a most descriptive one, and altogether cuts off the reader from any right to grumble at finding nothing new. It is somewhat hard for a reviewer to have to give any account of such a book as this. So utterly colourless it is that when we look at the titles of the stories we have so lately read we do not remember in the least what they are all about. We have a general impression that there were a good many people who began by going regularly to chapel twice every Sabbath, were seduced into going once to the theatre, and straightway went to the devil. There were other people who were happy as long as they were poor, went to chapel, and wore dresses that had been turned and returned, but became miserable when they grew rich, went into "a great pew in a fashionable church," and, in defiance of the laws of the land and of good eating, in "the dawn of summer," dined on "roast partridges, almond pudding, and strawberries." We did, indeed, as we read, take a few notes of some of the stories; but they fail to remind us with any distinctness, now that we look through them, of the various plots.

In the first of the stories that we have thus noted we find that a mother dies and there is a case of brain-fever. In the second a father dies and also a son. In the third a child dies. In the fourth chapel people begin to keep grand company, and then there are seen before long "blood stains on the floor of the fashionable hotel" which the young men of the family frequented. The fifth story is a case of small-pox, and the sixth of spinal complaint. We must do the author the justice to admit that good people die nearly as often, though not quite so rapidly, as theatre-goers. For while bad people are killed off to punish them, good people are killed off to show, to use Addison's words, "how a Christian can die." If Mr. Garrett's account of human nature and of the bills of mortality is correct, the surest chance of a long life would seem to lie in keeping the golden mean between an excess of virtue and an excess of vice. He who would live to see his children's children

must be neither bad enough to frighten sinners by his early death nor good enough to encourage saints. He should be sensuous enough to eat roast partridges and almond pudding in May, so as to render himself not worth killing off for his virtue; but he should keep out of the theatre and in the chapel, so as to secure himself against being killed off for his vice. If we had to choose between the two, and considered nothing but length of days, we are not sure that we would not rather just now be over-bad than over-good. For in modern novels there has been such an alarming increase in the rate of mortality among the good as almost to call for an inquiry by one of the Sanitary Inspectors.

It is a pleasure to find that Mr. Garrett has the satisfaction of looking down upon "trumpery weekly journals and nonsensical novels." He should not, however, be too hard-hearted upon his fellow-authors; for even if they had done nothing but study his writings, yet, good and sound though these are, they would nevertheless in their minds soon have turned into what, with a certain homely vigour of language, he calls "muck of indolence." The whole passage in which this agricultural image occurs is worth quoting:—

But, do you know, I think God himself empties us of our faith sometimes. You see every good thing that gets into our hearts is like clear water poured into a dirty basin, after it stands a little while it gets fouled and cloudy—a sediment of self-righteousness at the bottom and muck of indolence at the top. And when God sees that, He turns the stop-cock, and drains it all out, and may be uses some very sharp tools to put the reservoir into better repair. Then we can't help being miserable, but we ought to be as contented to bear the misery as we are to bear the pain which we pay the dentist to give us, that we may get rid of a useless tooth.

When we come upon such a passage as this, we are not only ready to admit with our author that "a spirit can do as well without a head as with one," but to allow that when such things are put before us to be seen and heard, we also can do as well without, at all events, our eyes and ears as with them. It may be that such stories as these have their appointed place in the world, and find people who are sufficiently near to the saint in absence of head, or, at all events, of brain, to be improved by them. It may be that young people who are going the primrose path to the everlasting bonfire will take warning from the examples contained here, and, renouncing "dancing-dens," theatres, roast partridge, and almond pudding, will return "to the Zoological Gardens and the Polytechnic, with refreshments of ginger-beer and penny buns," while on the Sabbath they will "cheerfully settle themselves down with Newton's *Cardiphonia*." Should such a result be produced by the seed scattered abroad by these stories—and we must remember, as our author tells us, that "God does not plant boiled seeds"—we ought not perhaps to criticize too severely the means by which so good a work is brought about; for, again to quote Mr. Garrett, "how can one say a slighting word of the roughest rope that has saved a drowning man?" We can only wonder how so good a man has so bad a style; just as people wondered in Goldsmith's poem how so good a man could have been bitten by so mad a dog. Though, as Mr. Garrett tells us, "the angels smile at our aesthetics," yet we hope that it is not inconsistent with true piety to have a little regard to taste in our compositions. If John Howard is to be abused, let him not be abused in English that requires reforming as much as the worst prison that he visited. Before Mr. Garrett writes again we hope that he will, even at the risk of incurring an angelic laugh, study aesthetics sufficiently to avoid such an awkward sentence as the following:—

Of course I had read them, I may say before he was born, and I liked them very well, only I was sorry Howard did not pay more attention to his own son, and also that he begrudged the comforts of the little Bluecoat boys, who seem to me to deserve consideration as much as prisoners in dungeons; though they do say many get into the school whose parents could very well bring them up elsewhere, which is a shameful thing, but it only seems to me that those boys need the more pity for belonging to such sneaks.

The homeliness of such writing as this is at times relieved in *Seen and Heard* by some very big words, words indeed so big that the author cannot manage them with any certainty or skill. We have not only "aesthetics" and "deprecatory" for depreciatory, but we read of "the idiosyncracies of a home," of a nurse who "would softly carol the sweet pathos," and of "the heart-rending phantasmagoria of sea-sickness." No doubt the author speaks from experience when, to the great comfort of all who may follow in his steps, he says, "whatever nonsense you may write, somebody will be always ready to read it." We do not know how this is to be remedied, unless the Government will include novels among the articles which shall be subject to the inspection of the Officers of the Boards of Health. It might not perhaps be impossible to invent some mechanical means of ascertaining the amount of common sense in a book, as there are means of ascertaining the amount of milk in the mixture sold by people who are strangely enough called milkmen. In that case, those who by a long course of silly reading have got their taste hopelessly spoiled would be protected against themselves, and, however much they wanted it, would no longer be able to buy any more fresh nonsense. What, in that case, would become of such authors as Mr. Garrett and the writers of tracts is a melancholy consideration. Those who have at present to review their books would with a cheerful heart willingly subscribe to any fund that should be raised for their support on the silent system; while those who had in earlier days by their warning voice been turned away from the extravagant pleasures of fashionable life would doubtless contribute a portion of the money they had saved by eating penny buns instead of almond pudding, and by drinking ginger-beer

* *Seen and Heard*. By the Author of "Occupations of a Retired Life," "Premiums Paid to Experience," "The Crust and the Cake," &c. 3 vols. London: Strahan & Co.

instead of choice wine, towards providing their ancient benefactors with a daily supply of those wholesome and cheering refreshments. Such, indeed, is the good impulse that we at least, as reviewers, now feel. But then, as Mr. Garrett says:—

In profane, unconverted men, good impulses are but weaknesses—fatal inconsistencies in wickedness which surely ruin them for the world which now is, without availing them for that which is to come.

We are afraid, therefore, that if we can ever get these pious passers silenced, it will be our duty, however grateful we may feel at being relieved from the wearisomeness of reading their writings, to be on our guard against any good impulse that should lead us to contribute to their support. Certainly, as we are painfully conscious that we are what Mr. Garrett means by "profane, unconverted men," we shall sternly resist the good impulses that may ever come upon us either to eat penny buns or to drink ginger-beer, or to settle ourselves cheerfully down to a study of Newton's *Cardiphonia*.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newagent, on the day of publication.

ST. BARTHOLOMEW'S HOSPITAL and COLLEGE.—SCHOLARSHIPS IN SCIENCE.

Two Scholarships in Science have been founded at St. Bartholomew's Hospital:
1. An Open Scholarship of the value of £100, tenable for one year, to be competed for in September. The Subjects of Examination are Physics, Chemistry, Botany, and Zoology. The Successful Candidate will be required to enter at St. Bartholomew's Hospital in October next.
2. Preliminary Scientific Scholarship of the value of £50, tenable for one year, to be competed for in October next. The Scholarship in Greek will be held on the 10th and 12th of September next; and that for the Scholarship in Hebrew on the 20th and 22nd of September next. The Subjects of Examination are identical with those of the Open Scholarship.
For further particulars and syllabus of subjects, application may be made, personally or by letter, to THE WARDEN of the College, St. Bartholomew's Hospital.

UNIVERSITY COLLEGE, London.—HOLLIER SCHOLARSHIPS IN GREEK and in HEBREW.

One of these Scholarships may be awarded for Greek and one for Hebrew in each year. They are tenable for two years only, and their present value is about Sixty Guinea each.
The First Examination for the Scholarship in Greek will be held on the 10th and 12th of September next; and that for the Scholarship in Hebrew on the 20th and 22nd of September next. Notice in writing of intention to compete, with certificates of age and good conduct, must be sent to the Secretary on or before Saturday, August 30.
Copies of the Regulations relating to the Scholarships may be obtained at the Office of the College.
July 28, 1873. JOHN ROBSON, B.A., Secretary to the Council.

COOPER'S HILL COLLEGE.—The following are the Names of some of the SUCCESSFUL COMPETITORS at the recent Examination for admission to the Indian Civil Engineering College:

Names.	Marks.	Names.	Marks.
Simeon, Lionel Harrington	180	Stewart, Robert	144
Chubb, Henry James	180	Holmes, Charles Henry	140
Reynolds, George Bernard	180	White, John Claude	130
Coode, Montgomery P.	167	Johns, Edward Henry	123

Pupils of Mr. J. ASHTON, 4 King Henry's Road, 8, Hampstead, who receive RESIDENT and NON-RESIDENT CANDIDATES. N.B.—Ten were sent up, eight passed.

LONDON INTERNATIONAL COLLEGE, Spring Grove, near Isleworth.—The AUTUMN TERM COMMENCES on September 18.—Further information may be obtained by applying to Dr. LORENZ SCHMIDT, the Principal, at the College.

TRINITY COLLEGE, GLENALMOND, Perth.

Warden—Rev. R. THORNTON, D.D.
A School on the model of the greater Public Schools in England. There is a resident Medical Officer. For particulars apply to the WARDEN.
The School will meet on Tuesday, September 9.

BRIGHTON COLLEGE.—

President—The Earl of CHICHESTER. Principal—The Rev. C. BIGO, M.A., late Senior Student and Tutor of Christ Church, Oxford. There are special Modern Forms, affording every necessary preparation for the Indian or Army Examinations. The School is well endowed and is perhaps the healthiest public school in the kingdom.—Apply to the Rev. the SECRETARY.

THE EASTBOURNE COLLEGE.

Established 1867.
President—His Grace the Duke of DEVONSHIRE, K.G., &c. &c.
Vice-President—The Lord Bishop of CHICHESTER.

The Right Hon. the Earl of CHICHESTER.

The Right Hon. the SPEAKER of the House of Commons, &c. &c. &c.

Head-Master—The Rev. THOMPSON FODMORE, M.A., First Classman in Classics, and late Fellow of St. John's College, Oxford.

Master, Modern School—The Rev. G. R. GREEN, M.A., late Scholar of Lincoln College, Oxford.

The ensuing Term will commence on Thursday, September 18. Boarders to return the previous afternoon.

For particulars apply to the HEAD-MASTER, or the Secretary, Major GARRARD, the College, Eastbourne.

THE EASTBOURNE COLLEGE.—There will be an Examination in December for an OPEN SCHOLARSHIP of £50 per annum, tenable in the College for Three Years.

GARRICK CHAMBERS.—The next Term will commence

on September 16. The Honour List for the years 1860-1873 contains the Names of 127 SUCCESSFUL PUPILS, appointed to the following Departments:

67 to the Civil Service of India.
9 to Attachships in the Diplomatic Service.
13 to the Foreign Office.
34 to other Superior Offices of the Home Civil Service.
11 to the Cayton Civil Service and to Chinese Interpretships.
3 to the India Engineering College.

Of this number 36 gained the First place in their respective Competitions.

The List may be had on application, by letter, to the LIBRARIAN, Garrick Chambers, Garrick Street, London.

WIMBLEDON SCHOOL, SURREY, S.W.

Head-Masters.

Rev. JOHN M. BRACKENBURY, M.A., of St. John's College, Cambridge.

Rev. CHARLES J. WYNN, M.A., of Jesus College, Oxford.

Assisted by Nine Resident Masters and other Professors.

The chief aim of this School is to combine the tone and discipline of the Great Schools with special means of advancement in all the different Studies that have been introduced into the Competitive Examinations for Military, Naval, and Civil Appointments.

The School, which is limited to One Hundred Boys, is divided into small Classes, so that each Boy receives much individual attention.

The Honours obtained during the last Ten Years include Eighty successful Candidates for the Competitive Examination for Woolwich and Navy, and of these Six have at different times obtained the First Place on the Lists.

At the Examinations held last May, Four were successful for Woolwich, Four for Direct Commissions, and Two at the Examination just concluded for the Indian Civil Engineering College at Cooper's Hill.

The NEXT TERM commences on Tuesday, September 2.

For further particulars apply to either of the HEAD-MASTERS.

EDUCATION, SUPERIOR.—THE WICK, Brighton.

The following Distinctions have been recently obtained by PUPILS of this School, viz.: Balliol Scholarship, Woolwich Cadetship, 3rd in the last Examination, and Class in the last Classical Moderations, &c. &c. House stands in its own grounds of eight acres. Separate Cricket-field. A Junior department for Pupils preparing for Public Schools.—For Terms, apply to the PRINCIPAL, The Wick, Brighton.

THE ENGLISH LECTURER at several high-class Colleges

for LADIES, is open to fresh ENGAGEMENTS.—Address, E. C. L. Farmer & Son's Library, Edwards Terrace, Kensington.

KENSINGTON.—Six Resident and a few Non-resident

PUPILS are received at 25 Addington Gardens South, by Mr. FREDERIC NASH, formerly Head-Master of the Kensington College School. Terms on application.

FOLKESTONE.—Mr. W. J. JEFFERSON, M.A. Oxon

(formerly Principal of the Elphinstone High School, Bombay), will continue, with the assistance of a Cambridge Honorary Man, to prepare PUPILS for the Universities, Indian Civil Service, Woolwich, and all Competitive Examinations.—Terms and References on application.

INDIAN CIVIL ENGINEERING COLLEGE, Cooper's Hill.—CANDIDATES for admission are specially prepared by the Rev. Dr. WAGLEY, M.A., B.D., F.R.S., formerly Professor of Mathematics, Addiscombe, and late Examiner of Candidates for Appointments in the Indian Civil Engineering Service. Pupils may be Resident or Non-Resident. Address, 67 High Street, Cheltenham, S.W.

COOPER'S HILL.—The Rev. W. H. JOHNSTONE, M.A., Remington House, Croydon, late Professor and Chaplain at the Engineer College, Addiscombe, and Assistant Examiner for Indian Appointments under the Public Works Department, has just passed two PUPILS for COOPER'S HILL.

WOOLWICH.—ARMY DIRECT and CIVIL SERVICE.—Rev. Dr. HUGHES (Wreagh, Cam.), who has had Twenty years' success in preparing for the above, receives TWELVE YOUNG MEN. Entirely separate TEN BONS. Rating, W.

DIRECT COMMISSIONS.—No Pass no Pay.—A WRANGLER, six of whom Pupils were successful last time, is prepared to receive CANDIDATES on the above terms. N.Y., Hambley's Library, Gloucester Road, N.W.

STOKE HOUSE, near SLOUGH.—The Rev. E. ST. JOHN PARRY intends to MOVE during the coming Midsummer Holidays to STROKE HOUSE, in the Parish of STROKE PILES. The House stands in its own ground of nearly Eight Acres. There is a good Playground, Cricket Field, and every requisite for a School. Boys from Nine to Fourteen Years of Age will be prepared, as heretofore, for Entrance at all the Public Schools, and with Especial Reference to the Competitive Examinations for Scholarships. For further particulars address, till August 12, to Tudor House, Dordham Down, Bristol; after that date to Stoke House, near Slough.

EDUCATION.—PORT ELIZABETH, Cape of Good Hope.—WANTED, for the PUBLIC SCHOOLS upon the Grey Foundation a RECTOR, salary commensurate with rank. The Applicant must be a Graduate of one of the Universities of Great Britain or Ireland, must have been engaged in the actual work of Tuition for several years, must be able to furnish Testimonials of Competence as a Teacher, must be able to give the highest Testimonials as to Moral Character, and must be a Married Man, or one whose age shall not be less than Thirty years.—Printed documents relating to the above can be obtained from A. EMMETT, Esq. at the Office of JAMES STRAIGHT, Esq. 17 East India Avenue, London, or from the Rev. J. COTTELL, 1 Elcho Terrace, Portobello, N.W. To whom alone letters requiring written answers must be addressed. The following Gentlemen have undertaken, at the request of the Board of Managers, to select the Rector:—The Bishop of Edinburgh, The Rev. J. HANCOCK, A. EMMETT, Esq.

VACANCY.—There is a VACANCY in the STAFF of the INDIAN COLLEGE, CALCUTTA.—An Application to be made to the Rev. VAUGHAN PHILLIPS, Gloucester, Gloucestershire.

TO SOLICITORS and Others.—An ARCHITECT and SURVEYOR, holding an Appointment which leaves him some leisure, desires further suitable EMPLOYMENT, such as the professional duties connected with a Building Enterprise, or the Management of a Town Estate, on reasonable Terms. Satisfying proofs of qualifications and references to competent works, public and private. Address, SURVEYOR, care of Warrington & Co., 23 Gresham Street, W.C.

WINTER SEASON in ALGIERS.—An ENGLISH PHYSICIAN, experienced in the climate, having taken a large Villa, with extensive grounds, in the lovely environs of Algiers, is prepared to receive a few ADIES and GENTLEMEN, to reside during the forthcoming WINTER. Every possible home comfort, with English comforts, (exceptional references given and required). Address, M. R. C. P., The Parsonage, St. Mary's, Tedbury, Devon.

MALVERN.—A PHYSICIAN of experience wishes to receive a RESIDENT PATIENT (nervous or otherwise). References exchanged.—For terms apply to Dr. COATES, Malvern.

BREWERY PUPIL.—There will shortly be a Vacancy for a Young Gentleman as PUPIL in an old-established Brewery of high repute.—Address, Y. Z., Mr. T. Watkins, Brewers' Engineer, 33 Gracechurch Street, London, E.C.

TO WINE MERCHANTS and Others.—A small PROPRIETARY CIGAR, at the West End of London, for SALE. Good returns. Long Lease.—For particulars, address C. C., care of Frederick May & Son, Advertising Agents, 10 Fleet Street, W.

FOR SALE, SUGAR ESTATE in QUEENSLAND.—The TYGUM PLANTATION, Logan River, is a fine property, being a portion of the Estate of Major JORDAN, Esq., late Agent-General for Queensland. It comprises 200 acres of good land, 60 being Scrub, and the bank of the river, besides 200 acres of excellent Pasture, with permanent water from two fine lagoons. Slats across only are at present under Cult, and 100 tons of Sugar were made last year. The Machinery and Steam-Engines, by the first makers, cost upwards of £2,000 three years ago, and are in perfect order. By enlarging the rollers, for which the rest of the works are adapted, the manufacturing power, which can now complete two tons per day, would be greatly increased. A considerable business may also be done in crushing cane for surrounding farmers, whose breadth of planting is increasing yearly. The Estate is situated in a very healthy locality, is prettily undulated, and a navigable river almost surrounds it. There is a stream weekly to Brisbane, and the main road to that city passes the property. There are a good Cottage, large six-stalled Stable, Labourers' Huts, and a Garden well stocked with Fruits, trees, vines, oranges, peaches, bananas, &c. Altogether it is a most eligible property, either for Residence or Investment, as the accounts show a handsome profit on the operations, although comparatively limited. Price £5,000.—For further particulars apply to T. M. MACKAY, 1 Leadenhall Street, E.C. N.B.—The Sugar from this Plantation took the Gold Medal at an Exhibition lately held in this Colony.

GRADUATES of Oxon, Camb., or Lond., and MEMBERS of the LIBERAL PROFESSIONS, residing in London or in any part of England and Wales, may obtain CASH ADVANCES of the Oxon and Berks Bank, Oxford. No banking account need be opened.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill.—Physician, Dr. EDWARD LANE, M.A., M.D., Edin. Turkish Baths, Consultations daily (Saturdays excepted) at 7 Prince Street, Hanover Square, from Ten till Twelve.

HYDROPATHY.—MALVERN.—Dr. RAYNER'S ESTABLISHMENT (formerly Dr. Wilson & Ryner). For prospectus apply to T. RAYNER, M.D., Malvern.

OVERLAND ROUTE.—The PENINSULAR and ORIENTAL STEAM NAVIGATION COMPANY BOOK PASSENGERS and receive Cargo and Parcels by their Steamers for

THE MINISTERIAL CHANGES.

THE Ministerial changes are probably complete for the present, although it may be conjectured that Mr. GLADSTONE intends hereafter to transfer the office of Chancellor of the Exchequer to Mr. CHILDFRS. The original appointment of Mr. LOWE was an act of generous self-denial. A Minister who has, like Lord MRSBOURNE or Lord JOHN RUSSELL, no special knowledge of finance, necessarily allows his Chancellor of the Exchequer the independent charge of his own department. Lord PALMERSTON in his two Administrations was fortunate in successively securing the services of Sir GEORGE LEWIS and Mr. GLADSTONE. Sir ROBERT PEEL, who was his own Finance Minister, found a loyal and useful coadjutor in Mr. GOLDSMITH, and it would have been advantageous to the Government and the country that Mr. GLADSTONE should have made a similar arrangement. Of all his colleagues Mr. LOWE might be expected to prove himself most impatient of interference or control; and it is not supposed that in the course of five years any deference has been paid to the greater knowledge and ability of the Prime Minister. By his first Budget, which covered a deficit by an ingenious anticipation of payments, Mr. LOWE acquired a reputation for originality; but the proposal and withdrawal of the tax on lucifer-matches, the attempt to remodel the succession duty, and the temporary increase of the Income-tax, indicated both barrenness of fiscal resource and a characteristic incapacity to appreciate public feeling and opinion. The second reduction of the duty on sugar was evidently an afterthought, for the revenue which was sacrificed had in the first instance been destined to the payment of the second moiety of the Alabama damages, and the contrast which was subsequently drawn between the poverty of sugar-consumers and the wealth of Income-tax payers was not calculated to inspire confidence or respect. It is perhaps scarcely desirable that Mr. GLADSTONE should discharge in person the duties of the Chancellor of the Exchequer; but many blunders would have been avoided if he had entrusted the office to a capable subordinate who would have been contented to obey the directions of his chief. Mr. DOBSON's industry and ability will enable him to relieve Mr. GLADSTONE of some of his labours, and it may be hoped that hereafter the Chancellor of the Exchequer will be on speaking terms with the Financial Secretary of the Treasury. Lord FREDERICK CAVENTISH probably deserves the confidence which is reposed in him by the Minister; but there is a certain absurdity in the periodical appointment of special Lords of the Treasury, who are, as it were, italicized or labelled for the purpose of calling attention to the extraordinary fact that they are competent to perform their duties.

It is useless to speculate on the probability of Mr. LOWE's success in the administration of the Home Office. He possesses vigour, activity, and familiarity with legal principles; and perhaps he may have learned by experience and disappointment the advantages of courtesy and good humour, and, above all, of a recognition of human nature. It is sometimes learned by experience, as when Lord ALBANY, after the overthrow in 1858, abandoned for the remainder of his life the tone of presumptuous insolence which had alienated friends and divided the House of Commons. The blunders which attend Mr. LOWE's great attainments and powers are manifestly due to his want of understanding of the human mind, and to his want of sympathy with the feelings of the people. It is not a pleasant thing to see the Prime Minister, who is not a pleasant man, in the

been thought to have lost the power of causing surprise, has falsified all reasonable expectation by subsiding into the modest post of Judge Advocate General. The office has by a characteristic job been revived for his benefit, after it had been suspended for two or three years as a sinecure. In this, as in several other instances, the most virtuous of Ministers allows himself to take liberties with the public service on the strength of his irreproachable character. It is perhaps to be regretted that the rumour which placed Mr. AYRTON at the Post Office proves to have been unfounded. In that department a firm hand and a despotic temper are at present urgently needed. Mr. MAXWELL has proved his pre-eminent fitness for relegation into private life by his weak submission to contemptuous superiors and to misfortunate assistants. In Mr. AYRTON's matronly Secretaries would have met their match. While botanists are no longer classed with market-gardeners, and while architects rejoice in their emancipation, discipline and regularity might have been re-established in the Post Office, if it had at last been provided with a responsible head. Mr. AYRTON's extreme unpopularity is not to be attributed exclusively to himself. Mr. GLADSTONE, with a powerful ingenuity, first placed him under Mr. LOWE, and when their relations at the Treasury became intolerable both to the CHANCELLOR of the EXCHEQUER and to the SECRETARY of the TREASURY, Mr. AYRTON was promoted to the office for which he was most notoriously and exceptionally unfit. The utilitarian concentration of purpose and the moral and æsthetic obtuseness which distinguished Mr. AYRTON as Minister of the Fine Arts would have been found useful in some other department; but the inactive pliancy which becomes a Judge Advocate General will not be congenial to a character as energetic as it is rough. Mr. ADAM, who has shown tact and discretion as Scotch Lord of the Treasury, would have been well received by the House of Commons as predecessor to Mr. GLEN. His administrative ability has not hitherto been tested; but as First Commissioner of Works he will certainly not give warrant offence.

It may be presumed that Mr. BRYCE accepts the Presidency of the Council as a dignified retirement, for Mr. FORSTER would scarcely consent to act as Assistant Minister of Education under a chief who claimed a practical right of interference. Some arrangement may perhaps be made with respect to the patronage of the office, which nominally belongs to the chief. It is evidently convenient that the real head of the office should appoint his own clerks and inspectors. It is indeed possible that some other office may be reserved for Mr. FORSTER, and that the PRESIDENT of the COUNCIL, who has formerly taken a warm interest in education, may in person perform some of the duties which slipped from the easy grasp of Lord RUSSELL. The brunt of Parliamentary contests is necessarily borne by the representatives of the department in the House of Commons. Mr. A. PEEL, who has had no opportunity of distinguishing himself as Secretary of the Board of Trade, will perhaps succeed as Parliamentary Secretary of the Treasury; but the qualifications which are required for the office can only be tested in practice. It will be Mr. PEEL's business not only to manage the party in the House of Commons, but to record for the information of the PUBLIC MIND the rise and fall of the political thermometer. There is nothing of knowledge in which Mr. GLADSTONE is more likely to be deficient, and probably he is not easily led or driven by his confidential Parliamentary adviser. At the beginning of the last Session Mr. GLEN, if he was in his place, could have told that it was impossible to pass any Irish University Bill, and that the special business of Mr. GLADSTONE's Government would, even if

they had been rightly estimated by the author of the Bill, have had no tendency to promote its success. It is highly probable that the SECRETARY of the TREASURY discharged his duty; but enthusiastic Ministers are not open to prosaic counsels. As the Government was destined to be readjusted, some other changes might have been advantageously adopted. Mr. CARDWELL, who has, perhaps without fault of his own, become unpopular with the army, would have been an excellent Chancellor of the Exchequer; and any modifications of his military schemes which might be thought expedient would have been more easily introduced by his successor than by himself. Other combinations within the Cabinet might be suggested; but, except for the necessary removal of Mr. LOWE from the Exchequer, the Government will have been neither strengthened nor weakened by the recent changes.

The return of Mr. BRIGHT to the Cabinet is no longer an event of primary importance. It was formerly thought advantageous to secure the alliance of a great orator who had been a formidable demagogue; and Mr. BRIGHT's adhesion involved the support or neutrality of many extreme Liberals. It soon appeared that Mr. BRIGHT had no faculty of administration; and it may be inferred from his recent denunciation of the Education Bill that he scarcely shared in the deliberations of the Cabinet. His compulsory retirement for two or three years from public life has diminished his influence; but possibly malcontent factions may be to some extent conciliated by his return to office. Since his recovery Mr. BRIGHT has only expressed his opinion by occasional letters, which have for the most part expressed approbation of proposed changes; but he lately declined to support an agitation for the establishment of a Republic. A few months ago, in answer to a complimentary address, he displayed the same narrow intolerance of opposition which had characterized his active career. As a member of a tottering Government he will connive without difficulty at the probable helplessness of his colleagues; yet it is not impossible that his resumption of office may indicate a change of policy in anticipation of the general election. If the Government meditates agitation against landowners, Mr. BRIGHT's presence in the Cabinet may perhaps convince the extreme party of the necessity of the movement. His antipathy to landlords, and his disapproval of the present system of the tenure of land, have been sincere and consistent; and although it is believed that Mr. BRIGHT has no zealous desire for further constitutional changes, he would undoubtedly support the extension of household suffrage to counties. As Mr. BRIGHT would in no case have exhibited administrative activity, it is well that he selects an office with little or no definite duty; but it is a curious and interesting circumstance that the fierce opponent of sinecures should in his later political life become Chancellor of the Duchy of Lancaster. One of his few functions will be the presentation to livings in the Establishment which he detests; but there is no reason to doubt that he will exercise his patronage fairly. In the course of six months some accident or change of opinion may possibly enable the Ministers to meet Parliament without imminent risk of disaster.

POSITION AND PROSPECTS OF THE GOVERNMENT.

THE general character of the transformation which the Government has undergone is now apparent. In different ways Mr. GLADSTONE's subordinates had got the Ministry into a mess. They were constantly blundering and quarrelling among themselves. They either did nothing or did too much. They were weak like Mr. BRUCE, or vexatious and impracticable like Mr. AYTON and Mr. LOWE. The consequence was that the Ministry as a whole lost day by day in reputation and power, and Mr. GLADSTONE found himself harassed and worn out in the discharge of the painful task of covering the faults and patching up the differences of his colleagues. He determined to put an end to this, and the main idea he seems to have had in view was to put the leaders of the party in front, and to throw the subordinates into the background, arranging their parts so that there should be as little opportunity as possible of their doing harm. He made himself Chancellor of the Exchequer, thus increasing the preminence of his position, and calling to his aid the prestige of his old financial reputation. He invited Mr. BRIGHT back to the Cabinet, not to do anything, but simply to show himself there as joint leader of the party. Thus the first part of his plan was carried out, and

the GLADSTONE Ministry is no doubt more the GLADSTONE Ministry than ever. Then he came to deal with his subordinates, and his first business was to punish those who had been the cause of mischief, but to punish them as lightly as possible, so that they might not be much wounded, while the indignation and alarm of the Liberal party might be mitigated. Mr. BRUCE has now for five years ruled the Home Office in a spirit of amiable weakness. It was well that the reproach of the party should be removed, and perhaps it was not thought a bad thing that the special enemy of the publicans should be got rid of before the elections came on. His removal was effected by the easy process of giving him a peerage, and of placing him in a post of honourable inutility. Mr. LOWE was selected to fill the vacancy, and he is too formidable and too really clever not to have received the best treatment that circumstances would permit. He has been made to leave the post which he held while making the astonishing series of blunders that have lately won him an unhappy notoriety; but he is transferred to an office of great importance, in which, as a strong man succeeding a weak one, he might hope to achieve success if opportunity were allowed him. A place which was tolerably honourable and lucrative had to be found for Mr. AYTON, and the bold step was taken of reviving the office of Judge Advocate General for his benefit. There is no mistake about the meaning of this. Two thousand pounds a year had to be found for Mr. AYTON if he was to be kept quiet, and the taxpayers were made to find the money by his appointment to what the Ministers themselves had justly described as an extravagant sinecure. It was a perfect job, but a weak Government cannot get on without jobbing; and at any rate there is nothing underhand about it. England is asked, and can afford to pay, 2,000*l.* a year extra in order to make Mr. GLADSTONE's life a little smoother. And then Mr. GLADSTONE is now doing Mr. LOWE's work for nothing, so that the country on the whole does not lose. Mr. GLADSTONE, in fact, carries the money and gives it to Mr. AYTON, on condition that he will for the present do neither good nor harm to any one. There is no great mischief in the arrangement, and there are so few people who in private life have not had to forego money or leisure in order to keep a disagreeable friend or relation quiet, that Mr. GLADSTONE is sure to have a large amount of secret sympathy bestowed on him.

Having put himself and Mr. BRIGHT in the front, and having administered a modest amount of punishment in a tolerably adroit manner, Mr. GLADSTONE had then only to fill up vacancies with new subordinates of decent character and attainments. There were plenty of good honest Liberals who were fairly qualified, and the only difficulty lay in knowing who could get elected again if his appointment made his seat vacant. Mr. GLADSTONE satisfied himself that he personally had not to undergo the ordeal of re-election. A lively discussion on the subject has been going on, and the arguments in favour of the necessity of a new election are exceedingly strong. It is, in any case, a curious fatality that Mr. GLADSTONE should have at last raised, in a question personal to himself, one of those subtle issues about the natural and non-natural interpretation of Acts of Parliament which gave rise to the COLLIER and the EVELINE controversies. Mr. BRIGHT has nothing, we presume, to fear at Birmingham, and he can take his own time about appealing to his electors, as he will not vacate his seat until he himself informs Mr. CHILDES that he is ready to take over the Chancellorship of the Duchy. It was fortunately discovered that Mr. DOUGLASS and Mr. GREVILLE could be appointed without their seats being vacated, and the only new official who has had to submit to a re-election is Lord FREDERICK CAVENDISH; and it was tolerably safe to reckon that his opponents would not embark on an expensive contest in order to give the title of M.P. to a Conservative who might very possibly never take his seat. But the promotion of Sir GEORGE JESSEL to the Mastership of the Rolls places Mr. GLADSTONE in some difficulty. The appointment itself was a matter of course after the ATTORNEY-GENERAL had prudently and honourably declined the office, and if the new MASTER of the Rolls fulfils the expectations of the Equity Bar, he will be a very good judge indeed. But to get a new Solicitor-General is by no means an easy task, for where is Mr. GLADSTONE to find a fit man willing to take the office and with a safe seat? If, for one reason or another, Mr. HARGREAVE and Mr. HENRY JAMES are to be passed over, there is no one whose appointment would not create some surprise. But it is obvious

that Mr. GLADSTONE will be greatly determined in his choice by the decision he has come, or feels himself coming, to as to the expediency of letting the present House reassemble. If there is to be a general election before Parliament meets, it will obviously be much easier to find a Solicitor-General, as it will not then much matter if he now has no seat, or if he loses his seat by not being returned after accepting office.

The question then is, whether the rearrangement of the Ministry has been made with a view to a general election at an early date, or with a view to carrying on business during another Session. We do not suppose that Mr. GLADSTONE has any very clear opinion on this head. He probably did the best he could under the circumstances, and is waiting to be guided by events before he decides when the dissolution shall be. But it may be confidently said that Mr. GLADSTONE's scheme of rearrangement is a good one for the purposes of an early dissolution, and a bad one for the purposes of carrying on business next year. His putting himself and Mr. BRIGHT into exclusive prominence, his administration of mild correction, and his choice of harmless and inoffensive subordinates, are all calculated to give as much spirit and confidence to the Liberal party in the constituencies as it is now possible to impart to it. The electors will be reminded more vividly than ever of the services which Mr. GLADSTONE and Mr. BRIGHT have rendered, and they can triumphantly reply to criticisms on Mr. Lowe's Budgets and contracts, that English finance is now in the hands of the first financier in the country. When taunted with the blunders of Mr. BRUCE, Mr. LOWE, and Mr. AYTON, they can retort that Mr. GLADSTONE has put an end to their eccentric manner of managing their departments, and that there is no good in kicking men when they are down. When driven hard by remarks on the numerous instances in which members of the Government have successfully done their utmost to make themselves disagreeable, they can confidently ask who are likely to be more industrious and amiable officials than Mr. DODSON, Mr. ADAMS, and Mr. GREVILLE. But for the purposes of carrying on public business during another Session the arrangement is evidently a bad one. Mr. GLADSTONE is exhausted by holding one office, and how can he possibly hold two, and retain strength and spirits? While, to get over the difficulty by making Mr. CHILDERS, or any one else, Chancellor of the Exchequer before Parliament meets, would be to throw away the strength gained by Mr. GLADSTONE's appeal to the memory of his financial reputation. Mr. GLADSTONE and Mr. BRIGHT again might easily manage to shape in harmony the general programme of their party, so far as it might be necessary that their addresses to constituents should unfold it; but there are questions on which they might come to something very near a misunderstanding, if opposition was once excited by the daily conflict over details which a new Session might bring with it. Nor are the new appointments such as to give the Ministry any accession of strength in the House of Commons. Mr. LOWE may easily govern the Home Office for a few months, in the dead season, but he will scarcely be content to hold his office when Parliament is sitting without taking up in an effective manner some of the many subjects which Mr. BRUCE has been so long considering; and Mr. GLADSTONE must have many misgivings as to what would be the consequence. The Bills might be very good Bills, but the Bills of a Home Secretary are always of a kind to touch some sets of people very closely, and the Government might easily find that it had made new enemies without having the credit of carrying its measures. The general result is, therefore, that the new arrangement of the Ministry will tend in a strong degree to make Mr. GLADSTONE incline to an early dissolution; but whether this tendency will prevail over other considerations, and especially over his natural pity for the host of his faithful supporters who will have to bid good-bye to Parliament when an election takes place, and over any vague hopes he may entertain of something turning up to retrieve the position of the Liberal party if he does but wait, is a question which probably the PREMIER could not answer, and certainly no one else can.

THE FUSION.

IF the reconciliation between the Count of CHAMBORD and the Count of PARIS has given unity to the monarchical party, it has at the same time greatly narrowed the monarchical future. Until now the Monarchy had, as to

speaking, two strings to its bow. It might be restored in the person of the Count of CHAMBORD, either by his accepting terms from the Assembly and consenting to become a Constitutional King, or by the yet greater miracle of the French nation accepting Legitimist principles, and breaking finally with 1789. In the event of a restoration being brought about in either of these ways, it was evident that either the King or the nation might come to regret the part it had played. HENRY V. might find constitutional restrictions too irksome, or the French people might find them too ineffectual. In either case, supposing Monarchy to have any real root in the country, there was, while the ORLEANISTS existed as a separate party and recognized a separate dynasty, a second chance open to it. The Count of PARIS might have played his grandfather's part over again, and have tried at all events to convince his countrymen that constitutional freedom was not incompatible with a modified type of hereditary rule. The meeting at Frohsdorf has destroyed this second chance. The Count of PARIS can hardly now supersede his cousin if he fails to maintain himself on the throne, any more than he can interfere with his placing himself on it. It is not merely that the head of the House of ORLEANS disclaims all present rivalry with the head of the elder branch; he must also be taken to have disclaimed all future and contingent rivalry. Consequently the whole hope of the Monarchy depends upon the Count of CHAMBORD. So long as he lives—and he is only fifty-three years old—it rests with him to say of what pattern the throne shall be. Unless he rewards his cousin's submission by an unexpected abdication, the Count of PARIS may for another quarter of a century have no greater influence in France than he has now. In estimating the more remote prospects of the Monarchy, this fact must not be left out of sight. A restoration means henceforth a Legitimist restoration and nothing else. There will be no second act in which the fortunes of the piece may be retrieved. The Count of PARIS is doubtless well advised in making this formal surrender of pretensions which, in his own person, he has never advanced. He must have weighed the chances of coming to the throne as his cousin's heir, and coming to the throne as the representative of the principles with which his family have hitherto been identified, and must have decided that the first alternative was the one which contained most elements of success. We do not question the wisdom of his decision; it is enough to point out that it gives us the real measure of Orleanist strength. It would appear that it is only by putting on the livery of HENRY V. that the Orleanists think they have any chance of getting to Court. As yet it is too soon for them to have realized how bitter a cup is reserved for them. They are now reaping the credit of having subordinated the interests of their family to the interests of the French nation. But if the ORLEANS family had been really necessary to France, there would have been no call for this sacrifice. The Fusion is an element of strength to the monarchical party only on the assumption that the Orleanists found themselves unable to stand alone. But if they are so powerless to contrive a restoration for themselves, what probability is there that they will be any stronger in guiding a restoration contrived by others? Yet upon their having some influence in this way hangs the hope of giving the restoration a constitutional turn. The Count of CHAMBORD is not likely to accept conditions from the Assembly of his own mere motion, nor to be urged to do so, by those of his followers who have always rejected constitutional restrictions as something unworthy of a true King. It was only the Orleanists who could have applied any pressure in this direction, and they have now shut themselves out from doing so. To apply pressure means that there is a penalty to be inflicted in the event of the pressure being resisted, and the reconciliation of the Count of PARIS to the Count of CHAMBORD involves the abandonment of the intention to hold any such penalty in reserve.

It must be admitted, however, that the Fusion, whatever it may do for the monarchical party hereafter, does give it a very large accession of strength in the present. The Royalists are now as much united as the Republicans. Both parties contain within themselves the seeds of future dissension, but both are agreed to let these seeds lie dormant until some more convenient season. In the Assembly the Royalists believe themselves to be so numerous that they can afford to throw the Republicans overboard, and it is quite possible that they will attempt, immediately upon

the return of the deputies to Versailles, to pledge the majority to some advance in the direction of a restoration. If the Republicans in the Chamber could trust only to themselves, they would probably be unable to offer any serious opposition to this step. But if M. THIERS assumes the formal leadership of the party—and in the present state of affairs there can be little doubt that, if he chooses, he may do so on his own terms—many of the more moderate Conservatives will be in sore straits which way to vote. They would be quite ready to welcome a Monarchy if a Monarchy could be trusted to hold its own. But its failure to do this under any of the forms in which it has been tried had disposed them a year ago to try M. THIERS's plan of a Conservative Republic. M. THIERS will not speak next Session with the weight which belonged to him as President, but his assurances that a Republic is the only Government for France will carry discomfort if they fail to carry conviction. So long as the experiment of another restoration remains untried, it will be an arrow left in the moderate Conservative quiver; whereas if it is tried, and found to fail, no choice will remain to them if they get tired of the Republic except a restoration of the Empire. When waverers of this class are added to the genuine supporters of the Republic, there will perhaps be a very large minority, if not an actual majority, in favour of keeping things as they are. It would be rash to set bounds to Royalist rashness under the influence of the hopes raised by the Fusion, but it is difficult to believe that a restoration would be seriously attempted if something like three hundred members of the most Conservative Assembly France is ever likely to see offered a strenuous opposition to the proposal. Some concession must be made to decency even by French Royalists, and the Assembly could hardly be called upon to pronounce upon a question of this importance with thirteen seats in it vacant. Yet thirteen elections in different parts of France, with the choice between a Monarchy and a Republic virtually submitted to the electors, would be like a general election on a small scale. As the attempt on the part of the Royalists to snatch a definitive decision on the form of government in the present Assembly would be tantamount to an admission that the constituencies are not to be trusted to return Royalist deputies, it is probable that the majority of these thirteen elections would return Republican members. There would be something especially desperate in a restoration undertaken in face of so significant a hint of the real hostility of the French people to a reproduction of the old Monarchy, in however modified a shape.

A telegram in the *Times* informs us that "one of the most influential men of the day" has just delivered himself to the following effect:—"We do not wish to patch up a Monarchy, we desire to establish it upon a solid basis. A few months are of no importance, either to the country or to the Count of CHAMBORED. Both will have time to reflect—France upon that which she owes to herself, and the Prince upon that which he owes to her." If there could be any certainty that this prudent resolution would be carried out, the restoration might be regarded as postponed *sine die*. There is no probability that, if France gets time to reflect, the result of her reflections will bring her any nearer the Count of CHAMBORED. But against this must be set the conviction, on which so much stress has lately been laid by the French Correspondent of the same paper—the conviction that the majority of Frenchmen will always be on the side of the Government for the time being. It is a great temptation to snatch at power when you know that the theft will be condoned as soon as it is clearly successful, and it is doubtful whether the French Royalists will be proof against this temptation. Yet if they had any real political insight, they would see that the circumstance which has given such apparent strength to every French Government in turn has in reality been the common weakness of all of them. A country in which popular support is always to be had by the actual holder of the executive power is a country which lies at the mercy of every adventurer who has courage and opportunity to seize the chief place in the State. If a stable Government is ever to be set up in France, it will be by its partisans being content to wait until they have ascertained what the true wishes of the nation are. Some preference must be felt by the great body of Frenchmen for one form of government over another, and if the Royalists genuinely wish to establish Monarchy on a solid

basis, they will put off a restoration until they have discovered that this latent preference really points in the direction they wish it to take. *

RAILWAY PROPERTY.

NEARLY all the Railway Companies have now declared their half-year's dividends; and the result is moderately satisfactory, though a great increase in traffic returns has scarcely sufficed to maintain former rates of profit. The most hopeless case is that of the Great Eastern Company, which, possessing a monopoly of three prosperous counties, has the misfortune of being principally confined to the transport of agricultural produce, and of local passengers and supplies. It is possible that when the nuisance of the Shoreditch terminus is abated by the opening of the new station in Broad Street, the passenger traffic may improve. For many years past the value of residential property in Essex and the nearer parts of Suffolk has been injuriously affected by the inconvenient arrangements of the railway, which has in its turn suffered by the stagnation of traffic. The line will never become profitable unless some new connexion gives it a share of the Northern coal trade. It has suffered in common with other Companies by the great advance in the cost of fuel and materials; and it possesses none of the elasticity which enables more fortunate systems to provide compensation for increased expenditure. Another railway which, like the Great Eastern, is fed neither by minerals nor by manufactured goods, contrives as usual to pay a respectable dividend. The principal Irish railway has for more than twenty years yielded to its shareholders a steadier return than any other line in the United Kingdom. Projectors who from time to time urge upon the Government or on Parliament the purchase of the Irish railways, say as little as possible of the Great Southern and Western Company, which has never indicated the smallest desire to part with its property. Notwithstanding the increase of working expenses, the dividend for the half-year is at the rate of five and a half per cent., which may be partly attributed to a moderate advance in passenger fares. The dividends of two of the great Scotch lines have not yet been announced, and the anticipations of shareholders and speculators are not at present sanguine. Hereafter the amicable arrangement between the Caledonian and the North British will perhaps benefit the proprietors of both Companies by enabling them to diminish the public accommodation without fear of competition. The Glasgow and South-Western Company for the present acts on the agreement which was formed with the Midland, as a measure preliminary to amalgamation. The strange rejection of the scheme by the Joint Committee may not improbably lead to the termination of the agreement. The half-year's dividend of the Glasgow and South-Western Company is reduced to the rate of four per cent., and the Midland shareholders will scarcely be willing to join the two capitals into one for the purpose of dividend.

The Southern lines which mainly depend on passenger traffic have on the whole maintained their former position; but the shareholders may reasonably be disappointed when they find that their income remains stationary during a season of unprecedented prosperity. But for the extraordinary rise in the price of coal and iron, the great railways which traverse Northern and Central England would have added two or three per cent. to their former rates of dividend. In present circumstances the Manchester, Sheffield, and Lincolnshire, the Lancashire and Yorkshire, and the Midland suffer a fractional decrease of dividend, while the London and North-Western, the North-Eastern, and the Great Northern cover the increase in working expenses by a large excess in gross profits. One-half of the small dividend of the Sheffield Company is compulsorily placed to a suspense account, because a shareholder has thought fit to file a Bill in Chancery on the eve of the long vacation, for the purpose of correcting an alleged misapplication of capital to revenue account. It is one of the numerous disadvantages of joint-stock property that any member of the partnership has the power of appeal to a Court of Equity with the result of injuring the other shareholders. In the present case the plaintiff may possibly have legitimate grounds of interference; but it sometimes happens that internal litigation is promoted for reasons which have nothing to do with the interests of the Company. In the

meantime the proprietors must console themselves with the hope that the assailant of the Company may only succeed in delaying for a few months the receipt of one-half of their income. As a general rule, Boards of Directors are quite as capable as the Court of Chancery of apportioning charges justly between capital and revenue. The prospects of Railway Companies can seldom be adequately appreciated without a special knowledge of details. The Sheffield Company has but lately obtained, in joint ownership with the Great Northern and the Midland, an imperfect access by the Cheshire lines to Liverpool. The joint station is still excluded from access to the Northern docks which accommodate the greater part of the foreign trade; but there is no doubt that within a few years the associated Companies will compete for the Liverpool trade on equal terms with the London and North-Western and the Lancashire and Yorkshire. At the half-yearly meeting the Chairman of the Sheffield Company announced the expectation of a probable trade of a million tons of iron annually from Bilbao to Grimsby for the use of the manufacturers of Sheffield. He also stated that all the repairs of the line are now made with steel rails, which cost perhaps three times as much as iron rails, and wear six or eight times as long. In an accurate estimate of the future net returns of any railway, it would be necessary to include a calculation of the probable cost of repairs, as well as of actual and probable sources of traffic.

The Midland Company, though it has been compelled to apply the great increase in its gross receipts to the payment of additional working expenses, would probably have been able to maintain the dividend of last year but for a conversion, under the provisions of a special Act, of some of its preference capital into ordinary stock. No Company has better grounds for anticipating an increase of future revenue. The large capital which is invested in a third part of the Cheshire lines is only beginning to produce a return, and the interest of two millions expended on the construction of the line from Settle to Carlisle is now paid out of the receipts of the existing system, although a year and a half will elapse before the extension is completed. The Company will undoubtedly establish a profitable trade with Liverpool; and, on the opening of the Carlisle line, it will, for the first time, practically compete with the London and North-Western for the enormous traffic which is exchanged between Scotland and England by the West Coast route. The Midland line from London to Carlisle will be equally good with the competing line of the London and North-Western; and from the Midland districts it will have the advantage in distance. In conjunction with the Glasgow and South-Western, the Midland Company will carry a part of the traffic from Glasgow to Liverpool and Manchester, though the mode of connexion still admits of improvement. The whole of the net revenue which must arise from participation in the Scotch traffic will be immediately added to the dividend. The North-Eastern Company still retains exclusive possession of Northumbria from the Humber to the Tweed, but it has been forced, as the price of reserving one portion of its monopoly, to purchase the alliance of the Manchester and Sheffield Company for a payment which may perhaps amount to some thousands in the year. The town of Hull, writhing even more restlessly than the other subject districts under the despotism of the North-Eastern, projected a line which, by a connexion with the Sheffield lines south of the Humber, would have given Hull a competitive route to the Midland districts and to the West Riding. The Sheffield Company, after maintaining for a time a judicious neutrality between the North-Eastern and the new Company, ultimately throw their weight into the scale of opposition, on condition of obtaining running powers into Hull, which have probably by this time been commuted into a money payment. A Committee of the House of Lords, by an unusual miscarriage, fell into the error of rejecting the independent line, which must necessarily have passed if it had been supported by the Manchester, Sheffield, and Lincolnshire.

The London and North-Western and the Lancashire and Yorkshire continue to work on the terms which would have been rendered compulsory and perpetual if the amalgamation had been granted. In this instance the decision of the Joint Committee was as sound as it seems to have been erroneous in the case of the Midland and Glasgow and South-Western. The voluntary alliance may be maintained for a time, but it contains within itself the seeds of dissolution. By one of the conditions, the Lancashire and

Yorkshire dividend is to exceed the London and North-Western dividend by 12s. 6d. per cent., although it is perfectly clear that the payment of the bonus could not be sustained against the objection of a single London and North-Western shareholder. The same result may be indirectly produced by arrangements between the general managers for the direction of traffic along the alternative lines of the two allied Companies; but, although such an adjustment of earnings and profits would be complicated and difficult to understand or expose, the directors of either Company might be restrained by a Court of Equity from diverting traffic from their own respective systems for the purpose of fulfilling the terms of their bargain with their allies. The agreement between the two Companies is opposed to the public interests; and it is on the whole desirable that one or both bodies of shareholders should cease to acquiesce in a division of profits which can scarcely coincide at all times with the actual returns of both systems. The most consolatory result of the railway experience of the half-year consists in the advance of the gross receipts of nearly all the Companies. The exceptional price of coal and iron may probably be maintained; but there is little reason to fear that it will again expand. The railway traffic, on the other hand, has, with some occasional interruptions, become for many years larger and larger. In nine years it has increased by sixty per cent., and if the same rate of advance is maintained for nine years more, the dividends will perhaps not again be kept down by a new increase in working expenses.

ROME AND ITS ADVERSARIES.

FAR above all small questions of current politics, changes of Ministries, substitution of Republics for Monarchies, or Monarchies for Republics, stand the two great questions of the times in which we live—the question as to what will be the issue of the contest between the labouring classes and their employers, and the question as to what will be the issue of the contest between the Church of Rome and its adversaries. The two questions are even beginning to interlace on the Continent, and those who dread the working-man denounce him as the enemy of religion as well as the enemy of property and comfort. In England the distrust of the labourer and the weariness and disgust produced in the minds of quiet people by perpetual strikes show themselves in the comparatively mild form of an alienation of wavering Liberals from their party, and an inclination to see whether a Conservative Government cannot impart a more healthy tone to society. But on the Continent, and especially in France, there is a very large and active party which proclaims as loudly and persistently as it can that the only way to get the labourer into a right frame of mind again as regards his work and wages is to submit him once more to the old authority of a despotic religion. The pre-eminent thought in minds of this type is that half measures, half religions, and half governments have failed. They have encouraged an amount of liberty with which they have not been able to cope after it has once attained its full force. They have made men discontented, disorderly, and unhappy, and if mankind is ever to be happy again, it must return to the paths it has deserted. There is nothing new in this, as there have always been in every age crowds of people who have thought that the only reason why governments ever failed was that they did not govern enough, and that religious authorities should seize hold of every man from his cradle to his grave, and, with the aid of the civil authorities working submissively under them, should take care that he did not come to harm, or bring others to harm in this world or the next. What is new, at least in this generation, is the determined and thorough manner in which this view of human life is now asserted in the face of the violent opposition it excites. In every direction the Absolutist party takes the ground of rejecting every compromise, and of carrying out its theories without heeding any of the limits which common sense or the strength of counter-theories might impose. In politics it is engaged in a fierce combat, beating down Republicans, sneering at Constitutionalists, spreading the peace of silence wherever it can reach. In religion it is loth to trouble itself with evidences, modest misgivings, limited adoration. It is determined to have miracles and visions, and it has them. It delights in every form of mysticism and pietistic rapture. It sees in every event of life a judgment or a blessing ac-

corling to its prepossessions. And then all this fervour and this distaste for half measures constantly find force and support in the dogma of infallibility which has so largely changed the attitude of the Church to the Civil Power. One month now pronounces absolutely and unquestionably what is right; and all bargains with the Civil Power—concordats, vetoes on bishops, and other devices by which the State kept the Church somewhat in the background—now seem out of date. The Pope alone is to speak, and kings, and emperors, and presidents have but to listen.

The consequences of this new attitude of the Absolutist or Ultramontane party are rapidly making themselves felt all over the world. It was because the Irish bishops would have all or nothing that the very liberal offer made on the part of the State by Mr. GLADSTONE to the Irish Catholics was rejected, and the problem of Irish Education was deferred to a remote future. In Germany the collision between Church and State grows every day more intense. There the State is a great power, and its means of annoying a religious body which defies it are very considerable. On neither side is there any flinching. The Government has armed itself with new laws, and is resolutely putting them in force, and it has taken under its protection that small body of Catholics which openly stands aloof from the bulk of the community to which it lately belonged, and rejects the dogma of infallibility. The legislation of the summer has enabled the Prussian authorities to inspect and decide on the merits of every clerical institution, and Commissioners are at work who do their duty without any hesitation, and insist on the secrets of every institution being revealed to them. If they report against an institution and their report is approved of, the institution is at once closed. Schoolmasters are warned that they must not belong to those Catholic associations which are pronounced to be dangerous, or they will forthwith be dismissed. The Archbishop of POLEN has been sentenced to a heavy fine for contravention of the new laws, and the State authorities have given notice in a town where an incumbent was appointed by an Archbishop in a manner not permitted by the law, that the State will not recognize any of the acts performed by this ecclesiastic, and, more especially, that marriages celebrated by him will be considered invalid, and that children baptized by him will need to be rebaptized. The Courts have also intervened to help the Government. They have decided that the Old Catholics are not Dissenters, and that they are a religious body recognized by the law, so that attacks on their worship by their Ultramontane enemies may be punished as libellous. The Government, adopting this view, and carrying it out to its natural conclusion, has not only refused to interfere with the Old Catholics, but has appointed an Old Catholic to be an inspector of schools in a district where a large portion of the schools he will have to inspect belong to Catholics. The Ultramontanes pay as little attention as they possibly can to the decrees of the State, will not come when they are sent for, or do as they are bid, and keep doing what they are forbidden to do by law. That they will be in some degree strengthened by the severe measures taken to coerce them, that their ardour will grow more intense, that their secret associations will become more powerful, and that they will gain in coherence and organization, is tolerably certain. But whether the State may not in the long run and on the whole beat them, and make the mass of Germans hold aloof from them, is still uncertain. The Government has on its side the idea of the State and of its authority which is now so deeply planted in the German mind. It has also the national spirit, which sees in German Ultramontanes the friends of France and the enemies of the Fatherland. But perhaps what will tell for the Government more than anything is that it daily becomes clearer from the experience of other countries that a nation must, since the promulgation of the dogma of infallibility, either quarrel with Ultramontanism or bow to it. Germans might get tired of a purely German contest, but when they look beyond Germany they will see that what is happening to them is happening to a great many other people also, and that they must in some shape or other take their share in a struggle that is almost universal.

If there was one place more than another where it might have been supposed that Ultramontanism would find none of that moderate resistance which consists not in breaking away from religion, but in attempting to set bounds to ecclesiastical power, it was South America. But even there the quarrel which is distracting Germany has begun to

rage. The State in Brazil finds itself defied by the Church, and the State in Brazil is tolerably strong, and respects itself, and does not feel disposed to do exactly what it is told to do by ecclesiastics of the modern type. The bishops in Brazil have ventured on two measures which have placed them in antagonism with the Government. They have introduced, without the permission of the Government, which is legally necessary for the purpose, Papal decrees, and put them in force, and they have taken upon themselves to excommunicate Freemasons, and to refuse them the rites of the Church. It may be added that very recently a new set of bishops, foreigners and violent Ultramontanes, have been imposed on the country by Rome, while the local clergy has still some feelings of independence remaining. Thus exactly the same questions which have arisen in Germany are arising in Brazil. The three main offences of the Prussian bishops in the eyes of the Government were that they set up the law as promulgated by the Pope above the law of the State, that they abused the power of excommunication, and that they were parties to a system by which Catholic Germany was flooded with importations of foreign ecclesiastics. To make the bishops and their inferiors obey the State laws, to keep their power of excommunication within the narrowest possible limits, and to drive foreign ecclesiastics out of the country, were the aims which those who framed the new Prussian ecclesiastical legislation had constantly in view. Whether the State, if pushed to extremities in Brazil, will adopt measures of equal vigour, it is as yet too early to say; but at present the Emperor and his advisers appear determined not to shrink, and they are said to be effectually supported by popular opinion. In Europe the contest is perpetually assuming a political form which in some degree conceals its true character. It has a tendency to merge itself in the general quarrel between France and Germany. The Swiss Government has been among the foremost to withstand the new ecclesiastical onslaught, and it is said that the Ultramontane party in Switzerland has recently applied for aid to the new French Government; while the Italian Government has given a public intimation of its conviction that the new-born fervour of French officials for pilgrimages and expiatory churches and clerical intrusion into the army constitute a menace to Italy which it would be folly to disregard. But with regard to Brazil, there is no political question of the kind. If there is to be a war of revenge, Brazil can help neither party, and it is therefore in the highest degree instructive to find that there too the new dogma is producing a crisis essentially the same as that through which Germany and Switzerland and Italy are passing.

MR. BRIGHT AND THE EDUCATION QUESTION.

MR. MUNDELLA has lately comforted his constituents by the assurance that "whatever might be said about the Education Act and the 25th Clause, he was very much mistaken if JOHN BRIGHT had joined the Cabinet for "nothing." This rather indefinite assurance may be taken as expressing a not uncommon view of the meaning of Mr. BRIGHT's return to office. So far as this view is capable of being reduced to definite shape, we believe that it is altogether incorrect. It may be conceded to Mr. MUNDELLA that Mr. BRIGHT has not joined the Cabinet for nothing, but we are very much mistaken if the object he is supposed to have in view is a change in the educational policy of the Government. The improbability of this theory may be shown in several ways. In the first place, it is contradicted by the facts of the recent reconstruction of the Cabinet. If the Government had made a compact with Mr. BRIGHT that the 25th Clause of the Education Act should be repealed, they would certainly have wished to move Mr. FORSTER from the Education Department. As an isolated change this would have seemed too much like a capitulation; but when the whole Cabinet was playing at puss in the corner, there was an opportunity of effecting it without any open confession of defeat. Mr. FORSTER has well earned promotion to a higher place in the Ministry, and there is scarcely any department which would not have been strengthened by his being placed at its head. It is inconceivable that such an occasion should have been passed over if the Government have any intention of conciliating the Dissenters any further. Mr. FORSTER has so lately identified himself with the policy of the 25th Clause, so lately declared his conviction that the application of compulsion on a large scale would be impossible without such a clause, that it would hardly be pleasant for him to

remain a member of the Cabinet which undertook to reverse that policy. Still less would it be possible for him to remain the real chief of the department which would have to carry out that reversal. And when to this is added the fact that in the natural course of things his removal from his present office would have formed one of the late changes, the conclusion is irresistible. The Government are not going to repeal the 25th Clause of the Education Act, and Mr. FORSTER has remained Vice-President of the Council in order that no loophole should be left for any suspicion that the clause is to be repealed. His continuing to hold this particular office, when he would naturally have left it, can be explained on no other hypothesis. It was no doubt foreseen that Mr. BRIGHT's return would be interpreted in the way in which Mr. MUNDELL has chosen to interpret it; and lest any countenance should be given to such a theory, Mr. FORSTER, who would otherwise have been one of the first Ministers to move, has been in no way affected by the reconstruction.

The same conclusion may be reached by considering Mr. BRIGHT's speech to the Nonconformist delegates some weeks back. He had heard many denunciations of the educational policy of the Government, and had himself denounced the Act of 1870 as one of the worst measures ever passed by a Liberal Government. Yet the whole drift of his speech was to urge the Dissenters not to break up the Liberal party upon this question. Mr. BRIGHT has never been given to preaching forbearance upon matters which he holds to be of essential importance; and we may be sure that when he tells the Dissenters that the maintenance of the 25th Clause does not justify them in seceding from the Liberal party, he means that the clause, though it is not one which he would himself have drawn, may still be accepted without any compromise of principle. Now it is highly improbable that Mr. BRIGHT would have made any stipulations before re-entering the Cabinet, except upon matters involving a principle. He comes back to the GLADSTONE Ministry at a time when men of less generous temper would have been inclined to run away from it, and he must know perfectly well that to come back, insisting upon a radical change of policy in educational matters, would be to make his return a source of embarrassment rather than of strength. That he hopes to convince some at least of his Nonconformist allies that the gulf between them and the Government is not so wide as they think, is likely enough. But Mr. BRIGHT has too just an appreciation of Englishmen to be likely to mistake the noisy manifestations of the Education League for a genuine expression of public opinion. He knows what opinion the English ratepayer would entertain of a policy which saddled him with any large additional burden. It has always been a striking merit of his speeches on taxation that he has realized with wonderful vividness of imagination what even a small additional payment really means to very poor men. The Birmingham League are wholly unable to take this in. They talk as glibly as you please about the ratepayer's conscience; but they never seem to consider that the ratepayer has a pocket as well as a conscience, and that the pocket is usually a great deal the more tender of the two. Mr. BRIGHT knows this, and consequently he knows that to carry out the policy of the Education League would be to give the cause of education a backward impulse which it might take many years to recover from. If Mr. BRIGHT does not think the 25th Clause of enough importance to justify secession from the Liberal party, still less will he think it of enough importance to justify the infliction of an injury of this magnitude on the cause of national education. The disruption of the Liberal party would be a political mischance of some gravity; but it would be as nothing compared with the misfortune of a real failure of the attempt to make education universal. If Mr. BRIGHT is not ready to encounter even the former risk, *a fortiori* he will not be willing to encounter the latter.

In the third place, great as the power of Mr. BRIGHT's name still is, his support would not have been worth buying if he had put upon it such a price as some of his friends seem to suppose. The elections for East Staffordshire and for the North-West Riding put this fact beyond dispute. It is not denied that Mr. JAFFRAY was beaten because the moderate Liberals would not vote for a candidate imposed upon them by the Birmingham League. It is not denied that Lord FREDERICK GAVENDISH is to be allowed an unopposed return because, after Mr. FORSTER's recent speeches, the moderate Liberals who voted for Mr. POWELL in preference to Mr. HOLDEN would probably return to their former

allegiance. We believe that the general election will show the same causes everywhere at work. The Dissenters are fond of picturing the tremendous catastrophe which must befall the Liberal party if they make up their minds to desert it rather than abandon their present claims. That the disruption caused by a Nonconformist secession would be a serious need not be denied, but it would be as nothing to the disruption which would happen if the Government were to concede the Dissenters' claims. The moderate Liberals would be disgusted on all grounds. They would bitterly resent the dictation exercised by a minority of the party. They would despise the Government for its weakness in allowing itself to be dictated to. They would feel that they had far more real sympathy with moderate Conservatives than with extreme Liberals. They would hold that the right of the majority of the community to give their children a religious education, provided that the children of the minority are in no way damaged by it, is a right of greater importance than any which the Liberal party now has to fight for. The result of all this would be to send them straight into the arms of the Conservatives, and to reduce the great Liberal party, built up with so much pains, and kept together with so much difficulty, to the dimensions of a small Radical sect. These would be the influences working on intelligent Liberals of the moderate sort, and they would be strongly reinforced by influences of a lower order. Supposing that the Government were to repeal the 25th Clause, it would be impossible for them to stop short, not only of universal School Boards, but of universal School Board schools. Thousands of parishes where the inhabitants have been content for years past to see the school kept up at the cost of the rector and the squire, supplemented by school fees and an unnoticed grant "from moneys voted by Parliament," would suddenly be called upon to elect a School Board, to build new schools, and, as a necessary accompaniment of these measures, to levy a school rate. Hitherto these people have regarded education with indifference perhaps, but not with dislike, and when they have heard the Education Act mentioned as one of the great measures with which the Liberal party is identified, they have accepted it as something which, if it did them no obvious good, at least did them no appreciable harm. As soon as the Education Act came to be identified with a large and needless addition to local burdens, this indifference would be changed into active and bitter hostility. The Conservatives would sweep the rural constituencies because they were opposed to the increase of rates, just as they would sweep a majority of the town constituencies because they were opposed to secularist tyranny. This is hardly a consummation which Mr. BRIGHT will care to promote.

SPAIN.

SEÑOR CASTELAR is a great orator, perhaps the greatest in Europe; but it is strange that he should still have the heart to make fine speeches. The majority of the Assembly which he addresses requires no protest against rebellious anarchy; and the accomplices of insurrection who still retain their seats in the Cortes are beyond the reach of persuasion. In one of his late orations CASTELAR contrasted the eminent civilians of the Republic and the Monarchy with the obscure military adventurers who are seizing towns and fortresses in defiance of the shadowy authority which still claims to represent the State. It is impossible to exaggerate the baseness of such rebels as CONTRERAS; but they owe their opportunity of plunder and secession to the restless patriots who precipitated Spain into an unknown future. It is now clear that the overthrow of ISABELLA, notwithstanding the scandals of her reign, was a grave political mistake; but PRIM and SERRANO and their associates had some excuse for thinking that the Monarchy which guaranteed social order might be preserved, although the occupant of the throne was changed. FIGUERAS and PI Y MARGALL, who have already proved their incompetence to govern, combined with CASTELAR in their successful attempt to proclaim the Federal Republic. Their habitual assumption that their faction owed no allegiance to the established Government is now turned against them by more extreme and more reckless opponents. If every man has a right to repudiate any authority which he dislikes, it might be difficult to prove that CONTRERAS and CARCELES are worse than the Republican orators in the time of the Monarchy. CASTELAR lately informed the Cortes that Re-

publicans have too much of prophecy and too little of politics; and a long list of precedents strung together after the manner of MACAULAY illustrated the barren proposition. From MOSES and JOSHUA down to GAMBETTA and THIERS it appears that the discoverer always makes way for the leader who is permitted to enter the promised land. On the same theory it might be contended that CONTRERAS was the legitimate successor of CASTELAR; but, diverging from the natural course of his argument, the orator proceeded to deliver a florid eulogy on himself. His name, he asserts, is dear to Europe, and dear to America, and it will be indissolubly associated with the Republic. He cherishes the sentiment of unity which is, it seems, characteristic of a nation which has been invited by CASTELAR himself to disintegrate itself into a Federal Republic. The rebels, instead of echoing his figures of speech, have taken the Federalists at their word, and they may perhaps recognize some kind of federal bond among the petty Republics or tyrannies which they are establishing in various parts of the country. It is wonderful that a belief in the efficacy of grand sentiments and fine phrases should survive the experience of the last three months.

The present Minister is either more honest than his immediate predecessors, or he has learned wisdom from their disgraceful failure. For some time past there has been no parleying with rebels, and Seville and Valencia have been reconquered. It would seem that the insurgent leaders are as incapable as the Government from which they have revolted of commanding the obedience of their followers. The mutineers of the regular army have risen, not against the national flag, but for the purpose of claiming an exemption from the duty of fighting. Any officer in the service of the Government who can induce two or three regiments to follow him easily overpowers resistance; and the armed rabble of Volunteers readily join the ranks of the party which seems at the moment likely to be victorious. On the whole, the prospects of the State have improved within two or three weeks through the weakness and disorganization of the insurgents. CONTRERAS has been defeated in the field, and it is hoped that he may soon be taken prisoner; but Carthage still holds out, and fresh insurrections break out from time to time in unexpected places. The garrison of Barcelona is constantly threatening open mutiny; and probably the town might already have proclaimed its independence but for the vicinity of the Carlist bands. It is remarkable that, notwithstanding the dissolution of civil and military obedience, the Royalists make no visible progress. With twenty thousand men DON CARLOS might march unresisted to Madrid; but his lieutenants are unable to collect any considerable force; and probably they are aware that beyond the provinces which they at present occupy they are absolutely without a party to support them. Even the clerical influence is not wholly on their side. Queen ISABELLA was as devout as she was indifferent to moral considerations; and only a year or two before her fall she received from the Pope the gift of the golden rose which was reserved for saintly princesses who have deserved well of the Holy See. On the eve of the revolution of 1868 her Government had determined to occupy Rome in the place of the French garrison which the EMPEROR required for his meditated attack on Prussia. According to CASTELAR, the reign of DON CARLOS would revive the horrors of TIBERIUS and NERO; and it would be better that Spain should be plunged into the depths of the sea than that the legitimate Pretender should establish himself at Madrid. It is perhaps more to the purpose to remark that a faction which has been unable to profit by the existing anarchy will never be strong enough to command general obedience.

The curious question of international law which was raised by the resolute proceedings of a German naval officer appears for the present to be left in abeyance. Captain WERNER acted without instructions from his Government, and his vigorous measures have not been subsequently approved. It may be conjectured that Prince BISMARCK's hesitation proceeds rather from indisposition to recognize the Madrid Government than from excessive delicacy in dealing with insurgents. CONTRERAS, as a rebel, would find little sympathy at Berlin; but, as a bigamist is sometimes acquitted because his first marriage is proved to have been invalid, rebellion presupposes a legitimate authority, which has not yet been recognized as appertaining to the Republican Government of Spain. The Ministers, with questionable patriotism, requested all foreign Powers to treat the crews of the revolted ships as pirates, but, in

the estimation of the German CHANCELLOR, SALMERON himself may perhaps be a rebel. The English Government, reflecting perhaps on the miscarriages which occurred during the American Civil War, abstained from affording protection to its subjects at Carthage at the time when it was most urgently needed. It was not perhaps thought expedient either to capture CONTRERAS's squadron, or to allow it belligerent rights at the cost of offending the dominant party at Madrid. It was to avoid similar difficulties that the QUEEN's proclamation was issued in 1861; and notwithstanding the remonstrances and invectives of the Federal Government, it is right that in all cases of civil war the commanders of English cruisers should be furnished with definite instructions. As a general rule, it may be assumed that any usurping Government which can send a squadron to sea is sufficiently regular to relieve the officers and crews from liability to the charge of piracy. Although their own Government may afterwards think fit to punish them as traitors, foreign Powers are not bound to inquire into the merits of rebels, or, in other words, into their chances of success. The rigid neutrality of England in the American Civil War led to much unfounded abuse, and ultimately, through the timidity of the English Government, to discredit and loss; but no alternative course of policy would have been either more prudent or equally justifiable. It is not at present likely that any part of Spain will be able to effect a permanent secession; but a Government which is for the time unable to protect foreigners in any part of its dominions has no right to complain of a provisional recognition of the authorities which may happen to exercise local sovereignty.

The eulogists of the Spanish Republic who have lately been reduced to perform the humbler function of apologists busy themselves in proving that political communities, and Spain in particular, may continue to exist, and almost to thrive, in the absence of government. It is true that in low organizations vitality is too widely diffused to be readily exposed to a mortal blow. It is credible that in many parts of Spain men may pursue their ordinary course of business and pleasure, although empty declaimers exercise precarious authority at the capital, while the army and navy dissolve themselves by successive mutinies, and the nation is split up into accidental fragments. A degraded population may be insensible to national honour and indifferent to public safety as long as its own convenience is not immediately affected. It is idle for those who sympathize with Republics and revolutions to boast that there was no robbery in Carthage at the moment when the respectable portion of the inhabitants, knowing well the character of the insurgent populace, were flying from the town in thousands. Indiscriminate massacre and plunder never follow immediately on a political revolution. The admirers of the Carthage rebels are the same who applauded the establishment of the Federal Republic at Madrid because it had not produced within twenty-four hours the anarchy which has since been its natural result. It is said that when an angry mastiff breaks its chain, surprise and fright check for the moment the indulgence of its ferocious propensities. A rabble which has suddenly become independent and supreme is for the time unconsciously restrained by inexperience and by former habit. It seems that for some hours after the revolt the shops of Carthage were frequented by customers; but business has since subsided as the solvent inhabitants have withdrawn; and inevitable distress will not fail to excite the rapacity of the mob. At present the only hope of Spain is a reaction of loyalty in the army, and of regard for order among the general population. If the present Ministers or their successors reconquer the seceding districts, they will be superseded by the successful commanders, who in their turn will probably make terms with one of the monarchical parties. If the dissolution of military obedience proceeds still further, the Republic may for a time nominally survive, but civil and political society may perhaps almost cease to exist.

HONOURS AND REWARDS IN THE BRITISH ARMY.

THE *Times* did a good service when it took the opportunity of our Ashantee alarm to call attention to a subject on which there has been too much reticence in the press—the peculiar distribution of military employment and rewards which has been hitherto the rule in our army. Our contemporary's complaints of what to civilians must needs

seem to be a scandal have been loudly echoed; and the main facts alleged have nowhere been questioned, yet they appear so strange as to call for special explanation. In attempting to give this explanation we shall charge no one individual with the responsibility due to an antiquated and evil system. The convenient impersonality conveyed in the mysterious words "the Horse Guards" may well serve our turn, as it does that of the military journals; though some one in the last resort must evidently be responsible for those omissions to give proved merit its due weight of which the nation has a right to complain.

Few persons, we suppose, will deny the proposition that the fittest reward for a successful soldier, whilst still able to bear arms, is to give him that higher military employment for which his services and talents have marked him out. And lest any one should doubt what is the duty of the authorities in this matter, we may refer to a striking passage in the Queen's Regulations which lays down that "it is essential to the good of Her Majesty's Service that the Commander-in-Chief should be made thoroughly acquainted with the actual state of every corps . . . and that he should have, as far as possible, a personal knowledge of the merits and capacity of officers, and more especially of those in command of corps, of all arms, with a view to their being selected on future occasions for situations of greater responsibility." Nothing could be more admirable than the spirit of this paragraph; and, though applied in the first instance to ordinary peace inspections, its spirit plainly bears more forcibly still on those higher services or specially heroic deeds which from time to time illumine the annals of our army. There is no pretence here that the high authority named should be bound in his selection by a conventional belief in the superiority of any one arm for command, or worse, by the traditional claims of any particular branch to an invidious preference. The best place to the best man, and the good of the service above all—that is the only rule admitted.

But is this the spirit in which selection is really made? Are these the principles on which our staff has hitherto been chosen? Alas for fine sounding words and well-drawn regulations when they conflict with long-standing privileges and secret personal influence! In reality the word "officers of all arms" have hitherto been interpreted so as practically to exclude the scientific corps. If the good of the service and the advantage of the country which maintains it had been really studied, should we have heard, for example, at the first hint of a crisis in the chequered history of our colonies, of the deliberate neglect of one of our most promising soldiers? For, taking him all in all, viewing his past services, his character, and the youth which to a commander in the field is so invaluable, we have no hesitation in expressing our conviction that, if the real pinch came, either at home or abroad, there is scarcely a name on our Army List from which the country would have more to hope than from Colonel GORDON, ex-General-in-Chief of "the Ever-victorious Army."

Reference has already been made to Colonel GORDON's case, and we could not have a better one to illustrate our meaning. Those who have studied the history of his overthrow of the Taepings appear never to be weary of speaking of the genius with which he carried out his undertaking. When GORDON was first placed in command of a small force raised locally to protect the environs of Shanghai, the fierce pretender known as "The Heavenly King" had devastated the country to within sight of that great mart, subdued all the neighbouring provinces, and apparently consolidated his power firmly in them. Repeated defeats by his hordes of the Imperial troops had broken the spirit of the latter and apparently the established superiority of the Taeping leaders. Worse than this, the demoralized feeling of the mercantile community at Shanghai, who were anxious at any cost to regain their lost trade, inclined them to intrigue against the Mandarin Government, now no longer able to assert its authority; whilst the missionaries, misled by the jabber of a few New Testament phrases picked up in their schools, were teaching Exeter Hall that the bloodstained impostor of Nanking was a Christian at heart, who only needed a little help to get rid of heathenism and CONFUCIUS. All things at the moment seemed favourable to the prevalence and extension of an empire built on conquests more ruthless than the worst Tartar invasions of the middle ages, and of doctrines more degrading than those which MOORS dreamed of when he wrote of the Veiled Prophet of Khorassan. Such was the situation in Western

China at the time of GORDON's appointment. When the Foreign Office, misled by the fanatical friends of the Taepings, stayed his hand in the following year, his work was already done. City after city had been recaptured. Masses of armed men twentyfold the number of his force had been outmanœuvred and dispersed, or forced to lay down their arms. The Imperial forces had retaken the field with fresh confidence. And "The Heavenly King," shut into his last stronghold and deserted by his followers, was about to destroy himself in order to escape the lingering death to which, in his days of power, he had been wont to doom his victims. Never was success more brilliant or complete. And the success was fully matched by the readiness with which the commander of "the Ever-victorious Army" laid down his arms at the first beck of home authority, and by the modesty and self-denial with which he shrank from the rewards pressed on him by the gratitude of Peking. A man who had wrought such wonders with means so modest as a levy of Coolies officered by the refugees of our China trade needed, we may be sure, only to be put to the highest tests to show how just those were who had marked him out in his Crimean days as a youth whose extraordinary genius for war could not be surpassed in the army that lay before Sebastopol.

It can hardly have been an accident that left GORDON henceforth unemployed and unnoticed save by the step of brevet rank such as is the usual reward of ordinary war service. That successes are viewed by our authorities not so much according to the merits as according to the uniform of him who wins them, has been forcibly shown by the contrast between this case and that of the Red River Expedition, and the rewards heaped on Colonel WOLSELEY for his conduct. Richly did that gallant young soldier deserve the honours conferred upon him, although to compare his operations with the marvellous campaign round Soochow would be an absurdity which he probably would be the first to condemn. But, happily for WOLSELEY, his name was not on the lists of the scientific services. So knighthood and important office at headquarters, the due meed of his great merits, were no sooner earned than they were ungrudgingly bestowed; and it is now announced that the government of Cape Coast Castle, with the command of the troops there, has been entrusted to this officer, who did not have the misfortune to be an Artilleryman or Engineer.

NAPIER of Magdala has, indeed, been often named as one instance at least that a scientific soldier may reach high command in the British service. But to do this is to show little knowledge of the realities of his case. For NAPIER owed his Abyssinian opportunity directly to the fact that he was already commanding at Bombay. And that he was thus highly placed, so far from its being at the instance of the Horse Guards, was due solely to the Indian Minister, himself a civilian, who absolutely refused to yield to the objection raised at home to an Engineer's receiving the commission of a Commander-in-Chief. In fact, although selected by the Indian Government, who knew his worth and appreciated his services, it needed all the firmness of the India Office to prevent NAPIER's claims being barred by the prejudice against his cloth.

And, as the Engineers have fared, so has it been with the Artillery. Excepting only WILLIAMS of Kars, whose opportunities were given him by the Foreign Office, and whose services, following these opportunities, were so approved by the voice of the country as to place him above the reach of professional jealousy, it will be proved, when the Return which was lately moved for by Mr. W. II. SMITH is presented, that the generals of that arm, however serviceable in peace, however distinguished in war, have, with one exception, found no place in our commands. Woolwich itself, indeed, being but a great Artillery school, is left to the corps; but only, as it were, on the condition that Artillerymen are to aspire to nothing else. The practice of other armies, the teachings of our own history in India (where this weak prejudice has been forced to yield to such practical necessities as those which sent POLLOCK to Afghanistan), the signal example of NAPOLEON becoming from a major of Artillery the greatest captain the world ever knew—all these are urged in vain on those who bestow our commands. It is even asserted that, when an appointment was not long since vacant which concerned the future of our staff far more than any other, and an officer was named for it as it were unanimously, whose eminence in military knowledge forbade any comparison of his claims with those of others, the old objection was raised at the last moment. Had it not been that once more a civilian

Minister, moved by the pressure of public opinion, was firm in a right decision, the nation would have been deprived of the services of one of the most distinguished of its servants for no other reason than that he chanced to be an Artilleryman.

Strange as these facts appear, they may be explained in a few words. For it is not an answer to say, as Sir H. STOKES replied to Mr. W. H. SMITH, that Artillery and Engineer officers are notoriously selected for various civil employments of a lucrative and honourable character. If they are found, by reason of original training or of after studies, so peculiarly fitted for responsible positions, this is but a stronger reason that the Horse Guards should not overlook their military claims. The true explanation is at once a plainer and more painful one. Hitherto our army has been composed of two great sections, the purchase and the non-purchase or scientific corps. Commands and high honours have been always regarded by its heads as part of the fair guerdon of purchase, when purchase was accompanied by desert. But desert alone, coupled with mere professional knowledge and hard service, has never had a share in them. Those on whom it fell to select, having been brought up in, and living constantly among, the purchase side of the profession, have hitherto viewed the scientific branches as a good and useful set of instruments, very properly to be encouraged in their technical duties, and to be rewarded, in their own line strictly, for special excellence in them. But any attempt on their part to step beyond the barriers of professional demarcation and seek the genuine soldier's prize, the command of a mixed body of troops, has been regarded as a sort of robbery of those who had paid for their steps. This, we believe, is the simple solution of the whole matter. But this odious and unwise division of the army has at last been swept away on the demand of the nation. Let us hope that with purchase will be buried the abuses which sprang from it, and that the army may in future be administered in the spirit of the neglected Regulations, so that those "of all arms" who have shown true merit "may be selected for situations of greater responsibility."

THE ACCIDENT SEASON.

THERE is a remarkable significance in the period of the year at which the worst railway accidents usually happen. Railway accidents and grouse come into season together. Accidents of a more or less serious kind are of course going on every day, but the great massacres of the year are reserved for the weeks between the end of July and the beginning of September. The recurrence of some appalling railway catastrophe somewhere about August may be predicted with almost as much certainty as the course of a comet or the return of the equinoctial gales. A prophetic almanack-maker need have no hesitation in annually appointing a terrific smash for this fatal season. We have only to go back a year or two to see how regularly and systematically these things happen. In this respect at least railway punctuality is singularly unfailing. The fearful slaughter on the Manchester and Wolverhampton line, when fifteen were killed and one hundred maimed and wounded; the Helmsboro accident, ten killed and forty injured; the Clayton Tunnel accident, twenty killed and one hundred wounded; the Abergele accident—all happened in August or the early days of September. The Kirtlebridge accident of last year was only a week or so out of its time. And now we find that the railway slaughter season has set in again with unabated severity. The disaster at Wigan has been followed by a rash of other so-called accidents. On Saturday it was repeated on a small scale at Miles Platting, where two carriages of a train struck the points and were thrown off the rails. As at Wigan, the points are of the patent interlocking kind, and we are assured that they were found to be set in the right direction. The history of the train which was broken into two parts last Saturday week at Wigan has also just been completed, and shows us railway management in its perfection. It appears that the carriages which escaped—by an accident, we should say—at Wigan would, but for another accident, have been made an end of at Coatbridge. At this point the engine broke down, and the passengers found themselves helplessly stuck fast on the main line, with the limited mail bearing down upon them. A man was sent back a mile on an unavailing attempt to stop the limited mail, which soon

after dashed up just as the other train had, by a desperate and final effort of its exhausted engine, been moved into a siding which was providentially at hand.

It may be safely said that there is nothing about which there is so little that is really accidental as these so-called railway accidents, and this is especially true of the August massacres. Their regular recurrence at this season is anything but a fortuitous coincidence. Like causes produce like effects, and it is simply because all the causes of accidents are in active operation at this period that accidents occur. This is the busy season on the railways, and the resources of a system which is severely strained by the ordinary demands upon it break down necessarily under an attempt to make it do an impossible amount of work. It has been proved that the train which was broken in two at Wigan was of exceptional length. It comprised twenty-five carriages, or five more than the longest that had previously been despatched, the ordinary number of carriages in this train being fifteen or less. It was the business of the pointsman at Wigan when the train went through to open the points in order to turn the Staleybridge train, which immediately followed, into the siding. This second train had already been signalled, and if the pointsman had acted on the supposition that the tourist train was not more than its usual length, he would have turned the points just in time to catch the hind part of the train. Whether he actually did so or not will perhaps never be cleared up, but it is possible that the exceptional and unprecedented length of the train may have disturbed his calculations. The official witnesses at this inquiry have given a wonderful account of Wigan station. It is an important junction, at which three or four different lines meet. About two hundred and thirty trains pass through it daily, of which thirty-five go through without stopping. All the passenger trains that do not stop go through "pretty much at full speed, "with steam on." The station-master says the traffic is incessant, and shunting is continually going on. In addition to the regular trains just enumerated, there are special trains and engines always flying to and fro, and "in the season sometimes six or seven excursion trains in a day." The shunting has very much increased, and is increasing, and the lines used by the trains which do not stop, as well as by the stopping traffic, are frequently blocked in this way. Here we have all the elements of disaster. A narrow, confined junction, overwhelmed with traffic; shunting on the main line constantly going on; irregular trains flying about; and, to make the thing perfect, "the Manchester train," the station-master tells us, "is occasionally run down the wrong line to save time." There are "sometimes trains standing on both sides of the platform, and when there are two or three trains on each side"—which happens repeatedly during the day—"they are sometimes rather hard pushed for staff." The station-master also thinks they "could do with more room." To attend to this incessant and bewildering traffic there are only a station-master, two inspectors, a foreman, and seven regular porters, with a couple of parcel porters, and occasionally one or two odd men. Yet in staff and accommodation Wigan is said to be much superior to most other North-Western stations. The engine-driver, STAWPERT, says that the drivers always look back carefully as they pass through Wigan, "because it is such a dangerous place." There is a very great strain on the shackles, owing to the rising of the bank, and after that there is a slight fall in the road. Yet the trains always run through it at full speed, though the district engineer has gone so far as to admit that "after an accident of this sort one could not help thinking it might be desirable not to run at such a speed through the station." But he was staunch in maintaining that "a bulge or excrescence on the main line, in conjunction with high speed," rather adds to the charm of railway travelling. It can only be owing to a series of the most surprising accidents that people are not constantly being killed at Wigan and similar stations. In fact, the station accommodation on the North-Western—look at Lancaster, another important station, for instance—is altogether disgraceful.

There is nothing more disheartening than writing about railway accidents which are not accidents at all, but simply the necessary and inevitable consequences of the reckless mismanagement and parsimony of the Companies. It is supposed that the press forms or guides public opinion, and that public opinion is omnipotent. But against these powerful corporations public opinion can do nothing. Year after year the same things happen, and the

same remarks are made. We could pick up, almost at random, a back volume of this or any other journal, and find there an article which would be just as appropriate to existing circumstances as if it had been freshly written. Newspapers, Board of Trade Inspectors, and all sorts of people are continually preaching the same sermon, but it is to deaf ears. It is nine years now since the QUEEN herself addressed to the Companies a personal remonstrance, which had almost the tone of humble entreaty, and begged them to try to kill as few of her subjects as possible. But nothing came of it. Railway Boards are quite aware that, as indeed HER MAJESTY pointed out, they have a monopoly of the business, and that they can do as they like. It would appear that, on a cool calculation of profit and loss, they have come to the conclusion that it is cheaper to kill off their thousands of passengers, and run the risk of being sued for damages, than to spend money in the first instance in providing for the safety of travellers. Sir E. WATKIN ingeniously observed the other day, in reference to an alarm of passengers who stopped a train because it had a red-hot axle, "Very probably it would have run to the end of the journey in safety"; that is to say, there was always a chance for the passengers, and what more could they expect? And this is really the happy-go-lucky principle on which railways are worked. It is clear, at least, that it is only in regard to the pecuniary consequences of accidents that Directors are at all sensitive, and that the remedy is to be sought in providing more summary means of making the Companies smart in pocket for their misdeeds. It is impossible to imagine any form in which public spirit—if there is anything of the kind left in the country—could be more honourably or usefully displayed than in organizing resistance to these reckless and unscrupulous corporations.

PILGRIMS TO PARAY-LE-MONIAL.

WE took occasion a year ago to call attention to the revived passion for pilgrimages throughout Catholic Europe, which appears still to be rapidly on the increase, and has now extended to our own country. In some shape or other, no doubt, the custom is not only as old as Christianity, but is common to all the principal religions of the world. Nor is this surprising when we consider how much there is to recommend it to the devotion, the curiosity, and, not least, the "love of novelty," which, as the old Eton Grammar reminds us, is also an instinct of human nature. Few Christians probably, of whatever communion, would view unmoved the scenes of the life and death of the Saviour, though they might not attach any supernatural virtue to a visit to Palestine; and we can easily understand the sentiment which, in an age of intense religious conviction, inspired the earlier Crusades. But the Holy Land has long ceased to be the favourite resort of pilgrims, though Mr. Cook may have done something in our own day to rehabilitate its claims. Rome had already in the middle ages become the chief centre of Catholic devotion, instead of Jerusalem, and in 1300 Boniface VIII. established the "jubilee year," originally instituted as a centenary festival, but which came by rapid stages to be observed first every fiftieth, then every thirty-third, and finally every twenty-fifth year. But though Rome is the Mecca of modern Catholicism, it shares its honours with a subordinate multitude of miraculous shrines scattered up and down every part of the Continent, more especially in Italy and France. The popular pilgrimages to Assisi and Loretto, which have lately assumed something of a political character, have been forbidden by the Italian Government on the very sufficient plea of the danger to the public health of those vast gatherings of the "great unwashed" in the hot season and with cholera in the air. But no such prohibition is of course to be looked for from the present French Government, and the rival attractions of Lourdes and La Salette having for the present been exhausted, there is just now a tremendous run, if the expression may be pardoned, on Paray-le-Monial, and England is called upon to supply its contingent of devotees. We should be sorry to say anything that could justly cause pain to religious minds, and the pilgrim idea, as the French would express it, is too ancient and too widespread not to deserve respectful treatment even from those who fail to sympathize with it. But there are pilgrimages and pilgrimages. It surely makes some difference how the journey is conducted and what is its appointed hour. It is not quite the same thing, for instance, whether the locality selected is indelibly associated in the mind of Christians with the most sacred scenes of the Gospel narrative; or whether it is a grotto where two children, whose subsequent career has by no means improved their reputation for piety or veracity, professed to have seen a vision of "Our Lady of La Salette," who talked to them in very bad French, and communicated some secret which the Pope is said to have put aside as "nonsense" when it was told him, and for which, at all events, nobody is any the wiser.

But before examining the claims of Paray-le-Monial on the reverence of the faithful, it is almost impossible to repress a smile

at the programme of the proposed expedition from England. A pilgrimage was formerly regarded, if not exactly as an act of penance, certainly not as a pleasure trip. We have all heard of the cunning pilgrim who boiled his peas, but our modern pilgrims are wiser in their generation. They not only dispense with peas in their shoes altogether, but with all the toils and pains of pedestrianism. Now there is no reason why a church should be dirty or uncomfortable, but still it is not a drawing-room, and one might pardonably feel a little sceptical as to the ardent devotion of a worshipper who bargained in the first place for a well-cushioned and well-curtained pew and an aristocratic congregation. Our English pilgrims, however, are to travel first-class, under the most distinguished patronage. If only a sufficient number can be induced to send in their names—and there are loud complaints of the tardiness of English Roman Catholics in responding to these attractive offers—the devout excursionists will have a special train and a special steamboat to themselves. The united Catholic hierarchy, assembled in Provincial Council at Ware under Archbishop Manning, have bestowed their solemn benediction on the enterprise, and the Duke of Norfolk is to conduct it. The pilgrims will start from Charing Cross on Tuesday morning, September 2, sleep at Paris—where hotel accommodation will be provided for them beforehand—start next morning at eleven o'clock for Paray-le-Monial, where they are to arrive the same evening, and may reach town again on Friday evening, after four days very agreeably spent. And the whole cost, first-class, will be only 5*l.*, with 10*s.* a day for hotel expenses. It is suggested that those who cannot go themselves may provide the requisite sum for sending a substitute who cannot pay his own expenses. Pilgrims whose tourist aspirations are more extensive can also be gratified; "other arrangements will be made for those who desire to make a longer stay in France." In short, it is to be a sort of magnified Whit-Monday trip, with the further advantage that in this case the ways of pleasantness are also the ways of piety, and virtue is its own reward in this life as well as in the next. It was Dr. Binney, we believe, who published a discourse on "How to make the Most of both Worlds." Were he not a benighted Protestant, he might find a new illustration of his very comfortable theology in the pilgrimage to Paray-le-Monial. It is all the rage in France just now, and Frenchmen of every class, from bishop to peasant—to say nothing of Frenchwomen—are swelling the stream by thousands and tens of thousands. But in England, as we hinted before, the schism seems rather to hang fire, in spite of all the machinery of press and pulpit devoted to its furtherance, and the delicate flavour of archiepiscopal and dual grace which is suffused over it. Englishmen are not as Frenchmen, and if this first-class pilgrimage has an air of the ludicrous, when considered from another point of view it is open to graver criticism. There are devotions and devotions, and one which combines the maximum of credulity with the minimum of reason—remembering the story of Margaret Mary Alacoque, we feel inclined to add of reverence—is not the most likely to approve itself to the more sober piety of our countrymen. But what, it may be asked, is the peculiarity of Paray-le-Monial, and why is it chosen for a resort of pilgrimage? We will explain as well as we can.

Towards the end of the seventeenth century, when the quarrel between the Jesuits and Jansenists was at its height, and the former were doing all in their power to promote that sensuous and mechanical style of devotion with which their adversaries so bitterly reproached them, there was a nun at the Convent of the Visitation at Paray-le-Monial, named Margaret Mary Alacoque. She had a disease of the breast, for which she is said, according to the practice of the time, to have been bled 192 times. But the disease was, in her own (probably sincere) belief, the result of a miraculous visitation. The details, which are copiously related in her biography, are not pleasant to repeat. Thus much we may briefly state; she asserted that she had been visited by Our Lord, who leaned His head on her breast, extracted her heart, and placed it in His own, where she saw it enveloped in flames. It was then replaced in her bosom, which ever after retained the wound, and she was charged, among other things, to communicate to the Church His desire that the worship of the Sacred Heart should be established. From that time forward she felt constant pain, which had to be relieved by bleeding. She was favoured with other visions also, of the Holy Trinity, and of Saints and Angels, on which we need not dwell. Her stories were very properly treated at the time as hallucinations—sufficiently common among nuns—and of the real nature of her disease there was no doubt. But some years later she came under the direction of the Jesuit Father La Colombière, who saw his opportunity, and made the most of it. From that time the devotion to the Sacred Heart became a speciality of the Order. In 1729 Languet, Bishop of Soissons, afterwards Archbishop of Sens, wrote a Life of Margaret Alacoque. He was a man of some power, but a vehement partizan of the Jesuits, and had poured out all the vials of his most scathing contempt on the Jansenist miracles, some of which are supported by a stronger weight of testimony than perhaps any other modern occurrences of the kind. But he endorsed the whole story of Margaret's revelations, and his book excited such ridicule that he had to withdraw the first edition, and even in its corrected form it was looked coldly on by his friends as quite unworthy of him. An Italian translation of it was suppressed by Clement XIV., and De Caylus, Bishop of Auxerre, wrote on the other side to expose the absurdity of the legend. The

subject was referred to the other day in the French Assembly in the debate on the new expiatory church to be erected on Montmartre, which it was intended—though the proposal has now been struck out of the Bill—to dedicate to the Sacred Heart. M. Tolain observed that this devotion was rejected by a great part of the Catholic world, that it had been condemned by one Pope and many doctors of the Church, and that a French Bishop (De Caylus) had described the Life of its foundress as “one of the worst books ever written.” But of course the Jesuits had their way, and the new cult—supplemented, if not ultimately overshadowed, by the auxiliary worship of the Immaculate Heart of Mary, of which another inspired nun was the foundress—advanced rapidly under their auspices. In 1794 an ex-Jesuit founded a Society of the Sacred Heart, designed to be a virtual continuation of the suppressed Order; and in 1800 some ex-Jesuits in Paris established an Order of nuns of the Sacred Heart (popularly known as *Jesuitesses*), which was approved by Leo XII., and has some one hundred establishments at present in different parts of the world. It was Maria Theresa “of the Sacred Heart” who, in 1771, predicted the speedy and terrible death of Clement XIV.; a prophecy fulfilled—as many thought by means of poison—three years afterwards. It was not till 1836, after the Jesuits had been re-established, and were regaining their old ascendancy at Rome, that the process of Margaret Alacoque’s Beatification was commenced, and it was only completed in 1864, when Pius IX., at their urgent solicitation, enrolled her in the number of the Blessed. The spirit of her revelations as communicated by Father La Colombière may be inferred from one of the instructions addressed to her by her Divine Visitant, which reads like an extract from the rule of St. Ignatius. “Not only,” Christ is represented as saying to her, “must thou offer up thy self-will, but thy judgment and understanding, to thy superior, and even if thou prefer her will to mine, should she forbid what I have enjoined thee, I am content.” Those who desire further information on the subject may find it in a work published at Paris in 1818, *Henri IV et les Jésuites*. We may add that it is only of comparatively late years, partly through Cardinal Wiseman’s influence, that this peculiar “devotion” has been introduced into England. Old-fashioned Roman Catholics, as might have been expected, did not take to it very kindly, and Bishop Huines, who was Vicar-Apostolic of the Western district before the new hierarchy was established, got into trouble at Rome for writing against it. No Roman Catholic bishop would venture to follow his example now; but the laity may perhaps be excused if they manifest no great alacrity, even with the adventitious inducements of first-class accommodation and a special steamboat, to pay their devotions at the shrine of Margaret Mary Alacoque, the nun of Paray-le-Monial.

THE END OF THE SHAH.

THERE is a vulgar but pathetic metaphor about going up like a rocket and coming down like the stick, which is irresistibly suggested by the recent adventures of His Majesty the Shah. He has passed away from us, but unfortunately he has not passed out of sight. He still lingers within view, dwindling and fading as he recedes, till soon he will be only as a faint speck on the horizon. The newspapers, which only a few weeks since filled their pages with him almost to the exclusion of everything else, have brought him down to a line or two of cold and distant recognition. If we want to trace his movements, we find them recorded in shabby little paragraphs hidden away in the ruck of miscellaneous telegrams. The climax of the play is long ago over, but still the curtain is kept up for a dull and tedious anti-climax. There can be no doubt that the artistic effect of the Shah’s visit has been spoilt by his not having been suddenly snatched up into the clouds when he took leave of us. He should have gone off in a blaze of jewels and fireworks, and disappeared while we were still winking. Instead of this, we see him dawdling on the scene after all the novelty and illusion of the exhibition have been exhausted. He has assured every nation of Europe in turn that he takes the deepest interest in its welfare, and will now die happy, having seen it, and has gone through the stereotyped routine of fireworks and reviews in a hundred cities, and the performance has grown stale and tiresome. His gradual approach to us was a different thing. He started on his travels as a sort of myth, looming vaguely through the mist, and gradually broke upon us as a reality. Every step he took nearer and nearer to the West stimulated curiosity, and all eyes were strained to discern the figure and lineaments of the strange apparition. All this helped to excite the public imagination, and to surround him with a halo of wonder and fancy. Yet even before he took his departure the prosaic reality had begun to be detected, and the last sparkle of romance flickered out when he passed from Paris into the hands of the select vestrymen of Switzerland. The fireworks, in fact, have burned out, and we are doomed to witness the silent falling of the dismal stick and the dull gleam of smouldering cartridge. The Shah’s journey was certainly a great theatrical coup, but it would have finished better if he could only have been got home somehow underground and out of sight. Superfluous legs the veteran on the stage, and yet he is only a veteran of a month or two.

Paris seems to have been the turning point of the poor Shah’s career. Till then he had been among serious nations, who had treated him seriously. The Russians and Prussians did not perhaps relish him very much, but at least they accepted him as a

solid fact. The English, too, received him seriously, and with more favour. It happened that just then they were desperately in the mood for amusement, and eager for a new excitement, but still they regarded the Shah as, on the whole, a substantial reality, and had even grave political views concerning him. But no sooner did he enter Paris than he became a joke, and we should think a greater trial could hardly await an Eastern despot. It is said that the Shah is himself exceedingly fond of fun in his own way, and a recent traveller to Persia has described the intense enjoyment which His Majesty derived from launching a crew of courtiers in an india-rubber boat, from which the plugs had been carefully extracted, and seeing them gradually sink under water. It has now been his own fate to undergo a somewhat similar operation. The plugs are certainly out of his boat. It is probable that the Court Chronicler who is supposed to be writing a narrative of this wonderful journey will, for the sake of his head, be rather disposed to slur over the return of his master eastwards. The brilliant hospitality of the French could not disguise their sense of the drollery of the whole affair. In their eyes the Shah was only a sort of man in the moon, or a pasha of burlesque, such as Mdlle. Schneider might be expected to play up to at the Variétés; and the way in which he had been toadied in England sharpened their derision. It may strike one as odd that the countrymen of Voltaire should take delight in such vile puns as “La nuit tous chats sont gris,” although it is recorded in history that when the First Napoleon as Consul entered Paris with a chariot behind him, someone cried, “Ah, le char l’attend!” Perhaps this love of petty punning is somehow connected with the Commune, and the Fusion will set all that and many other things right. But if the puns were poor enough, there was at least a sense of humour in treating the Persian monarch as a joke; and since then nobody has been able to think of him seriously. Our own fit of enthusiasm on the subject, the shouting mobs and grotesque frenzy of vulgar curiosity, will hardly bear the ordeal of cool reflection. Englishmen are usually shy and reticent from their fear of making fools of themselves, and it is unfortunate that in this instance the apprehension of that result did not prevent it from happening. The reaction which had set in almost before the Shah left our shores is not very likely to have a favourable effect upon the financial speculations with which the visit was associated. It was, of course, right and fitting that a foreign monarch should be received in a becoming manner by the Government, and there was no reason why the people should not give him a civil greeting. But there are limits in such cases which cannot be overstepped without loss of self-respect, and unhappily these limits were surpassed. It may have been no business of ours to sit in judgment on the Shah, and it was reasonable that we should desire to attach him as an ally; but experience of Eastern rulers has shown that sycophantic adulation is not always the most effectual means of securing their esteem, and that they are apt to measure the power of those with whom they are brought into contact by the dignity with which they conduct themselves. In any case, the fact remains that the sovereign of perhaps the most wretched, oppressed, and miserably misgoverned kingdom in the world has been received in a very different way from other potentates who have visited our shores. The Swiss, as a nation of innkeepers, probably considered themselves bound to show every encouragement to travellers from a distance, and had their own reasons for welcoming a new nationality to their international table-d’hôte. But the Austrians and Italians seem to have caught up the tone of badinage from the French. The Austrians have been making great fun of the astrologer who is supposed to determine for the Shah whether the hours fixed for his appointments are propitious. It is said that the seer is careful to provide himself with arguments against moving until he is quite sure that his master is ready, and it is added that His Majesty’s recent hosts have not been quite so patient under his persistent unpunctuality as those further West.

Among the latest despatches concerning the Shah’s progress, we read that at Bologna he “expressed great sympathy for King Victor Emmanuel and the Italian people,” and “previous to leaving for Brindisi he presented the Prefect with a gold watch, and distributed several Persian decorations.” At Brindisi the Shah again “expressed his pleasure at having met King Victor Emmanuel, at the same time wishing the Italian nation every prosperity,” and no doubt there was another distribution of watches and decorations. One of the curiosities of this journey will be a list of the gifts which the Shah has distributed in Europe, and the articles which he has received in return, with a statement of the weight and dimensions of the vast heap of official addresses which have been presented to His Majesty, and which he is supposed to be carrying back with him to Teheran. It is said that in his own country the Shah leads a simple life, and it will probably have now charms for him on his return home. It is impossible to imagine anything more wearisome and fatiguing than the endless repetition of empty ceremonies and conventional compliments. The poor man must by this time have had enough of state receptions, reviews, garden parties, and official addresses which could neither be prevented nor evaded. It is now nearly three months since he first reached Europe, and during the whole of that period he has been the victim of incessant and exhausting hospitalities. He has now reached Constantinople, and may consider himself once more in the East. The laborious monotony of his movements must surely during the last few weeks have become irksome and unpleasant. It is not unreason-

able to conjecture that, if circumstances had permitted, he would gladly have escaped by a short cut from the civilities which have been heaped on him, and that some of his hosts would also not have been violently disappointed if they had been spared the necessity of entertaining him. It is obvious that a journey of this kind places both parties in a false position, because it is a position of obligation and constraint. The countries which are visited feel bound to do the honours to their guest, while he, on his side, having accepted hospitality in one quarter, cannot refuse the offer of it in another. The journey will entail a heavy drain on the resources of a sadly squeezed and impoverished country, and, if it has ministered to the personal gratification of the monarch, that is about all that can be said for it. It would be ridiculous to suppose that it can be attended with any political results. It is possible that the Shah may be weak enough to imagine that personal observation during a hasty tour under highly artificial circumstances has enabled him to measure the relative strength of European Powers, and to gauge their feelings towards himself. If so, that only proves his folly, and there is no reason to suppose that conclusions drawn in this manner are at all likely to be less fallacious than those which he might have formed at home. A confidential counsellor with leisure and funds might have been trusted to bring back a more ample and trustworthy stock of information than the Shah can possibly have collected during his round of fêtes and fireworks.

Of course when a potentate of this kind intimates his intention of going on his travels, it is difficult for foreign Governments to point out to him that perhaps he had better stop at home. Such journeys are very costly, and not very profitable in other ways, especially as they are more likely to lead to jealousies and misunderstandings than to good results. It has not been announced that the Shah will return to Europe to offer his personal thanks to the subscribers to Baron Reuter's speculations; and even if he were to cherish this idea, the extreme remoteness of the date at which it would require to be fulfilled is enough to relieve us from any apprehensions on the subject. It appears that that nice prince, the Sultan of Zanzibar, is emulous of enjoying British hospitality, and that we may shortly expect him on a visit. Possibly the King of Dahomey may also be inspired with the idea of paying us a similar honour, and then we shall have a real savage at last.

MODERN ARCHEOLOGY IN DEVONSHIRE.

WE have copied the heading of an article in the *Pall Mall Gazette*, which we should have been better pleased to have been able to take some notice of last week, in which a new light has appeared to explain to us the early history of England, and especially of its Western portions. It is plain that the writer is not one of the class whom real knowledge of one subject leads to deal modestly with any other subject with which any accident obliges them to deal. It is also plain that the details of the English Conquest, especially in the West, are a pet subject with him, of which he fancies he is master, and about which he is quite entitled to lay down the law. His opening paragraph would betray him, without going at all into the substance of his discourse. "London task-work in July," "the great northward and continental migration of August," "the serious work of sporting," "science and literature shrinking within their proper dimensions"—this kind of talk reveals the man. To those who do the serious work of history, whether from the professor's chair, in the parsonage, or in the country-house, all this is simply the amusing chatter of one who knows only a single very narrow form of human life.

After this little flight of playful cockneyism, our new instructor condescends so far as to "fix his graver eyes on the proceedings of the antiquarian division of those wayfarers." The class of "wayfarers," as far as we can understand this style of writing, takes in the members of the Archaeological Institute holding their meeting at Exeter, the regiments passing to Dartmoor, and—we do not exactly see why—an "abundant and agreeable clerical sprinkling," and "the female half of the Devonian race," whose "oscillating tastes" are said to "find balance and repose" between "red coats and black." This kind of talk hardly prepares us for grave discourse about King Æthelstan, still less for a general discussion of the principles of historical evidence. Our teacher begins by telling us that "the history of the West of England, at all events down to the time of the Conquest, is most happily obscure." He then goes on thus:—

Its remote situation and the peaceful habits of its people placed it in the proverbially blessed condition of a land without annals. Its memories of courts and battles were legendary only—those of Arthur and his Round Table, or of the landing (equally well authenticated) of Brutus the Trojan at Gwines. All that is really known—that is, on fair and consistent chronicle authority—of the events which occurred in it might be comprised within a couple of octavo pages. That a struggle, or succession of struggles, must have taken place there before Devonshire and Cornwall were confined within their now respective limits must needs be inferred from probabilities; but all dependable record concerning it has vanished like those of Milton's "battles between kites and crows."

The kites and crows were of course sure to come in in this kind of talk; but the writer hardly sees that the proposition that struggles took place which have failed to be recorded because they were not worth recording—which is the only meaning of the kite and crow saying—is hardly consistent with the other proposition that the men of the West have no annals because they were so peaceful; as

this can only mean that there were no struggles at all. We are left to guess whether it was the Britons of those parts who were so peaceful that they did not withstand the invading English as they did in other parts of the island, or whether both Britons and English were so peaceful that the English managed to creep in unawares without any struggles at all. But perhaps we are not to look for very accurate distinctions of this kind from one who talks about "dependable" and "undependable"—rivals, we suppose, of "reliable" and "unreliable"—and who puts Arthur and Brutus on a level. The really odd thing is the principle he seems to lay down that nothing is to be believed unless on "fair and consistent chronicle authority." Laws, charters, documents of all kinds, which, when we can get them, we commonly rate higher than "chronicle authority," are all, it would seem, to go for nothing. We think that Mr. Kemble alone has printed a good deal more than two octavo pages from Devonshire and Cornwall, to say nothing of a good many folio pages in Domesday, and to say nothing of documents from Somerset and Dorset, two shires which are surely needed to make up the West of England. We assume that by the "Conquest" is meant the Norman and not the English Conquest, and, if so, nothing can be further from peaceful than the annals of the West of England during the ninth and tenth centuries. There was constant fighting with the Danish invaders. Exeter was besieged over and over again, and Ecgberht's victory over Danes and Britons at Hengestesdun is generally held to have some bearing on Cornish history.

We are next treated to a paragraph about Catherine the Great and Sir Gilbert Scott and his "mymidons"—we never could guess why that particular division of the Achæans before Troy should have become at once proverbial and shorn of their initial capital—the drift of which is that inquirers into early English history never venture to say "I do not know." This the *Pall Mall* writer tells us in plain English, and so we understand him. We are less clear when he talks in the grand style about "the progress of dogmatism and positiveness, and the general adoption of the categorical instead of the hypothetical style." It is some comfort that hard words break no bones, but to assert that inquirers into early English history never venture to say that they do not know, would be, in any one who had really studied the writers and speakers of whom he is talking, a mere slander. Nothing is more distinctive of the critical school of inquirers, the school against which the *Pall Mall* writer has chosen to tilt, nothing distinguishes them in a more marked way from their predecessors, than readiness to say that they do not know, when they do not know. The truth is that this writer seems to grudge anybody knowing anything. He seems to look upon a time of which nothing is known as so picturesque that it is a pity to find out anything about it. "All that is decayed must be renewed; all that is dark brightened; all venerable obscurity dissipated. All must be naked, positive, glaring." We confess that we are always glad to dissipate venerable obscurity whenever we can; the only question is whether we can or cannot dissipate it in any particular case. But this writer seems to look on obscurity as so venerable that it is a crime to dissipate it, even if we have the chance.

After this we come to the general doctrine that

Much of that we are now bid to receive as authentic mediæval history consists of nothing except the crotchets of clever men, first timidly hazarded as guesses, then protruded as probabilities, and lastly announced as established propositions.

We are less clear than we could wish about these stages, and about the second one in particular; the process of "protruding probabilities" is, as far as we are concerned, shrouded in a good deal of venerable obscurity. But the crotchets are in this kind of writing yet more inevitable than the kites and crows. When one man has thought about a thing which another does not care to take the trouble of thinking about, it is at once so very easy and so very grand to pool-pool his conclusions as a crotchet. The formal comes as a matter of course; so we are in no way disturbed by it. But now comes the main onslaught. "No name has been more glibly forward on men's lips in Exeter last week than that of the respectable but very hazy monarch, King Æthelstan." We are glad to find Æthelstan spoken of as "respectable," as that implies at least an acquittal from all share in the death of his brother. But when a prince who fills such a place as is filled by "Glorious Æthelstan," both in insular and in Continental history, is slipshodly set aside as "very hazy," we suspect that the haziness is what might, in the philosophical style of the writer, be called subjective rather than objective. Our writer is so anxious to create haziness, venerable obscurity, and the like, that he blows out the lights or purpose. William of Malmesbury has treated the life of Æthelstan with special minuteness from lost sources. The *Pall Mall* writer indeed tells us that this is "a suggestion to which no word in the chronicler himself gives any support." William of Malmesbury is not a chronicler, and therefore, according to the standard of the *Pall Mall* writer, he is not entitled to belief on any matter. Yet we venture to believe that he did use lost sources, when he refers to sources which, as far as we ever heard of, are lost. As we read his long, careful, and sometimes critical, account of Æthelstan, we find him referring to at least three such sources—we might say four—for he quotes at length a charter of Æthelstan himself, which, as far as we know, is not to be found elsewhere. And, in referring to his three other sources, he draws a marked distinction between them as to their value. Some things, he says, come from ballads in which he puts but little confidence ("magis cantilenis per successiones temporum detritis quam libris ad instructiones posteritatem elucubratis"). Other things he tells us

the authority of a certain "versificus," from whom he quotes a good many Latin hexameters; but it is plain that he mainly relies on a contemporary writer, whom he speaks of as having been in Æthelstan's favour, and therefore warns us against his excessive praise of his patron ("laudum nimietatem adornat favor Æthelstani ad huc viventis"). When, in the face of this, we are told that no word of William of Malmesbury gives any support to the suggestion that he followed lost sources, one cannot help suspecting that the bit about Exeter is the only bit which his critic has read.

As for the general value of William of Malmesbury, the student of history will simply smile at seeing him put on a level with Geoffrey of Monmouth, and being told that his "credibility does not stand very high with modern historians, except when they need him to support a theory." William of Malmesbury has his faults, but he is a writer who improves on acquaintance. That is because his main fault, his lack of strict chronological order, which is at first so provoking to those who turn to him from the strictly annalistic writers, is closely connected with his chief merit, the critical and philosophical spirit in which he at least tries to write, and the way in which he constantly sets before us two or more contending versions of the same thing. Like other people, he sometimes shows prejudice; he sometimes, as in the case of William Rufus, shows a want of speaking the whole truth against powerful men; but we see no reason to suspect him in any place of mere invention such as the *Pall Mall* writer seems to impute. In fact, the story about Exeter is one which there could be no conceivable motive to invent. It is the sort of thing which was not the least likely to come into William of Malmesbury's head, unless he had really found it in the old contemporary book to which he refers. And, though the event recorded in it is not directly mentioned by any other writer, corroborative evidence which looks the same way is not lacking. We venture to look on the evidence of documents as at least equal to that of "chronicles," and documents distinctly point to a special connexion between Æthelstan and Exeter. It was at Exeter that he and his Witan put forth one of the great statutes which bear his name—a solitary example in those days, as far as we know, of a gathering of the national Council in the Western capital. All the charters, genuine and spurious, earlier than Edward the Confessor, which are dated at Exeter or in which Exeter is mentioned, belong to Æthelstan's reign. Here then is a marked feature, puzzling at first sight, but which the statement of William of Malmesbury fully explains. There is also something very amusing in the way in which the *Pall Mall* writer calls William of Malmesbury's local knowledge in question, because he "represents Exeter as a 'magnificent and wealthy city.'" People of this kind cannot understand the different standards by which things are measured at different times and places; because modern Exeter is not on a level with London or Paris, and because ancient Exeter was doubtless positively far below modern Exeter, this writer cannot understand the great relative position which was held by ancient Exeter, as by ancient Lincoln and by a crowd of other cities which have positively advanced, but which have relatively gone back. He mocks also at the account which William of Malmesbury gives of the soil as only growing oats. We do not profess to be well up in the agriculture of the district either then or now; but, at all events, the notion was not peculiar to William of Malmesbury, as the Jew in Richard of the Devizes, in his satirical description of the cities of England, says, "Exonia eodem farre reficit homines et jumenta." As to the statement itself, he altogether misconceives its meaning. He fancies that what is meant is that Devonshire was not conquered till the time of Æthelstan, whereas William of Malmesbury's story itself—to say nothing of the earlier notices of Exeter in the time of Alfred and other notices of Devonshire earlier still—implies that Devonshire had long been an English possession. All that William of Malmesbury says is that there were still Welsh citizens, and seemingly a separate Welsh quarter, in Exeter, just as there was an English and a French quarter in many English towns in the days of the Conquest, as in Wales and Ireland there often was an English and a Welsh quarter, as in Germany there often was a German and a Wendish quarter. No one but himself ever dreamed of "huddling three great conquests—of Yorkshire, Wales, the West—into a very narrow space for so 'unready' a race as the Saxon Kings of two or three years." The English here is none of the clearest, and as for the unready race, we can only guess that here is some confusion between Æthelstan and Æthelred, or perhaps between Æthelstan the Glorious in history and Atholstan the Unready in *Lynches*. How much our new teacher knows about Æthelstan and his chronology appears from his placing his reign "only a hundred years before Domesday Book."

We are told also that "there is not the shadow of authority save William of Malmesbury aforesaid for the fact that there ever existed in the district a mixed population of Celts and Saxons together, any more than in Eastern or central England." We simply appeal to the laws of Ine, with their elaborate scale of wergilds for the Englishman and the Welshman severally, a feature which is distinctive of the West-Saxon laws, and which has no parallel in the laws of Kent. The writer then goes on to cut his fingers with local nomenclature, and to mock at all attempts to see a Celtic element in the local nomenclature of Devonshire, much more than in that of Somerset. We do not wish our teacher so ill as to wish to see him crushed, like Enkelados, beneath the weight of all the Somersetshire Penns, but we would ask how names like Pennard come to be common on both sides of the Bristol Channel, and how

the unaltered Welsh name Lydiard comes to be so well known, not only in Somerset, but even in that small part of Wiltshire where the Briton maintained his independence down to the battle of Badford. In short, however skilful our *Pall Mall* teacher may be either in "London task-work" or in "the serious work of sporting," he would be wiser if he left modern archaeology, in Devonshire or anywhere else, to those who have read the ancient authorities, and who are able to judge of the force of what they have read.

THE JOYS OF YACHTING.

SO long as Britannia continues to rule the waves, it would of course be rank blasphemy to say anything against yachting. Nor do we propose to do so. Although we confess frankly to having few sympathies ourselves with the sea, we can feel with the fortunate few who thoroughly enjoy it. Even out of our own worse than chequered experiences we can recall moments when our lungs expanded to a freshening breeze with voluptuous gusto, when we positively enjoyed the roll of the vessel, trod the creaking planks with the tolerably assured step of one who had triumphed over the feebler part of his nature, and seated ourselves with the ravening appetite of a shark under swinging lamps among clattering crystal. Moments of the kind have been but few and brief, it is true, and they have generally been preceded by several days of training more or less severe. Yet they assist us in appreciating the feelings of the lucky yachtsman whose peculiarly welded constitution raises him above the weakness common to humanity. Whether he is sensible of the preliminary twinges of those horrible spasms which prostrate ordinary landmen in voiceless agony is a secret between himself and his conscience; at least in his imperturbable resolution he never suffers any signs of them to appear. If he ever does have threatenings of sea-sickness, it is clear that he counts upon his meals as infallible specifics. There is nothing delusive about the uncompromising manner in which he handles his knife and fork, in his reckless dealings with the richest *entrées*. If he be a smoker, he smokes on in defiance of the weather, and the only question that troubles him is snug shelter for his cigar. Such a man is plainly in his element on board ship. If he be blessed with money and leisure, it is his bounden duty to become the possessor of a yacht, or a fleet of them. The channel of his responsibilities is buoyed out for him by his natural gifts, and it is his business to become a patron of the noble calling which has made the glorious prosperity of his native land. He is marked out to keep in his pay a select corps of seamen of *élite*, and to see that they enrol themselves in the naval reserves, ready to respond to the call of their country, should their country ever be in danger. If he be ambitious of racing cups, or have a turn for shipbuilding, so much the better. Then he is always changing one vessel for another, altering a line in the hull here, or a something in the cut of the canvas there; encouraging industrial talent in Channel building-yards, and improving on swift models for thrilling international contests. Perhaps he has enough of pluck or has mastered sufficient experience to become his own sailing-master. There are owners who have navigated their own yachts from the quiet waters of Cowes to the misty banks of Newfoundland. A man like that, we repeat, is to be regarded as among the most enviable of mortals. He casts off for a cruise, and leaves black care on the shore behind him. He issues his own sailing orders as he goes, and is absolved from the necessity of laying his plans beforehand. The ocean leaves no trail, and if he ships his wife, or if he has no wife, he can sail away into space with an easy conscience. He has not to make points as he goes; to run the gauntlet of ticket-offices and waiting-rooms, and put up with the leakings of the accommodation in second-class hotels. There are no ominous packets of letters awaiting him at the local banker's or the *poste restante*. He may even spare himself the chance of the shock that comes of stumbling on some unpleasant announcement in the papers. If he is a sensible man, he naturally seeks complete change of scene, and courts communion with nature in comparative solitude. His vessel is a tiny one, no doubt, compared with those Cunard and Laman liners which we should infinitely prefer for our own part. But to him it is instinct with life and vigorous motion, and what is more, it absolutely answers to his will. After all, it is far bigger and better found than those in which the early Arctic adventurers went groping their way through the ice-floes off Spitzbergen, and along the icebound shores of Ballin's Bay. If his conscience is as comfortable as we may assume it to be, we may be certain his *physique* is in prime condition; of course his spirits rise accordingly. It is positive rapture to him standing on the heeling deck in the fitful moonlight, and hearing the white-crested waves go rushing past his clean-cut counter as his little craft goes pitching over the swell. There may be a sense of freshening even in the heavy plash of the falling rain that has beaten down the crests of the rollers, and there may be not unpleasant excitement in feeling his way in a fog, when, in spite of the fog-bells and the sharpest out-look, there is always on the cards for him the chance of a collision. We suspect it is the love of the danger quite as much as the enthusiasm of geographical and scientific research that sends courageous gentlemen to the polar seas instead of into more balmy waters.

All that sort of thing is delightful for men whose hearts are on the sea, and whose bodies work independently of all eccentricities of motion. But such men are few, while yachting men are many,

and there is a general delusion that a yachting cruise is like taking a holiday from earth on a buoyant bit of paradise. A mere yachting picnic is all very well no doubt, when you enjoy it in lovely roquatta weather; that is to say, when the sun is calmly shining on a sea that is gently rippled by the play of the cat's-paws, when you are never out of sight of the coast, and when you have quiet and comfortable moorings within easy reach of you. Then, in the most ratty of nautical costumes, you tread your friend's decks with the swagger of the sea-bred buccaner: you bear yourself as if you were absolutely indifferent to the very dirtiest weather, and coolly cock your weather eye at the cloudless horizon with the air of an ancient mariner looking out for squalls. Under the exhilarating influence of the champagne that foamed so freely into the glasses at lunch, for the moment you honestly believe you are weather-proof. Perchance in the spirit of hospitality generated in the genial after-luncheon atmosphere, and in sympathy with your thorough enjoyment, your good-natured friend invites you for his autumn cruise. It is an invitation which ninety-nine men out of a hundred would jump at, and you jump at it accordingly. So you find yourself back again on board the *Sea Queen* a fortnight later, and are bound, we will say, to the coast of Norway. It is not so very far off; a pleasant bit of a run before the wind; indeed you are only sorry that the pleasure will be so quickly over, having taken pains to inform yourself of the average length of steamer passages from Hull to Christiansund. However, it was something like what you might call a sea, even as you steamed over the Southampton Water, and the little dingy that takes you from the shore to the *Sea Queen* bobs about decidedly disagreeably. There is a faintly ominous whistle in the rigging overhead, something like the low meanings of a Banshee hovering somewhere a good bit off. It strikes you with similarly sinister presentiments, and you are not much reassured by the swift scud of the clouds against the watery moon as you lift your eyes to the heavens above you. However, there is no help for it; your pride is piqued to show your carelessness, and you know that your friend would make it a point of honour to sail were the weather far more threatening than it is likely to be. When you have stood out beyond the shelter of the shore, you are informed that there is a bit of a breeze blowing. A bit of a breeze it may be, or half a gale, or a whole one; at all events, you find it more than enough for you. You have a sense that the slippery morsel of a thing you have shipped in may go sliding from beneath you before you have time to miss her; now and again she heels over to the blast, as if it had got fairly under her and was in the act of heaving her over. Your heart is often in your mouth than elsewhere, and you could fancy your stomach had changed to something like a jelly-fish. The appointments of the small cabin are unimpeachable in their elegance, but by a natural affinity of material they remind you irresistibly of the last steamer saloon you suffered in. Yet on board that steamer, miserable as you were, you had a sense of stability and safety, a sense that is altogether lacking here. You had embarked on that steamer to make a voyage as matter of business, and were in a position to calculate approximately how long your sufferings were to endure. It is understood that you have sailed in the *Sea Queen* for pleasure, and, in fact, your three friends are to all appearance veritably cheerful. How long it may be before you sight the historical shores of the Vikings you know not; that is an affair which you must leave to the winds and the waves. You only remember that, once arrived there, you have still to live on board, and that liberty days on the solid land will be doled out to you more or less charily. Then you are condemned to return as you went, and it is idle to cast about for a means of escape. You have made yourself one of a quartet, and it is impossible capriciously to break up the rubber, and reduce your friends to make shift with a dummy. A doctor's certificate is out of the question, hopelessly ill as you may feel yourself now. The moment you set your foot on shore again you will show all the better for your jumbling. So you must make the best of the bad bargain you so rashly rushed upon, and lie groaning in your dancing cell with no ray of immediate hope to lighten the gathering darkness.

We have depicted the very real sufferings of one of the many gentlemen who have imprudently accepted yachting engagements for the autumn without counting the cost beforehand. But what are we to say of those affectionate and unfortunate wives who have taken yachting husbands for better and worse, and who cling to them by sea as well as by shore, although they are invariably martyred by horrible sea-sickness? We have known cases where ladies have followed their husbands' floating fortunes with touching constancy, although this mode of proving their affection could scarcely tend to their mutual contentment. Love may be strong as death and stronger. But it needs a most conscientious appreciation of feminine devotion to allow for the petal-like inevitability generated by the squeamishness that comes in a squall with each rise of the wind and fall of the barometer. An angel would show to disadvantage when her ruby lips have turned to the tint of her chalky cheeks and when all the warm blood in her person has set strongly towards the tip of her nose. The most graceful form can scarcely preserve the graceful undulations of its contours as it hangs limply over the low bulwarks. Children should be a blessing at all times in well-regulated families, but a floating nursery is sure to be a noisy and fractious one. The family man who ships his penicils for an autumn cruise may look forward to the renewal of his domestic joys when cruising singly in the sheltered flocks of Norway or among the sunny isles of Greece. But there

is much to be gone through before he reaches those happy cruising grounds, and it may well be a question if the game is worth the candle.

PROGRESS OF THE ECCLESIASTICAL CONFLICT.

IT is not at all wonderful that Catholic Governments, or Governments with a large body of Catholic subjects to deal with, should find their difficulties rapidly growing on their hands. In one sense indeed they have themselves to thank for a crisis which they might probably have averted with a tenth part of the trouble in which they now find themselves involved. It may be in the recollection of our readers that Prince Hohenlohe, the Prime Minister of Bavaria, addressed a circular shortly before the assembling of the Vatican Council to the great Powers of the Continent, calling their attention to the political bearing of the dogmas which it was notoriously the aim of the Court of Rome to establish, and urging some joint action on the part of the European Cabinets which had, according to all former precedent, an indisputable right to be represented at the approaching Synod. But the leading statesmen of other countries did not share his views. Partly perhaps from a disinclination to take their cue from one of the smallest Catholic States, and still more from a facile reliance on the modern Liberal doctrine of the independence of Church and State, and the absolute indifference of religious doctrines to the State, as such, they declined to interfere. And they were studiously encouraged in this policy of abstention by the tone of the Ultramontane journals, which up to the last moment persistently denied or disguised the real objects of the Council, and by the official assurances of the Court of Rome that the relations of Church and State could be in no way affected by its deliberations, and that ambassadors were not admitted now as heretofore, because the two Powers had ceased to be united, although this very separation had been just before anathematized in the Syllabus. The event has verified, as every one who knew anything about the matter felt sure all along that it would verify, Prince Hohenlohe's anticipations in every respect. The measures which it was found convenient to disclaim beforehand were forced through the Council, and it appeared soon enough that the Jesuits, who were their real authors, did not intend them to remain a dead letter. It was absurd ever to imagine that this could be the case. The Roman Curia may have lost something of its traditional astuteness, and there can be little doubt that in enacting the infallibilist dogma it has forged a two-edged weapon which sooner or later is sure to be turned against itself; already, indeed, it has provoked an organized resistance throughout Germany and Switzerland, and given a fresh impulse to the sceptical tendencies of the day within, as well as, to some extent, without, the borders of the Roman Catholic Church. But the Court of Rome and its Jesuit advisers were not so irrational as to force through a momentous decree, which revolutionizes the whole basis of Catholic belief, in the teeth of a strong opposition, without any practical object at all. They knew well that it must necessarily effect an entire unsettlement of the moral and religious beliefs of all who seriously accept it, and, which is more directly to our present purpose, that, whenever it is consistently carried out, it must derange all the existing relations of Church and State. That multitudes, both of priests and laymen, have professed to accept the new definitions of Papal infallibility and universal ordinary jurisdiction, without any perceptible change in their views and line of conduct, is quite true, but that only proves that their submission is an empty form. The bishops are in a different position; whatever may be their private opinions, they cannot publicly affirm a doctrine and then decline to act upon it. Accordingly Catholic Germany and Switzerland are in a blaze. The prosecution, now pending, of Archbishop Ledachowski for ignoring the new law in his appointments to benefices, and the standing quarrel about the inspection of seminaries in every Prussian diocese, supply obvious illustrations of the growing intensity of the quarrel. But far more important, both in its bearings on the Old Catholic movement and on the general condition of ecclesiastical affairs in Germany, is the recent decision of the Supreme Court of Appeal at Berlin, to which we now desire to call attention. Its probable influence on the future of the movement is obvious enough, when we remember what a large proportion of mankind are either more or less indifferent to the question of religious truth, or, if they have decided convictions, lack the courage and endurance to avow them at the cost of serious inconvenience. In Germany infallibilism has got the name of *Hungerdogma*, and of course to the clergy, who are mostly dependent on their office for their bread, it makes all the difference whether the avowal of Old Catholic principles involves the loss of their status and means of livelihood. Henceforth they will know that in Prussia no such issues are involved.

The question arose in this wise. An Ultramontane priest of Rhenish Prussia had published a violent and abusive attack on the Old Catholic services, and was prosecuted for a breach of the 166th Article of the Penal Code, which prohibits any insult being offered to the worship of religious societies recognized by the State. The local Court refused redress, on the plea that the Old Catholics did not belong to any recognized community, having left the Roman Catholic Church, and not having obtained civil recognition as a separate body, the Evangelical and Catholic Churches being the only two known to the law in Prussia. Against this strange ruling, which left them at the mercy of any zealot who might choose to hound on a fanatical mob to outrage their

churches and disturb their solemn worship, the Old Catholics very naturally appeal to the Supreme Court at Berlin; and its decision, which simply affirms the position assumed by themselves from the first, has an importance, direct and indirect, reaching far beyond the particular occasion which evoked it. The lower Court had rejected their claim to be regarded as Catholics "in the sense of the patent of 1847," on the ground of their not accepting the decrees of the Vatican Council passed in 1870, and therefore not holding Catholic doctrine, and this notwithstanding their publicly reiterated assertion that they maintained precisely the same doctrines which they had always held and taught, and the official denial by the Prussian Government of the legal validity of the Vatican decrees. The Supreme Court of Appeal has reversed this sentence as "not proceeding on judicial principles, but on grounds of ecclesiastical partisanship, one-sided, and capricious," and then pronounces as follows:—"As to the forming of a new religious society in the sense of the patent of March 30, 1847, that cannot affect the Old Catholics, but rather the New Catholics, who are, in fact, setting up a new doctrine, and, on the strength of their being in actual possession of the Catholic churches and Church property, demand to be treated as the sole true members and representatives of the Roman Catholic Church." It would be impossible to lay down more distinctly the full and paramount right of the Old Catholics to be regarded as true members and representatives of the Catholic Church in the only sense known to the law: and, considering that they maintain unchanged all the doctrines of the Church with which the compact of 1847 was made, it is difficult to see what other decision could have been given. It follows of course that the large and increasing body who have joined Dr. Dollinger in rejecting the new dogmas of the Vatican are entitled to all rights and privileges accruing to them as Catholics, and that their clergy are eligible to any benefices or bishoprics which the Government may have to bestow. It is difficult, we repeat, to see how any other verdict could have been pronounced consistently with the admitted facts of the case and the attitude assumed all along by the Prussian Government towards the Council. But the Ultramontane organs, keenly conscious of the probable results of the decision, feel or affect an astonishment which appears almost to have deprived them of the power of articulate utterance. The *Germania* styles the judgment "insolent, monstrous, and simply ridiculous," professes to doubt its genuineness, and accuses the reporters of insulting the Supreme Tribunal. The *Tablat* more concisely describes the judgment as "fudge," and with that elegant and racy freedom of diction in which Ultramontane controversialists are unrivalled, calls the Old Catholics "Dollingerists, Schultists, Professorialists, Connubialists," &c. But hard names break no bones and alter no facts. Meanwhile, in accordance with the invitation issued by Dr. Schultze, as President of the Old Catholic Congress, a large assemblage of clergy and laity met on Monday last in the Laurens Church at Deventer, to witness the consecration of Dr. Reinkens, as missionary Bishop for the Old Catholics of Germany, by Mgr. Heykamp, Bishop of Haarlem. The new Bishop of Haarlem was consecrated at the same time. The ceremony, as we learn from the report of a correspondent who was present, was in strict accordance with the Roman ritual, except that the customary Bulls and oaths of allegiance to the Pope were of course omitted. The church was crowded, and after the function Mgr. Heykamp delivered a long address in Dutch to the newly consecrated prelates and the clergy and people, which is said to have produced a profound impression. He dwelt on the grave significance of the ceremony just concluded and the important duties which Bishop Reinkens would have to discharge, and pointed to the fact that the Old Catholic Church of Holland, which was sometimes said to be dying out, was now being reinforced by the thousands and tens of thousands of their brethren in the faith who were flocking to join the Old Catholics of Germany. Bishop Reinkens has issued a pastoral, which, however, is not yet before us, and it is understood that he will fix his residence at Bonn.

In Switzerland a meeting of the delegates of the various Old Catholic congregations already established in the country is announced to be held at Olten on the 31st of August, with special reference to the approaching Congress at Constance on September 12, which the Swiss deputies have been most cordially and pressingly invited to attend. The question of the future relations of the Swiss to the German movement, which has hitherto been one of moral sympathy and support merely, thus becomes a matter of practical urgency. And this, as the programme of the meeting at Olten points out, involves the further question of the internal organization of the Old Catholics in Switzerland, and the means to be adopted for effecting the necessary reforms in worship and discipline. It behoves them to consider whether the time is not now arrived for establishing an Old Catholic bishopric for Switzerland also. At a meeting of Liberal Catholics from eleven Cantons held at Bern last week, it was resolved that this matter should be at once taken into consideration, and the large congregation of Old Catholics at Geneva were urgent for a speedy settlement. It is accordingly with a view to discussing these points, in preparation for the Third Old Catholic Congress summoned for September 12 at Constance, that the Swiss deputies are to meet at Olten on the last day of August.

If from Europe we turn our eyes to South America, there too the Vatican Council is seen to be producing its natural fruits. The quarrel between the Roman See and the Government of Brazil has been brought to a head by the public excommunication of some Freemasons by the bishops, acting under orders from Rome, without obtaining the civil sanction required by law, and followed by

the refusal to marry or bury them, and to baptize or confirm their children. This has led to popular tumults at Pernambuco, which could not be put down without the intervention of the military; and, on a formal complaint being made to the Council of State, the Bishop was censured for illegal conduct, and required to withdraw his excommunications. He refused, and is being prosecuted by the Government. So far the story reads very like a page out of the latest ecclesiastical records of Prussia. But there is, in fact, a deeper and more long-standing ground of discontent in Brazil, which is probably indicated in the rumour that the Government contemplates retaliating on the bishops by the establishment of obligatory civil marriage. This does not at first sight appear to have any very close connexion with the excommunication of Freemasons, and looks like rather an extreme measure for a Government which has generally shown itself so ready to play into the hands of Ultramontanism. But the cause is not really far to seek. For many years past the Brazilian bishops, in defiance of the professed teaching of their Church—which regards the sacrament of marriage as dependent on the consent of the parties themselves, and not on the ministry of the priest—have maintained the absolute invalidity of Protestant marriages, and consequently have treated married Protestants as living in concubinage. What sounds still more incredible, but is nevertheless true, is that some fifteen years ago they induced the State so far to sanction this monstrous claim as to insert a clause in a general Marriage Act providing that a Protestant husband or wife on joining the Church of Rome should be freed from the previous obligation of marriage, which the law under certain conditions admits between Protestants for purposes of police. There are a great number of Protestant settlers in Brazil, both German and English, and it of course followed that any of them who was tired of his wife, and carrying on an intrigue with a native woman, had only to proclaim himself a Catholic, when he could at once repudiate his wife and marry his mistress. In short, there was the convenience of a universal divorce court for all Protestants without any of the trouble or expense. But the scandal became so intolerable that the Government has now recoiled from this iniquitous position, and refuses any longer to endorse the clerical claim to have Protestant marriages treated as invalid. The bishops, however, who, if common report speaks true, might find abundant examples of concubinage nearer home, stick to their point, and it is probably with a view to simplify matters that a general enforcement of civil marriage is proposed. Be that as it may, the novel pretensions of the Roman hierarchy, acting under Vatican guidance, clearly promise to be as extravagant, and as provocative of conflict and confusion, in the New World as in the Old.

BRITISH EMIGRANTS IN BRAZIL.

THE Foreign Office has taken its time in publishing the Reports from the British officials at Rio de Janeiro on the treatment and condition of the British emigrants lately carried off by Brazilian Government agents for Brazilian Government colonies. "Enticed" is the word used by Mr. Phipps, Second Secretary of the British Legation in Brazil, whose Reports on this unpleasant subject show great industry and courage of language. "Greedily seduced" is the phrase employed by a former Brazilian Minister of Agriculture, whose wisdom and frankness appear to have been promptly rewarded by dismissal, and whose warnings have been entirely lost on Brazilian administration. The latest despatch from Rio de Janeiro published in this correspondence is dated March 11. This would have been received by the Foreign Office before the end of April; nearly three months intervene before publication. It is indeed strange that the Blue Book contains not one despatch from Earl Granville written during these three months, or earlier, giving instructions to our Minister in Brazil, or expressing an opinion on the facts submitted to him. The Brazilian Government is clearly responsible through its agents for proceedings which have involved hundreds of humble British families in ruin, and destroyed many British lives. When Lord Carnarvon brought this matter forward in the House of Lords on February 17, Lord Granville pleaded for time; our Minister in Brazil had, he said, been instructed to make inquiries, and communicate with the Brazilian Government, and he could do nothing till his Reports were received. Lord Carnarvon had moved for a copy of a letter addressed by a Warwickshire clergyman to the Foreign Office, representing the destitution and distress of a number of Warwickshire emigrants to the Brazilian colony of Cananea. Lord Granville did not doubt that, if the British Minister found the statements of the Warwickshire clergyman correct, the Brazilian Government would be glad to remedy such a state of things. Till he received the British Minister's Report, he could not produce the Warwickshire clergyman's letter, which contained attacks on individuals, or give any opinion on its statements. The British Minister's Reports are now here; the first, a very conclusive one, has been here five months, and the last, which is black as pitch, especially as to Cananea, as many as three months. Even now the Warwickshire clergyman's letter is not printed. Its statements could not have been worse than Mr. Phipps's painful details as to Cananea. The Brazilian Government has not shown any of the virtues which Lord Granville confidently expected. What is Lord Granville now going to do? Why so much delay? Except for the details

as to Cananea, Lord Granville need not have waited for Lord Carnarvon's benevolent intervention, and should long since have taken energetic measures to prevent the continuance of this deplorable Brazilian emigration. A previous Report of Mr. Phipps, dated March 1872, was in Lord Granville's hands fifteen months since, full of facts and warnings, and really as conclusive against Brazilian emigration as Mr. Phipps's two Reports, now published, of January 4 and February 17, 1873. There were many previous strong warnings from British Consuls in Brazil. Mr. Phipps recapitulates some of them; they go back in date to 1869. Complaints of wholesale deception were, Mr. Phipps tells us, addressed by British colonists to the British Legation as far back as 1868, and again in January 1870. Then came, during the autumn of last year, the heart-rending detailed accounts in our newspapers. With timely attention to many warnings, including Mr. Phipps's powerful Report of March 1872, how much mischief might not have been prevented! From May 1872 to January 1873, Mr. Phipps says, a thousand persons were despatched by the Brazilian Consul-General at Liverpool to Brazil, to find on their arrival there every expectation falsified, and to face destitution, disease, and death. Many more were expected at the date of the last despatch, March 11. Nothing worse has appeared in our newspapers as to the fate of emigrants to Paraguay than are the facts as to Brazil; but whereas we have long seen official manifestoes against Paraguayan emigration in every post-office of the United Kingdom, no similar warning against Brazilian emigration appears to this day in our post-offices. A mild warning, it is true, was issued at the instance of the Foreign Office, with a limited circulation, by the Emigration Commissioners, before the date of Lord Carnarvon's public exposure and remonstrance; but why has there been one measure for Paraguay and another for Brazil? Mr. Phipps suggests in one of his Reports now published that if, "like the previous one (that of March 1872), it be so fortunate as to meet with Earl Granville's approval," it should be circulated among Mechanics' and Labourers' Institutes and similar establishments. "Agents," he adds, "employed by the Brazilian Consul-General are, I am assured, established at Leamington and Gloucester, and doubtless in other towns of the Midland counties." This is a suggestion which it should not have been left to Mr. Phipps to make. His Reports, or summaries of them, should be forthwith sent, if it has not yet been done, to the clergyman of every parish for publication or distribution; and every post-office should make known the mischief. Lord Granville spoke of his unwillingness to offend a foreign nation with which he desired to preserve friendly relations; but the Reports now published show no sign of proper appreciation of his amiability; and complaisance to a foreign Emperor is not to be thought of when his Government has organized a scheme for exposing British agricultural labourers to misery and death.

This would seem to be clearly established by the Reports now published. A Brazilian Minister of Agriculture issues a general instruction to the Brazilian Consuls in Great Britain to engage colonists in all parts of the United Kingdom for State colonies under the direct control and administration of the Brazilian Government. A prospectus is issued by the Brazilian Consul-General in Liverpool full of erroneous representations, beginning with "good climate." Every emigrant embarks at Liverpool with a certificate signed by the Brazilian Consul-General. The Brazilian functionary employs Englishmen as agents to scour the agricultural counties, and whip up for him emigrants for the Brazilian State colonies. Three Englishmen named as such agents are Alsopp, Haynes, and Yeats. One of the handbills promises to each member of an emigrant family 2*l.* on arrival at Cananea, in Brazil, and 2*s.* a day each, together with the use of tools and everything necessary, until their first crop is gathered. Mr. Phipps's note on this is "False." Mr. Churchill in the *Vicar of Wakefield* would have been content with "Fudge." Cananea, in the province of St. Paul, and Assunguy, in the province of Paraná, are the two colonies to which British emigrants have been lately destined. The misstatements of the official prospectus and handbills as to these two colonies may be inferred from Mr. Phipps's criticisms:—

Whatever hidden treasures the province of Paraná (Assunguy) may contain, it actually possesses neither diamond, gold, nor lead mines, nor can I imagine that its possession of "bituminous earth" can be of any advantage to intending colonists. Both that substance, as well as the gold, lead, and diamonds, if secretly produced, are consumed on the spot. Except "hermatite," wheat and the other grains enumerated are not cultivated to any extent, except in the immediate neighbourhood of Curitiba, where, according to the President's last Report, they hardly repay the cultivator.

The grains and fruits of temperate climates are produced on the highlands, just as the fruits of tropical climates are produced on the lowlands, but not, of course, simultaneously in the Colony of Assunguy, which, in addition to its many assumed advantages, cannot be said to enjoy two totally different climates. Sugar, coffee, tobacco, mandioca, are its actual productions, which indicate the nature of the climate. As the prospectus states that Assunguy "commands a good port," an uneducated person would infer that the column headed "Productions" bears reference to the Colony of Assunguy, and not to the province, as it obviously does. It being distant twenty-eight leagues by road from the sea, with bad roads intervening, the port is little available for colonists, who, it will be shown, are hardly in prosperity.

Neither Cananea nor the province of San Paulo possesses either copper, silver, or gold mines, nor precious stones, nor coal mines. The province produces a large quantity of coffee, but little, if any, is exported from Cananea.

As to the regulations of the State Colonies detailed in the prospectus, in but few of those on the list are they carried out. Assunguy and Cananea, which have been in existence ten to fourteen years, possess neither squares, public pleasure grounds, churches, nor town halls, nor (see Article 3*a*) is any provision made for religious instruction. The colonists have not been "free to choose the lots they may prefer," none being (as will be seen), during the

last few months, in Cananea, marked out for occupation, or even ready. . . . The 20 milreis mentioned in Article 3*a* are, with culpable carelessness, stated to be 2*l.* 19*s.* 6*d.*, instead of 2*l.* 3*s.*

With regard to the paragraphs at the foot of the handbill, the intending emigrant should be aware that in the Colony of Cananea labourers on the public roads are paid 1 milreis 600 reis. (about 3*s.* 6*d.*) for a day's labour of twelve to fourteen hours; at Assunguy the rate of payment, according to the President's Report, is reduced to 1 milreis, or 2*s.* 2*d.*

The living at the Colonies, which is stated to consist of "beef, mutton, veal, lamb, pork, fowls, ducks, potatoes, and various kinds of vegetables," really consists of "carne secca," pork (fresh or salted), mandioca, flour, black beans, &c. Beef (except in large towns, or in the south) is rarely, if ever, tasted by the common labourer.

The Colony of Cananea, situated in the province of San Paulo, on low land, about fifteen miles from the port of that name, is the State Colony to which the largest number of British subjects have been sent; but respecting which the most serious complaints have been continually made by the colonists. Though the truth of these complaints has been often admitted by the Government officials, the colonists engaged by the agents in Europe are still sent to this ill-situated and badly-managed settlement.

Many of the poor people despatched last year arrived at Rio de Janeiro, and many more were expected to arrive there, while yellow fever was raging—a pleasant beginning of "good climate." These were intended for Assunguy, Paraná; and as to what was in store for them before they got to Assunguy, and when they got there, Mr. Phipps writes:—

As a proof of the reckless manner in which this scheme has been carried out, I must add that the Agent for Colonization, who is not, however, as his name would indicate, the Agent actually responsible for the organization of the State Colonies, had admitted to me that they are not to be sent to a State Colony direct, but to the port of Antonina, in the Province of Paraná, whence they will proceed to the town of Curitiba, the capital, situated fifty miles from the sea coast. This distance they would have to travel on foot, carts, it was expected, being provided for the women and children. At Curitiba they will have to remain several weeks without work, no arrangements whatever being yet made for their reception at the Colony of Assunguy, situated again forty miles over either bad or incomplete roads from Curitiba. The preparations at Assunguy were, he said, however, in progress.

Already 312 colonists from England, who arrived at the end of December and the beginning of January by the steamer *Edinburgh Castle*, have been sent on to Curitiba, where they are waiting, without regular work, until the Colony is ready for them, though some few might, it was hoped, be employed in the construction of roads. As to the present proposed expedition, I was informed that directions had simply been sent to the President of Paraná to receive them, and to expend any money at his disposal.

I could not imagine anything more likely to unsettle these persons, and utterly unfit them for the difficulties with which all immigrants must contend in a strange country, than the various changes they will have undergone before arriving at their final destination.

And now for those sent to Cananea. Some had been sent there in July 1872, others in December. The remnants of these two batches whom death had spared fled at the end of January; and Mr. Phipps reports on seeing them near Rio de Janeiro:—

Their story may be related in a few words as follows:—From the time of their arrival on the 5th July, until their departure (towards the end of January, but few of them were placed on land, few if any lots being ready for them. Instead of the organization which a perusal of the prospectus induced them to believe they would find, there was nothing but disorder. Several of them took possession of lots, and were anxious to work, but had ultimately to labour on the roads to earn ready money, thirteen hours per day being the hours for work. None received the promised bonus. The inclosed Table, which I have drawn up, shows the amount they earned both in England before starting, and, as they declare, during their whole residence in Brazil, and also the amount of sickness which prevailed, but few escaping the smallpox, and a low fever, which would seem to have been epidemic at Cananea, brought on by damp and the change of food. The ordinary food of the country was, it will be seen, somewhat irregularly applied to them in most cases, and but few necessary comforts, which might have saved many lives. As far as I can ascertain, about twenty out of the 113 died.

In December the other party arrived. They found little to encourage them; no arrangements for their reception, inferior, and as they declare insufficient, food, and no comforts for the sick. They remained only twenty-four days, but no less than thirty out of the 245 died, in addition to two infants, who have died since their return.

The appearance of the whole body of emigrants was melancholy in the extreme. Most of them bore traces of the infectious disorders they had contracted, or were much attenuated. The children were, nearly all of them, covered with eruptions or scabs. Thirty-six out of the 266 were in hospital, with fevers, more or less serious; and many children with smallpox, not however of a severe nature. It was the exception to find a family of which some member had not died.

Mr. Mathew, the British Minister, wrote on January 31 a strong letter of remonstrance to Viscount Caravellas, the Brazilian Minister for Foreign Affairs. The case is indeed an urgent one. Having received no answer by February 13, Mr. Mathew writes again; and on February 27 he at last receives a reply. The Minister for Foreign Affairs had been waiting for the Minister of Agriculture, who had been delayed by "the necessity of obtaining explanations and correct information." The unsatisfactory nature of this tardy report of the Minister of Agriculture may be judged by some extracts from Mr. Mathew's spirited rejoinder:—

I will frankly confess to your Excellency that I have perused the note of the Minister of Agriculture with some surprise and with sincere regret.

A reference to his archives for the last four years will prove to his Excellency how frequent have been complaints of British emigrants.

The language used by the Minister of Agriculture, respecting the unfortunate immigrants who had been sent to Mendez on their recent return from the Colony of Cananea, leads me to assume, in justice to his Excellency, that the account given in the public papers by the Government Agent of their deplorable condition, and the sworn depositions of several of the most intelligent among them, taken in the presence of the Government functionaries who strictly questioned them, have been withheld from his cognizance.

I think that it could hardly be expected, or desired, that these poor people should have waited further decimation at Cananea, until the preparations for their advantage, which his Excellency the Minister for Agriculture states were being "actively" carried on here, should have afforded them relief.

Nor can I consider that they are justly liable to the accusation brought against them by his Excellency of "want of perseverance to overcome certain difficulties which naturally occur during the first moment of settling in the Colonial centres."

In this sad case the plain truth appears to be, that the immigrants were attracted by false, or very exaggerated, statements of advantage,—difficult, if not impossible to realize; that they were most improperly sent out at a season which is always trying to European constitutions, but which this year (as unfortunately occasionally occurs) has been marked by a serious epidemic,—and that neither at Rio de Janeiro nor in any of the Colonies had any sort or kind of preparation been made to receive them.

But, M. le Ministre, there is another point which cannot be passed over. The honour and the interests of Brazil demand that the public in England, as in this Empire, should know that this person or persons by whose incapacity, ill-will, or negligence this disastrous occurrence has taken place, have not escaped reprobation.

It is evident from the public acknowledgment of despatches received, that the Ministry of Agriculture had full and ample notice of the arrival of each batch of emigrants, and his Excellency the Minister will best know if I am mistaken in the belief, that the Directors of one, if not of more, of the Colonies had distinctly informed the Minister that they had no facilities at the time for the reception of further immigrants, and if the Ministry was not urgently warned from other quarters of the necessity of making suitable arrangements for the number expected.

Lord Granville's kind and amiable disposition will hardly enable him to retain a belief that the Brazilian Government will be glad to do what it can in the way of redress; for it is now redress, rather than remedy, that is urgent. The dead cannot be recalled to life, nor can shattered health be re-established; much that is past is irremediable. It behoves the Brazilian Government to lose no time and spare no expense in restoring to their homes these poor families whom they have imported, with liberal compensation for their injuries and losses. If the agents of the Brazilian Government have transgressed instructions, they should be punished. Does the Brazilian Government take on itself the responsibility of the proceedings of the Consul-General at Liverpool? It occurs to us that further Reports from the British Legation must have already reached the Foreign Office since the date of March 11. Lord Granville's own correspondence on the conduct of the Brazilian Government against British subjects will be looked for with anxiety, and with the hope, until the contrary is proved, that he has fully estimated the comparative values of British life and duty to British subjects, and of the sensibilities of a foreign nation careless of international comity and duty. One thing should be done without delay. A warning manifesto on this Brazilian scandal of emigration should appear forthwith in every post-office of the kingdom; for it would be a great mistake to repose too much confidence in Brazilian promises of cessation.

THE SCARCITY OF HORSES.

MUCH useful information was collected by the Lords' Committee upon Horses. As regards cart-horses the price has risen to a point which must stimulate breeding, and it is agreed that the stock for breeding exists. As regards horses for riding and driving, the price has also risen very considerably; but it is feared that some years must elapse before the existing demand can be satisfactorily supplied. Witnesses from various parts of the country testify with striking unanimity to the perseverance of foreign dealers in searching out and carrying away likely mares. Circumstances, it was said, disinclined the farmer from breeding, and a good price tempted him to part with the means of taking to it again. Horses for cavalry and artillery can only be had, like horses for other purposes, by paying for them; and the best way of stimulating production would be to offer a certainly remunerative market to the breeder. Other palliatives may be proposed for the existing evil of short supply; but this is the only simple and sure remedy.

The most recent information on this subject is the best, and therefore we will turn to the account given by Sir Henry Storks to the Committee on the 16th of June of his purchases of horses for the autumn manoeuvres now being held. He had bought at that day 560 horses, and he intended to buy in all 800. Of this number, 100 for riding had been bought in England, and 700 for draught had been or would be bought abroad. Mr. East, a dealer employed by the Government, had been to all the fairs, and he had been able to pick up very few English horses, and those of a bad description. Thus foreign horses were bought from absolute necessity. The price per horse has been 47*l.*, being an advance of 5*l.* upon last year. English horses could only have been obtained at a much higher figure. The animals purchased are almost all mares, and some of them will be very good for breeding. They are Normandy horses, heavy but active, such as we used to see formerly in the diligences. The witness thinks that they will do slow work quite as well as English horses. The loss upon each horse when they shall be sold after the manoeuvres may be taken on last year's experience at 20*l.* The same class of French horses has been largely purchased by the London Omnibus Company. The Secretary of that Company considers that the cause of the scarcity which has been lately felt is the enormous export that took place in consequence of the war. Up to the time of the war breaking out there was an over-abundance of horses in England, and no difficulty in getting whatever the Company required, but at that time the French dealers came over and bought up everything they could lay hold of. The Company was driven to buying foreign horses, "simply because they could not get English." It is not, says the Secretary, an affair of price so much as an affair of absolute scarcity. "I do not think that you can get them at all in England in any quantity. Certainly we could not afford to buy

them." This is a gloomy picture of the present condition of things, which has been produced first by discouragement to breeding, and then by extraordinary demand. Some breeds of horses have become unfashionable and then almost extinct. This happened to the big bay coach-horses called *Cleavelands*. About 1841 a new fashion in horses came up. A horse of blood was wanted with a fine high-stepping action. The price of *Cleavelands* fell from 120*l.* to 50*l.* "That," says a witness, "knocked on the head all that class of horses, and we lost the breed of them, the foreigners got all the good mares." This evidence is given by a man who has led a stallion for thirty-six years in Yorkshire. The next discouragement was the railways. The farmers told the witness "We have nothing at all for you this time, the railways will stop all the trade." It is quite credible that farmers may have thought that railways would supersede horses, although they have in the result largely increased the demand for them. If the farmers were deterred from breeding, the foreigner was ready at any moment to buy their mares. For the last thirty years French and German dealers have watched every opportunity of advantageous purchase. The Crimean war helped the farmers a little, but afterwards they lost the trade again and the prices went down. After that almost all farmers began to give up breeding, and so things went on until the last eight years, when they began to improve a little, and they are improving still. "The horses would not have been so very scarce at this day if the French war had not come up, and now the Government have swept the country, and there are no horses to be had at all."

This picture of the fluctuations of horse-breeding in Yorkshire suggests that some element of stability is much needed in it. Our military policy has always treated both men and horses in the same way. Extravagance has alternated with parsimony. In order to reduce estimates we suspend purchases of horses; this discourages breeding, and when need arises it can only be supplied at heavy cost. Of all methods of encouraging breeders, that of buying their produce regularly is the most certain, and perhaps in the long run the cheapest. We greatly doubt whether any other method is open to the Government; but the perusal of this Report confirms the opinion we have before expressed, that a great public service may be rendered by any nobleman or gentleman who will place a sound and useful stallion at the disposal of his tenants and neighbours. A small part of the money spent in horse-racing would suffice to encourage the breed of those classes of horses in which at present the country is seriously deficient. Much has already been done in this direction, and the examples of Lord Charlemont in Ireland and of Lords Combermere and Falmouth in England cannot be too widely imitated by the aristocracy either of birth or wealth. Whatever unpopularity may be incurred by preserving game, a landowner may more than counterbalance it by promoting the breeding of useful horses. A man of wealth is independent of those fluctuations of the market which deter the tenant-farmer from breeding horses. On a series of years he probably would not lose, and he might be sure at any rate that the country would gain. It used to be said that one of the chief duties of a landowner was to plant acorns, and the same may now be said of getting likely mares in foal. Lord Charlemont says:—"It is only since I kept stallions myself that the farmers in the neighbourhood are breeding, and now they are breeding rather largely." He says of a certain district in Ireland, "It was a very large district for army purchase, but the price does not tempt the farmers now." There has been such an enormous number of horses taken out of the country for the last three years that the farmers cannot afford to sell at the army price. The Belgian army has been horsed for years from Ireland. "Everything has affected the horse market; the rise in prices in everything, and the demand beyond supply." There has been a decrease, but now breeding is getting up again considerably. Lord Charlemont does not think that horses in Ireland have deteriorated, but "our good horses are taken away before they have grown into their proper form." Lord Combermere thinks that if Government would do one thing, it would encourage breeding more than anything else; and that would be to increase the price of troop horses, say, to 50*l.* or 60*l.* That would induce a great many people to breed who do not now breed. "If Government gave a fair price, it would stop a great many horses going out of the country, and in the long run be a saving to the country." We are inclined to agree with this opinion of Lord Combermere, but of course the economists would not listen to him for a moment. It was, we suppose, consistent with economy that the horses employed for the autumn manoeuvres of last year were sold at an average loss of 16*l.*, and that horses have been bought for this year's manoeuvres at an advance of 5*l.* A London jobmaster cannot venture to run any risk of being unprovided when the season begins, and Mr. East told the Committee that on the 10th of March he had three hundred horses lying by and not earning a shilling, "in order that we may have them by us when we want them in May and June." He says that people in London would like to have their own horses if they could, "but we generally find that they break down in it as a rule." Many readers will easily own the truth of Mr. East's statement. He objects strongly to foreign horses for London work, and thinks the Mecklenburgers worst of all. Mr. Phillips told the Committee that the Yorkshire farmers have sold off their mares; "there are literally none left." As regards mares, the English buyer is beaten in the open market by the foreign buyer. "The foreigners considered our breed the best in the world, and they came here for them." These witnesses accurately state the result of their own experience

and observation, but it is of course possible that they may generalize too hastily. We can hardly, however, attach too much weight to such a remark as this of Mr. Phillips as to getting together two or three thousand artillery horses within three months. "It is not a question of money; it is a question of not having the animals." He believes that every farmer who farms over two hundred acres of land is short of horses. If we became involved in a war which closed Continental sources of supply, and if at the same time we had to send an army, say, to Belgium, we could not, under present circumstances, find the necessary horses.

If this is a correct statement of our position, a remedy must be applied to it, and any effectual remedy must cost money. Talk about the law of warranty and the horse-dealer's tax, and prizes for stallions at agricultural shows, is all very well as far as it goes, but it does not go far enough. The arguments which induce us to build ships of war are equally cogent for buying or breeding horses. Let money be spent in the best way, but spend it. The French Government has lately recognized the truth that suitable horses for military purposes can only be had by paying for them. The French farmers, like the English farmers, find it more to their advantage to breed cattle than to breed horses. The French Government have come to the conclusion that it is their duty to induce the farmers to breed horses as well as cattle, and they have augmented the price which they offer by one-third. Our Government will be forced, however reluctantly, to do the same. Mr. Phillips urges the importance of choosing our stallions well, because we have only those mares left which the forgers did not think good enough to take away. The idea of prohibiting the further exportation of mares could not be seriously entertained. Mr. Phillips said that if we stopped our mares, France would stop her horses, and then "you may shut up your autumn manoeuvres." Mr. Phillips recommends that the cavalry and artillery should buy their horses at three years old, and keep them for a year or more before putting them into regular work; and he thinks that the artillery, having by this plan supernumerary horses, might supply two thousand of their least efficient horses for the transport of the autumn manoeuvres. This, he thinks, would be better than coming to him and saying, "Now we want two thousand horses in two months, and you must strain every nerve to get them." As regards the cost of this plan, it must be remembered that one thousand nine hundred horses were sold after last year's manoeuvres at a loss of 16*l.* a piece, which represents upwards of 30,000*l.* In one respect the Government are gainers, for their cavalry horses, as well as those of the Railway Companies, fetch higher prices than they used to do. Even the knackers pay 10*s.* more per carcass than formerly. A witness puts it that five men want to buy six horses, and there are only four for them in the market. He finds that in his business of broker he has to pay 20*l.* more for horses than he paid twelve months ago. Clearly the Government must submit to a similar advance. It is strange, but true, that horses are so dear because they have been so cheap. This country, after supplying all the Continent with horses, now finds herself destitute. But prudence and patriotism may in a few years recover our position. Only we must make up our minds to spend more money upon horses for our army.

THE GAOL CAMERA.

THE presentation of a portrait is a familiar form of public gratitude. Sometimes the picture is presented to the person who is therein commemorated, and sometimes it is placed in a public repository for the delight and edification of posterity. The latter course is that which has been adopted with a collection of portraits of celebrated characters which is now being formed under the auspices of the Home Secretary. It may be said that there are two things which nowadays make their way everywhere—art and local rating. It appears that art has become an important element in the police system of the country, and, as usual, the expense is thrown on the local rates. Under the Habitual Criminals Act of 1870 directions were given that a register should be kept of all convicted prisoners, and that means should be provided for identifying them—in other words, that they should be photographed. The photographs were to be deposited at Scotland Yard. A sort of Walkhall of criminal celebrities has thus been established; but it is not exactly known with what feelings this distinction is regarded by the class upon whom it has been conferred. We have some recollection of reading that when the practice of photographing criminals first came into operation it was in some instances rather violently resisted, but this may have been from modesty and a retiring disposition. There is obviously not much use in taking photographs of a gentleman who bobs his head madly up and down, and hideously distorts his features. A Parliamentary Return has just been issued, in which no mention is made of any difficulties of this kind, and perhaps the shyness of habitual criminals may have been overcome by the reflection that it would be a pity to be handed down to posterity as uglier than they really are. A great man once insisted that his portrait must contain all the warts and wrinkles on his face; but greatness and personal vanity are not invariably dissociated. It should be explained that it is not exactly public gratitude which has produced this anxiety to obtain memorials of the heroes and heroines in question. The object is to assist the police in identifying them if they should happen to resume their professional labours. We learn from this return that down to the end of last year 43,634 persons have been

photographed at a cost of 3,000*l.* The local-rating camel is already so overburdened that the tiniest straw may break its back; but in this case there is at least reason to believe that, if the police expenses are increased in one way, the effect will be to reduce them in another. It is of course too soon as yet to estimate the full results of the system; that can only be done after it has been for a longer period in operation.

The prison authorities report that, as far as they know, the photographs have led to the detection of criminals in 156 cases, and the Metropolitan Police give 373 cases of detection, which perhaps include some of the former. This is, no doubt, a small proportion of detections out of such a large number of criminals; but it does not follow that the practice is useless. It is possible that one reason why there have not been more detections is simply because criminals, knowing the chances of being identified, are afraid to go back to their old habits. Moreover, the value of this portrait gallery is not exhausted. It will continue to be serviceable for the identification of offenders in future years. The number of cases of detection by this means must necessarily be very much a matter of accident. Of 103 county prisoners at Bedford, 20 have been detected; but only one at Reading out of 270 prisoners, and none at Chester out of 266. At Dorchester there were six cases out of 178, but the Justice adds that it is impossible to say in how many more instances the photographs may have indirectly had this effect. The Holloway Gaol Committee similarly remark that it is quite out of their power to say in how many cases the photographs have led to detection, but they mention that about thirty of the whole number of prisoners have since come under their observation and have been punished for fresh offences. "Not known" is the answer given by a majority of prisons, and it may be assumed that when the answer is "None," it means pretty much the same thing. The truth is that it is by no means easy to trace the effects of such a system. It may be presumed that the police do not neglect to study this interesting collection of portraits, but they may not be able in each case to say how much they owe to the photographs. From some of the prisons the reply is "No record kept"; but, though the record can hardly be otherwise than imperfect, an attempt should at least be made to keep one. The cost of photographing prisoners varies a good deal. In some cases we find that the governor of the gaol takes charge of the camera as a labour of love. Liverpool has spent 95*l.* in fitting up a photographic studio, and pays 60*l.* a year to a regular artist to attend there; and studios have also been provided in other gaols.

It is to be hoped that the practice of placing prisoners under the lens has not altogether superseded the old fashion of making them "sit for their portrait" under the eyes of warders and constables, so that the latter may take a mental impression of the face and figure of each sinner. Readers of *Dickens* will recollect how the venerable hero of the romance underwent this ordeal on his incarceration in the Fleet, and found it rather trying to his philosophical composure. It is one thing to photograph a face, and it is another thing to recognize a face from a photograph. The most absurd and erroneous impressions of physiognomy, and especially of stature and complexion, are frequently conveyed by photographs. Everybody knows the dull, hard, constrained expression which is frequently met with in the family album. A cheerful uncle is made to wear an aspect of gloomy ferocity, while the timid maiden aunt displays the brazen determination of a reckless Amazon. The blonde angel is transformed into a dusky demon, and hair of the most blazing red is darkened into jet. We have soon a little fellow of five feet nothing come out in his *carte* a stalwart giant of six feet two. As for the relative size of head, hands, and feet, nothing can be more grotesque than the tricks which are sometimes played by the camera in the hands of an artist who has not mastered the mysteries of focus. It may be assumed that there is always a certain likeness in a photograph, but it is often a likeness of quite an unexpected kind. We should say that the most common experience on seeing any one with whose photograph you were previously familiar is a feeling of surprise that the original should be so like the photograph, and yet so different from what you imagined him to be. His likeness really was in the photograph, only you were led away on a false scent by some exaggerated feature or unnatural shadow, and formed a false impression of his looks and bearing. And of all people the criminal classes are the most difficult to photograph. The ordinary run of prisoners have a strange resemblance to each other. They seem to have nearly all much the same mean, common, doughy sort of face, weak and flabby, and the same small, restless eyes, and air of vacant imbecility. It is the rarest thing in the world to see a manly or intelligent face among them, or indeed a face with a strongly marked character of any kind. They are mostly soft, silly people, marked by self-indulgence and a sort of weak, inconsiderate impulsiveness that leads them, when they come across a thing they want, to snatch at it. There is hardly any class who have, to all appearance, so little of their wits about them; and a considerable proportion of the habitual criminals may almost be described as semi-idiotic. We are by no means desirous of founding upon this any plea for the exemption of this class from punishment, because, however feeble and imperfect may be their intelligence, they have at least enough of it to know very well that it is not pleasant to be punished, and they are so far under a certain amount of self-control. Still the fact may be taken for what it is worth. It will readily be imagined that people of this stamp do not come out very well in photographs. A policeman accustomed to see a great many copies of the same type of face is often

puzzled to distinguish one from another, even when standing in the flesh before him, and he is still more puzzled when looking at their blank, lifeless portraits. Under these circumstances, the photographs themselves may in some degree help to account for the comparatively small number of detections to which they have led. This is peculiarly a case in which what is worth doing is worth doing well, and an improvement in the style of portraiture may be expected to follow as a result of experience.

It would appear that at present this interesting collection of portraits is used simply for ordinary police purposes. The policemen and warders look over the pictures, and try to pick out faces which they wish to identify. The next step will perhaps be to subject the gallery to scientific analysis and classification. It has before been observed that murderers have a wonderful family resemblance. The thick neck, heavy jaw, and low, retreating forehead are significantly repeated, though of course now and then a character of an entirely different kind appears in this class. The common thief is distinguished rather by his weak chin and narrow forehead than by any indications of exceptional brutality. Thieves may be divided roughly into four classes—the casual, the habitual, the petty, and the grand. The casual thief yields under the pressure of strong temptation or exceptional distress; the habitual one has had his natural propensities confirmed and intensified by the influence of circumstances, and it is as difficult to remove him from the latter as to change the former. The petty thief, except when of the casual kind, has usually a very unprepossessing look; but here comes in the distinction between the petty and the great rogue. It is not a natural progress of development from the petty to the great. Occasionally, no doubt, the petty may rise into the great, but as a rule the great are a class apart from and unlike the common race of scoundrels. This is a point on which novelists are strangely apt to go wrong. Even Dickens, who began life as a reporter at the Old Bailey, and had studied criminals in all their phases more than most men, generally makes the mistake of giving his villains a vicious and repulsive aspect. It does not require either much shrewdness or observation to see that a marked and obvious villain, a villain with the placard of villainy on his brow, would, in the nature of things, find but indifferent scope for the perpetration of his villainies, for the simple reason that he would be known for what he was, and everybody would be on their guard against him. Indeed we have sometimes been driven to think that a really hang-dog face may be highly conducive to the practice of virtue, no alternative almost being left. But the peculiarity of the big swindler, and it is a characteristic which helps to explain his career, is his candid and benevolent appearance. This is the familiar type of Bank thief and City swindler, and here, again, the reason is that it is his candour and benignity which are, as it were, the jenny and crowbar of his trade. But for these he could not make his way. They win him trust, and it is the trust reposed in him which opens up his opportunities of plunder. This is the weak point of physiognomy as an aid to the detection of crime. Except in the lower grade of roguery and scoundrelism, the really ill-looking people have not much chance. When we consider the personal looks of a good many of the members who came into the House of Commons at the last general election, it would obviously be dangerous to trust too much to appearances as a clue to criminal character.

ART AT THE VIENNA EXHIBITION.

II.

THERE is a danger that the mismanagement which has all along marked the administration of the Vienna Exhibition may prevent the fair appreciation of the incontestable merits of the works displayed. It is moreover to be feared that few persons will have the courage or the strength so to compass the vast collection as to carry away any clear idea of the comparative position held by each nation. In the department, however, of the Fine Arts, clearness has in some good degree been secured by the appropriation of separate buildings to different countries; though even here one nation frequently invades the territories of neighbouring nations. The student is also met by the serious difficulty of multitudinous Catalogues which often impede rather than facilitate his progress; our table already groans under the weight of about a dozen of these ponderous, prosaic, yet inaccurate productions, and as many more must be added to make the collection complete. Indeed the "Ausstellungen-Literatur" has swollen into a goodly library, and the topics discussed are so varied as to form a Cyclopædia of useful and entertaining knowledge. The visitor has the privilege of purchasing at stalls conveniently placed within the building a volume on the cultivation of the vine, a treatise on the production of beer, "an essay on sea-sickness," &c. And our complaint is that, after all, we cannot get within the special division of the Fine Arts what we want; we are driven from Catalogue to Catalogue, and the discrepancies in numbers, names, and descriptions have in the end to be set right in manuscript. We are happy to add that we have been repaid for our trouble, and we shall now proceed to show wherein lie the surpassing riches of these ample galleries, corridors, and porticoes.

The German Empire puts forth its collective force in an aggregate of 753 pictures which occupy four large galleries, and eight corresponding small side rooms—space only equalled by the

large area filled by France. Indeed it is between France and Northern Germany that the competition for the foremost rank lies; the two nations here measure their strength in the arts as they have recently done on the battle field—with this difference, however, as to the issue of the conflict, that new Germany is defeated. And yet we have never seen, except perhaps in Munich four years ago, so strong an array of the German forces. But though it may be for the glory of the Fatherland that artists hitherto scattered among separate and minor States should now be concentrated under one Empire, yet the instructive comparisons which in the former condition of things could be instituted between distinctive schools, such as those of Düsseldorf and of Munich, become now, under a blended national unity, difficult and all but impossible. We may venture, however, to state that the several Academic centres long known in Exhibitions appear on the present occasion in relative importance in the following order. Between Munich and Düsseldorf there is a close run for the lead; Munich has had in her favour proximity of position, and the number, magnitude, and importance of her contributions are proportionately great, though in the absence of Director Kaulbach she suffers a loss for which even the presence of Professor Piloty does not quite compensate. Berlin follows next, producing as her credential a noble historic work by Professor Richter, who now for the first time worthily asserts in an international contest the position to which he is known to be entitled. Among minor States, Weimar gives proof of the possession of a well-appointed Academy; Carlsruhe and Stuttgart also produce works which attest activity and talent. Dresden is exceptionally barren; even Professor Hubner does not deign to give any pledge of his historic talent; but possibly his reputation would have gained little by the ambitious composition which within recent years has obtained a place in the Gallery which boasts of the masterpieces of Raffaele, Holbein, and Correggio. Dresden is in decadence. After a careful survey of the contents of these German Galleries, we again come to the conclusion that there is a deep and unbroken stratum underlying the whole German Empire. For the moment there appear on the surface differences in formation which may for a time divide Munich from Düsseldorf, or Berlin from Vienna; but such distinctions are usually found to be but the accidents resulting from the residence of some man of commanding talent such as that of Professor Piloty in Munich. German art essentially remains German for ever; it is serious, solemn, and studious even to a fault; it lacks spontaneity. Compared with Italian art—old as well as modern—it is denied the sense of beauty; indeed we have sometimes thought that the true vocation of professors in Germany has been to teach and to illustrate the philosophy of ugliness. In Vienna the contrast between Germany and France is just as great as might be anticipated from the differences of national character. In a German picture we can always smell tobacco and beer, without the promise of champagne; and yet we are expected to worship as in the presence of the gods. The French, on the contrary, are without a creed; they seldom presume to teach, and profundity and philosophy they hold in abhorrence. A French artist is content to be artistic and nothing more. Such are the conclusions which once again the Vienna Exhibition serves to confirm.

The noblest work in the whole Exhibition is undoubtedly "The Triumph of Germanicus," a picture nearly thirty feet long, the figures above life size, the style such as might be expected from its predecessor, seen in London in 1862—Nero walking amid the ruins of Rome. Professor Piloty has again chosen a grand subject, which he treats grandly; nothing is wanting that Academic drawing, balanced colour and composition, concentrated light and shade, can give. The scene is laid in the streets of Imperial Rome; on either side rise majestic palaces, and in the midst comes in triumph Germanicus, greeted with loud acclamation. But it is neither the general nor the Emperor that attracts the universal gaze; the German captive Thunelda, of queenly dignity and beauty, leading by the hand her little son, and followed by a company of maidens, stands as the heroine of the story. Still nearer to the spectator is seen a white-bearded bard goaded by jeering soldiery, and in the foreground an old harper hand-bond has sunk in weariness. This elaborate composition, executed under commission from the town of Munich, has to our knowledge cost the artist the labour of four years, and even now we could desire more work in some of the subordinate passages. Next in importance ranks Professor Richter's florid, but well-studied, composition, "The Building of an Egyptian Pyramid." The moment chosen for this well-known picture is when the King and the Queen have come to see the progress of the works; in the foreground swarthy Nubians drag along a massive block of stone, and the Pyramid, which already rises high into the sky, is crowded with busy labourers. The picture, which barely escapes extravagance, not only in colour, but even in the forms and in the lines, may be taken as a sign of the times. "The Departure of the Jews from their Captivity in Babylon," the largest easel work we have yet seen by the fresco-painter, Professor Bendemann, the Director of the Düsseldorf Academy, already belongs to the past. The colour could hardly be worse, the forms are hard, the composition is confused, the action, especially in the foreground, where the figures tear passion to tatters, is spasmodic. This learned art claims as its merit the charm of being disagreeable; it has had its day, and may now claim respectable burial. In its place, at present, reigns the school wherein Piloty and Richter are leaders, a school that believes painting to be not a dry didactic, but a

pleasure-giving art. This new phase, unlike its obsolete predecessor, is triumphant in colour, bold in surface texture, assailing in dramatic action, scenic in contrast of light and shade. The new school and the old school, as seen in the Exhibition and elsewhere, possess only one point in common; both place equal faith in a noble type of humanity, in both alike resides the love of beauty. In Germany even *genre* painting tends to the generic, and naturalism represents not only the individual but the species.

The painters of *genre* are a legion; even history is treated as an episode in domestic life. We have marked no less than forty artists who give themselves habitually to small incidents within the family circle. The chief among them have been long familiar in Exhibitions. Professor Knaus, Professor Jordan, Professor Vautier, Herr Salentin, all of Düsseldorf, Professor Rumberg, and Herr Schmidt, both in Munich, with a host besides distributed over all the chief art centres, produce works of as high an order as is permitted to this comparatively low sphere. Professor Knaus—strange to say, all but unknown to the omniscience of England—is a phenomenon and a genius no less remarkable in his own peculiar way than M. Meissonnier and M. Cabanel in Paris. We have watched the career of this artist over a space of twenty years, and we yet marvel at his infinite variety. In Vienna he is scarcely at his best; still unapproachably clever in character is "The Funeral." Down the steep stairs of a humble dwelling is borne the coffin of a young girl; the father is so stricken with sorrow that he totters in his steps, and is ready to fall; in the courtyard below, white with snow, are assembled the children of a village school, who sing a hymn ere their playmate is carried from their sight. Professor Knaus is best known for broad humour; he is one of the very few German artists who venture to laugh upon canvas; yet no man can be more pathetic; so true it is that, to the versatility of genius, tears are akin to laughter, and comedy is but the byplay to tragedy. German artists here again show themselves solemn to a fault; the most trivial incident is dealt with as a problem in the profoundest philosophy. These painters dread daylight as a certain personage is said to fear holy water; they seldom study in the sun; in fact, they are most at home in a dark interior, and, in default of a better expedient, they will force up a figure by a black cloud expressly hung in the sky for the purpose; their colour is habitually muddy and of the earth earthy. Thus these German *genre* painters would appear to be first cousins of certain artists in the Scotch school. We must not forget to mention Herr Max as one of the most singular of the phenomena now presented by European art. His pictures are as the imagination of a mind which dreams and sleeps and then awakes to madness. A moonlight pallor is the complexion of his creations; the spell of reverie and of enchantment possesses his figures; his "Walgurnisnacht" is near to the world of spirits and of shadows.

The Germans are already hard at work on the recent war, but their painters are not worthy of their soldiers; a French artist would know how to glorify a defeat, while a German painter is sure to mar a victory. In like manner German portrait painters are more happy in their subjects than in their modes of treatment; they cut out a head keenly as a mason would carve an effigy in red sandstone, and the crude colour of the flesh is usually set off by some assailing complementary tone in the background. And yet the great men of the nation, such as Bismarck, Moltke, and Humboldt, cannot complain of ill treatment. Never have we seen a better studied portrait than that by Professor Heyden, in Berlin, of General von Moltke in his "Arbeitszimmer" at Versailles.

Landscape painting is now the rage in Germany; not even *genre* has so many followers; we have made no less than no less than sixty artists who are industriously devoting their lives to the study of nature. Professors Achenbach and Leu in Düsseldorf, Director Lessing of Karlsruhe, better known in figure painting as the champion of Protestantism, Herr Lier in Munich, have been, and still are, the leaders. A change is coming over the complexion of German landscape art, analogous to the transition in figure painting from the stilted historic to the simple domestic. The time has been when a German painter would think himself nowhere if he did not invade nine-tenths of his sky with snow mountains, the remaining one-tenth being reserved for a thunder-storm. But now more placid moods have come. The change is most marked in the simple-minded studies of Herr Lier of Munich. In the place of a mountain, we now wander and wonder over a low horizon; instead of a grand lake, we are invited to wade knee-deep through a sedgy swamp; and in lieu of purple and gold, not to mention emphatic black, we may be supposed to find supreme delight in the most harmless of greys. The secret of this new system is to make much out of nothing. German landscape is now approaching French landscape, but no German has yet come near to M. Corot.

We cannot close without a brief tribute to the earnest, unwearied devotion with which art is pursued in Germany. In no other land are found so many Galleries, Academies, or Professors. While in France little is heard of art beyond Paris, in Germany there are at least fifty towns possessing the needful appliances for the art education of the people. In fact, the study of art has become one of the serious avocations of life; the training is systematic and long-sustained; the work is so unabating that a German painter might, with Michael Angelo, make it his boast that he owed nothing to genius, but all to labour. German art, indeed, is laborious even to excess. These galleries, we repeat, prove that it is the special privilege of the school to be sedate and solemn. German art is dark, draped, and decent; the nudities common

to the French have here little attraction for professors, pupils, or the public. The great fault of this national art may be said to be that it is pedantic, prosaic, and ponderous. A German painter might fitly have for his epitaph the words, "Lie heavy on him, earth, for he laid many a heavy load on thee."

REVIEWS.

PICOT'S HISTORY OF THE STATES-GENERAL.*

THE privileges of the States-General, said Macaulay with characteristic vigour of expression, are to a Frenchman of the present day a matter of as little practical importance as the constitution of the Jewish Sanhedrim or of the Amphictyonic Council. True as this is, it need not therefore be inferred that Frenchmen are as little interested in the doings of their ancestors as they are in those of Jews and Greeks. The chasm of the great Revolution is wide, but it is the same nation that is seen on the far as on the near side of it, and the history of the France of the old régime should have something more than a mere archaic interest for the citizens of the newest Republic. This view accords with that taken by the author of the laborious and exhaustive work now before us. M. Picot passes equal condemnation upon those of his countrymen who, holding that France sprang to life in 1789, disdain to pay attention to aught of earlier date, and upon those who, believing on the contrary that France perished in the Revolution, fail to see how in that mighty change were fulfilled the desires and aspirations of many past generations—opposite schools resembling each other in nothing but in "their common ignorance of history." M. Picot's researches owe their origin to the *Académie des sciences morales et politiques*, which six years back gave as a subject for competitive essays the "États-Généraux de France considérés au point de vue de leur influence positive sur le gouvernement," and in 1870 bestowed its approval upon his work. The interest of the subject, so the author contends, increases rather than diminishes in the midst of public agitations:—

La France n'avait-elle jamais essayé sérieusement de se gouverner elle-même? Était-ce aux circonstances ou à un défaut de nature qu'on devait attribuer ses tardifs efforts vers un gouvernement libre? Ces tentatives elles-mêmes étaient-elles aussi éphémères que l'histoire nous les a peintes? Ont-elles été rattachées entre elles par quelque lien? Dans leurs aspirations généreuses, nos pères ont-ils été aux échos de cette imagination que nos ennemis semblent tenir pour notre unique vertu, ou bien ont-ils montré un peu de cette persévérance qui seule donne le succès aux nations comme aux hommes?

Posée dans ces termes, la question offrait un champ trop vaste et une application trop directe pour demeurer une pure question d'érudition. Il y a dans l'apparente diversité de nos révolutions une telle unité que l'étude du passé ne peut demeurer indifférente à ceux qu'alarment nos secousses modernes.

The States-General were in truth neither contemptible nor servile bodies. Their influence, direct and indirect, was greater than is often supposed; they did as much as could be expected from rarely recurring assemblies having no share in the sovereignty. Their sole immediate power was that of voting the taxes, and this was a tradition rather than a living fact. It was held that money could not be levied without their concurrence; over and over again the States asserted their right, and every age cherished the delusion that there had been a time when it had been respected. According to the men of the fifteenth century, Charles V. was the first king who levied taxes without consent; the sixteenth century charged the sin upon Charles VII. or Louis XI., the seventeenth upon Francis I.; and yet, in truth, there had never been an age when immunity from arbitrary taxation was the rule. In the annals of France not one king can be found who limited himself to the grants of the States. Practically the deputies could do little more than complain, remonstrate, and suggest; and this subordinate function they well discharged. Those who have read the *Histoire d'un paysan* will remember the elaborate process by which the expression of grievances was secured. As soon as the letters of convocation reached the provinces, each village began to draw up its *cahier*, a string of complaints and propositions of all kinds; delegates from the villages, in a meeting held in the *chef-lieu* of the *bailliage*, then digested these various *cahiers* into one. The States, on their assembling, set to work to cast the provincial *cahiers* into the form in which they were to be presented to the King. The first appearance of this process is in the States of 1468, in which we hear of the deputies having brought petitions, which were to be placed in the hands of the Chancellor; the improvement of a final digest was introduced in 1484 by the great States of Tours, whose example was followed by the assemblies of the sixteenth century. These *cahiers de doléances* are the chief monument of the States-General, and M. Picot speaks of them with almost enthusiastic admiration:—

Eglise, justice, législation, finances, commerce et armée, en un mot, toutes les questions qui intéressent la France s'y trouvent successivement traitées avec une connaissance approfondie des faits et parfois avec une admirable éloquence. . . . Les générations qui concevaient et proposaient ces réformes étaient capables de grandes choses: l'élévation de leur pensée, la hardiesse de leur style nous sont de sûrs garants de leur intelligence. Le sort de Louis XI., à l'avènement de Charles IX., deux fois sous Henri III.,

* *Histoire des États-Généraux, considérés au point de vue de leur influence sur le gouvernement de la France de 1355 à 1614.* Par Georges Picot, Juge au Tribunal de la Seine. Ouvrage couronné par l'Académie des sciences morales et politiques (premier prix du concours d'histoire). Paris: Hachette et Cie. 1872.

au début du règne de Louis XIII. les États nous offrent ces vastes compilations dans lesquelles on trouve à chaque page le souffle de 1789.

All this labour and intelligence was not so utterly thrown away as might be supposed. It seems to have been fated that the States-General should see no immediate fruit of their work, but the seed they sowed nevertheless came up in course of time. Charles V., Louis XII., Henry IV., Richelieu, one after the other carried out the ideas of preceding States-General, to whom must therefore be allowed a share in the honour of the measures of these rulers. Still, when all has been said in their favour, the fact remains that the States-General were a failure. While the kindred assembly in England fought its way up to supremacy, clinging with dogged persistence to every inch of vantage-ground, the French one let power slip through its fingers. M. Picot's four thick volumes carry us as far as its inglorious end under Louis XIII.; its terrible resurrection in 1789 not falling within the scope of his work. The States-General at any rate cannot complain of not having found a careful and an appreciative historian. Everything in which their influence was felt, whether in the general government of the realm, in ecclesiastical affairs, administration of justice, legislation, police, finance, commerce, the position of the noblesse, or military organization and discipline, is gone into with the utmost thoroughness and detail. Much of this is, as may be supposed, better adapted for lawyers than for ordinary readers, or at least for ordinary English readers unacquainted with technical French phrases; and we shall therefore confine our notice to the parts which possess an historical, social, or constitutional interest. M. Picot brings to his task the calm impartiality of the judge, and is as guiltless as Hallam himself of striving to whitewash one party or to blacken another. While sympathizing, as must everyone not wholly given over to the worship of royal or aristocratic despotism, with the efforts of the *tiers état* towards political liberty, he fairly points out that the blame of its failure rests, not alone with the King or with the privileged orders, but in some degree with itself.

Called for the first time to take its place in the councils of the realm by Philip the Fair, who convoked the first assembly of the Three Estates in 1302, the *tiers état*—to use the name of later days—did not become a power of any importance until the disastrous reign of John. The stormy assemblies of 1355 and 1356 must not be taken as ordinary specimens of States-General. The *tiers état*, then suddenly attaining power and setting to the work of reform with a will, found itself plunged into revolution, and from that time until 1789 never recovered the light it gave itself; or, as M. Picot puts it, "il pensait réformer, et il s'aperçut qu'il avait mené la France aux abîmes." It was under the pressure of dire necessity that John in 1355 convoked the States-General of the Langue d'Oïl. The English war having gone on intermittingly for nearly eighteen years, the King was at his wits' end. He had changed the nominal value of the coinage ten times in the space of a year, and nevertheless was reduced to order his officers to postpone payment of his debts. This ruinous prerogative of arbitrarily fixing the value of the coinage was among those which the Estates forced him to surrender. Their reforms were good, but the taxes, imposed with no great judgment, provoked in the provinces a violent opposition, which was diligently fomented by Charles of Navarre and his party. On the reassembling of the Estates there was not present a single deputy, noble or burgher, from Normandy or Picardy, those provinces taking this way of expressing their determination not to pay the new taxes. The Estates yielding, substituted for the obnoxious imposts an income-tax, which most historians have since strongly decried as pressing unduly upon the poor. This reproach M. Picot declares to be unfounded, adding, "La part de l'arbitraire était assez large sous le roi Jean sans qu'on l'exagère par des calculs erronés." That the man who had five livres a year should pay half a livre, while the first hundred livres of income were taxed at four livres, and every hundred after that at two only, was far from being an equitable arrangement; but our author seems to find sufficient compensation in the total exemption of the poor, and the taxation of the nobles, already burdened with the heavy weight of military service, at a higher rate than the non-nobles of equal fortune—a fact which points to the growing influence of the *tiers état*. That order had for its president the famous Etienne Marcel, provost of the traders of Paris, and patriot or traitor as one may choose to consider him, who played so conspicuous a part in the troubles ensuing upon the defeat of Poitiers. The course of events after that battle is sufficiently well known—the struggle between the young Duke of Normandy and the States-General; the rise of Marcel as the leader of the insurgent Parisians; the placing of the government in the hands of a commission of thirty-six members of the Estates; the revolutionary period when Charles saw two of his councillors murdered before his eyes, and was thankful to protect himself by putting on the red and blue hood of the insurgents; his escape from the capital where, though styled Regent, he was no better than a prisoner to the Parisians, and had been forced to receive with apparent friendship his rival and the favourite of the revolution—Charles of Navarre; the outbreak of the Jacquerie, the massacre of Paris by the Regent, and the death of Etienne Marcel among heads of loyal or treacherous fellow-citizens—in short, the whole round of revolution, anarchy, and reaction.

The remonstrances of the States-General, and the ordinances issued to carry out their desires, throw light upon the disorganization and misadministration of the period. The Royal Council was the subject of urgent complaint. Those who had any business with it were kept waiting without an answer for a

fortnight, for three weeks, for a month, till they went away in disgust, many of them so impoverished and embittered that "ceux qui estoient françois en sont devenus anglois, et leurs châteaux, villes et pays ont tourné en la main et obéissance de nos ennemis." The councillors did not proceed to business till near dinner-time, sat long over their meal, "et faisoit l'on peu après dîner les choses profitables." To stop the day's salary of any member who did not make his appearance betimes was the method devised, to ensure the diligence of the new Council imposed by the States upon Charles. The disorder which reigned throughout the administration was perhaps at its height in the military service. Armies imposing only in the estimates were known in the days of Poitiers as of Sedan; and the age of chivalry was not far behind modern times in roguery. At the reviews the captains swelled their companies with sham soldiers—*passé-polans*, as they were called; horses passed on from one man to another did duty over and over again; pages and servants were counted as men-at-arms:—

Ainsi un seul pour quatre du roy gages prenoient,

says a contemporary complaint upon the disaster of Poitiers. The King's kinsmen and other great men were not even put to the trouble of getting up stage battalions. Having only to furnish a list of the men they brought with them, it was easy to run the numbers up. It would be interesting to know how many of Froissart's gallant nobles and knights were capable of making deliberately false affirmations as to the number of their followers. Money rarely found its way from the treasurers of the army to the captains, who, in their turn, not content with cheating their superiors, cheated their soldiers also. The States took the most minute precautions to ensure that the men and horses they paid for actually existed, and that the supplies they voted should really go towards the war. Yet, in spite of all precautions, punishments threatened, promises or oaths exacted from everybody who might be tempted to divert the money, the King included, it appears that out of all the taxes granted not one half was ever spent upon the war.

In the earlier as in the later stages of the Hundred Years' War, the national spirit of the States was strong—for the unhonoured assembly which ratified the Treaty of Troyes can hardly be accounted a fair representation of the nation—and perhaps they never deserved better of their country than when they gave their staunch support to Charles VII., who in his hour of need turned to them for aid. The conduct of the States both of the Langue d'Oïl and the Langue d'Oc rises to the heroic when the circumstances are considered. Subsidy upon subsidy was drawn from the suffering and ruined country—or rather from that part of it which had not fallen into the English power—to feed a wasteful and incapable administration, and to spin out an apparently hopeless resistance. At last, under the constant calls for fresh and unavailing sacrifices, the public zeal began to flag. Three times Charles convoked in vain the deputies of the Langue d'Oïl:—"Il fallait désormais, pour toucher les cœurs et mettre en mouvement les députés, d'autres promesses que celles dont on les leurrait depuis six ans." Full liberty of discussion appears to have been the chief inducement held out to the States which assembled at Chinon in 1428. Cautious deputies, no doubt remembering how three years back at Mehun-sur-Yèvre a favourite courtier, the Sire de Giac, irritated by comments upon the indiscipline and marauding practices of the royal troops, had proposed to his master to drown those who thus remonstrated, would require the reassuring promise that every one should be free "de dire, pour le bien des besognes, tout ce que bon lui semblera." The pressing question of the moment, however, was, to use the phrase of Cromwell, not one of well-being, but of being at all; Orleans was threatened by the English, and must, if possible, be saved. For its relief, hereafter to be achieved by Joan of Arc, an aid of 400,000 livres was granted, and absent nobles were summoned from their waiting upon Providence to range themselves, "in this extremity," beneath the royal banner. This intimation of slackness among the great men is noted by the author as showing the popular character of that struggle which had for its chief a peasant girl; it was in the people that the French monarchy found its best ally. M. Picot claims for the States-General the honour of having done in their way as much for Charles "the Well Served" as his captains did in the field. How, he goes on to ask, was it that their lot was so different?—

Pourquoi cette institution ne recueillit-elle pas une part, quelque petite qu'elle fut, de la juste popularité qui couvrait de leur vivant Xaintrailles et Dunois? Comment se fait-il enfin que le généreux effort accompli par une nation ruinée n'ait rencontré ni la reconnaissance des contemporains, ni même le souvenir de l'histoire?

The answer is easy, and M. Picot supplies it. The deputy who voted taxes and his constituents who paid them were undoubtedly patriotic and self-sacrificing, but they stood a poor chance of popularity and fame as compared with the leaders who actually drove out the English. Heroic deeds and successful combats were things to look back upon with pride and pleasure; taxes were only disagreeable incidents which might as well be forgotten. Black looks and bitter words from the taxpayers were probably often the only recompense the deputies met with on their return to the provinces, and, weary of granting away money, they failed to see what a weapon had been put into their hands by the weakness of Charles at his accession, when, afraid to levy taxes of his sole authority, he had eagerly sought their support. Peace came, and the States-General quietly abdicated. Charles was allowed to create a permanent army, and, though not in so many words, practically

to establish a permanent *taille* for its maintenance. Except from the nobles, no protest was heard; with the *tiers état* the measure appears to have been popular. Order and public peace, the first needs of the country, were secured, and the non-privileged class was gratified by the nobles being thenceforth forbidden to levy *tailles*. In its eagerness to spite its feudal tyrants, the nation never stopped to reflect that it was building up the royal despotism:—

Les États Généraux, frappés dans leur essence, devenaient par le fait absolument inutiles. . . . Aussi Charles VII ne convoqua-t-il plus la nation; hors les pays d'États, où le principe de libre discussion continu à prévaloir, la taille fut levée d'autorité dans le royaume.

(To be continued.)

SPENCER'S DESCRIPTIVE SOCIOLOGY.*

IT is well known that Mr. Herbert Spencer has for some time past been engaged in preparations for that part of his System of Philosophy which is to be called "Principles of Sociology." Probably the name must be accepted now, though barbarously formed and scarcely justified by necessity. The scientific study of man as a social or political animal might have been comprehended in the term "politics" without any violent extension of classical usage; indeed Mr. Spencer himself clearly regards politics in the popular sense as the art corresponding to the science in question; and the inconvenience, if such it is, of having but one name for a kindred art and science is one which we tolerate in many other cases. For the word "Sociology"—which, even if such hybrid formations were allowable, would not naturally convey the meaning it is intended to convey—we believe Auguste Comte is responsible. The credit is also claimed for him of having invented the thing. Considering that Socrates very positively expressed the opinion that politics ought to be scientifically studied instead of being left to rule of thumb—an opinion, by the way, which Mr. Herbert Spencer has quite recently (*Contemporary Review*, August, 1873) enounced in a strikingly similar manner—considering also that Plato and Aristotle both applied themselves to work out this thought elaborately in their different ways, and that, if more modern instances are required, we find them in such writers as Hobbes and Spinoza, the pretensions advanced on behalf of Comte's Sociology as a wholly new light do seem a little overconfident. But to return to Mr. Spencer's work; his object is to examine the natural laws which govern the development of societies, as he has examined in former parts of his system those which govern the development of individual life. Now it is obvious that the development of societies can be studied only in their history, and that general conclusions which shall hold good beyond the limits of particular societies cannot be safely drawn except from a very wide range of facts. Mr. Spencer has therefore conceived the plan of making a preliminary collection, or perhaps we should rather say abstract, of materials which when complete will be a classified epitome of universal history. Such a task can be accomplished only by a division of labour; and accordingly the compilation of the facts has been entrusted to others, the arrangement being Mr. Spencer's own.

We now have the instalment relating to England, consisting of seven classified tables, followed by seventy pages of extracts from various authorities in the nature of *indices justificatives*. The book is in folio and not convenient to handle. This seems inevitable, for the mechanical difficulties of carrying out the plan must have been considerable, and the tables could not have been exhibited on a smaller page. But as there are several more such folios to come, we are inclined to think it would be a timely relief if the publishers would also supply an easel to read them on. The tables are disposed in parallel columns, so that each column presents to a reader who runs his eye down it a summary of the state of some particular class of social phenomena at successive periods; while cross divisions, of which there are three or four in a page, mark off the table into horizontal bands each of which gives a general view of the social development attained in the period covered by it. The names of "Chief Persons" find their place in a narrow column running down the centre, and again subdivided for "Rulers," "Executive," and "Incentive." The first subdivision does not profess to show who were the persons that really governed England from time to time. The difficulties of making out such a list with sufficient certainty in a work of this kind would no doubt be grave, and what we have here is in fact simply a list of sovereigns with the dates of their accessions. The statesmen are found, along with soldiers, lawyers, ecclesiastics, and generally men distinguished in active public life, in the subdivision "Executive"; the men of science, arts, and letters being classed as "Incentive." This nomenclature seems to us well chosen; it hits the exact point of difference between the two kinds of social activity. We cannot now go into the details of the general classification; it is hardly to be understood except by actual inspection of the tables, and it would be perhaps premature to form any positive judgment on the scheme from this single instalment of the work. But the task is one eminently fitted to be dealt with by Mr. Herbert Spencer's faculty of scientific organizing, and whatever criticisms may suggest themselves on particular points, there is at least a strong presumption that, on the whole, it could not be

done better. As far as this volume goes, the arrangement seems clear and comprehensive. There is only one point on which we see a possibility of confusion; there is one column for "Aesthetic Sentiments," and another for "Aesthetic Products"; these are separated by nearly half the width of the table, and the history of literature and art is distributed between them in a somewhat inconvenient manner.

As touching the matter which fills these classified columns, we have to look, not to Mr. Herbert Spencer, but to his assistant, for the merits and the responsibility of the compilation. The extent of authorities to be consulted was very great; anything like independent research was clearly out of the question; and it would be unreasonable to demand minute accuracy where the avowed object is to furnish materials for a broad and summary view. The result of Mr. Collier's labours on the political and social history of England is a book of reference which will be very useful to students who know how to use books of reference—that is, as aids to their own reading and judgment, but not as substitutes for them. Indeed a conscientiously written book of this class ought constantly to address the reader, as the best of them do, in such a manner as to suggest to him that he is not expected to take the author's conclusions for granted. And when readers are misled by accepting in an unqualified manner statements which on the face of them are only condensed notes, it is generally as much their own fault as that of the writers.

Here the abridged text of the tables is, on the whole, well supported by the collection of extracts following them. From the nature of the case, many of the works from which the extracts are taken are themselves in the nature of books of reference, and the caution we have just indicated is therefore very necessary. The selection of authorities is somewhat miscellaneous; but the right ones are there for the most part, and it is no great harm if others are thrown in which do not really add much weight to them. It would perhaps be vain to expect that there should not be inequalities in the handling of the different departments. The divisions which satisfy us least are those containing the history of theological and artistic development. Under the head of "Religious Ideas and Superstitions" we find matters relating to theology proper, ecclesiastical discipline (notwithstanding that there is a separate head for ecclesiastical institutions), and folk-lore, surviving from Pagan times or otherwise, mixed up in a disorderly fashion; and the extracts are not so carefully chosen as elsewhere. Reeves's *History of English Law* is an odd authority to quote to show what are the sacraments of the Roman Church. We do not say that it was a duty to seek out the best Roman authority to illustrate what may fairly be deemed matter of common knowledge. But the 25th Article of the Church of England might have furnished a not less obvious and a more fitting reference than Reeves's History. Again, some items are put forward which, though amusing enough, are scarcely pertinent; such as the accounts of a mystery play, "For a new booke to hang Judas, sixpence," and the like. This is not equal in itself to the more modern bill of a church decorator, "For mending the Commandments, altering the Belief, and making a new Lord's Prayer"—preserved, if we remember right, by Southey—nor does it contribute much more to the history of English theology. A certain vagueness about ecclesiastical matters seems to have crept even into Mr. Herbert Spencer's classification. We are at a loss to understand why the column entitled "Professional," and representing the progress of the secular learned professions—and, by the way, it is a very meagre column—appears in the tables as a subdivision of "Ecclesiastical." Perhaps it may be only the tyranny of printers which caused a cramped arrangement of the headings.

Coming to aesthetics, we are a little surprised to find M. Taine's *History of English Literature* chiefly relied on, not merely for facts concerning our eighteenth-century writers, but for criticisms on them. We have a great respect for M. Taine, but are not disposed to accept on his authority the proposition that Burke had no taste. And in the table for the period 1688-1714 occurs the sweeping sentence "Literary descriptions crude and anatomical"—which, on referring to the corresponding part of Mr. Collier's digest, appears to be founded on nothing but M. Taine's opinion of a particular passage in the *Spectator*. This generalization from an isolated judgment of a foreign critic is not a very safe way of epitomizing an important period of English culture. The history of the law, a branch of history the importance of which not only to lawyers, but to all who mean to understand history, is now justly recognised, has due space assigned to it in the compilation; yet the facts as tabulated are so condensed as to be sometimes unintelligible or misleading. For instance the statement, under date 1844, "Livery of seisin first formally abolished," is inaccurate; and the inaccuracy, though it may be called only technical, is worth noting because it obscures one of the many little marks which show the constructive and conservative nature of English law reform. The ceremony in question has not been abolished, but only rendered needless. Any one who may be so minded is still perfectly free to convey land in the ancient form, of which the solemn actual delivery of possession is an essential part; only nobody does it on this day, as a grant by deed without further ceremony is now sufficient. Another slip, trifling but strange, is the assertion that the last stocks were "removed" in 1826. Physically removed they were not, for some are still to be found standing and in good working order.

But, for reasons we have already mentioned, as on the one hand no skill of the compiler can effectually prevent a work of this kind from being a snare to the idle and the unwary, so on the other

* *Descriptive Sociology, or, Groups of Sociological Facts. Classified and arranged by Herbert Spencer. English. Compiled and abridged by James Collier. London: Williams & Sonnes, 219.*

hand a small admixture of errors in detail will be no hindrance to its being useful in the hands of those who know the right use of it. The plan of this *Descriptive Sociology* is new, and doubtless the experience to be gained as the execution of it proceeds will suggest many improvements. We shall look with curiosity to the promised application of the same method by Mr. Herbert Spencer and his fellow-workers to the history of other countries and civilizations.

HUXLEY'S CRITIQUES AND ADDRESSES.*

IN an evil day for his health and peace of mind Professor Huxley was prompted by his zeal for the furtherance and diffusion of knowledge to offer himself as candidate for a seat at the London School Board, and his ill fortune, in the disguise of success, seated him in the coveted place. Throwing himself with his wonted energy into the work, or rather the talk, of that body, during the critical first year of its existence, while the struggle was hot for supremacy in the discussion forum and for the ascendancy of rival crotchets, his bodily stamina showed signs of yielding to the strain of so much additional exertion, and to the galling sense of being continually in the minority. We cannot regret that he decided on withdrawing betimes from an arena in which practical good sense seemed in danger of being set aside by theoretical philosophy, and in which far more good was to be done by a plain knowledge of human nature and experience of the ways of children than by the most powerful mastery of physiological or metaphysical problems, or the most ideally perfect system of the higher education. Now that the School Board has really got to work, and seems for the present content with the humbler task of teaching thousands of poor children to read, write, and cipher, it is chiefly as an exhibition of dialectical or speculative prowess that we look back to many of the contests round the Board table or in the public press which the first abstract treatment of the great education question called forth. To see such champions of the advanced philosophy and science of the day as Professor Huxley and Mr. Herbert Spencer for once arrayed against each other, albeit in most courteous and knightly fashion, must be a treat to what we may be permitted to call the fancy of the intellectual ring. And we are not sorry to find the challenger placing at the head of his lately issued reprint of *Critiques and Addresses* the discourse which led to this friendly passage of arms. It is to be deplored that in the opening exchange of blows the combatants show themselves to a strange extent beating the air. In his address to the Midland Institute on Administrative Nihilism, Professor Huxley had laid down the views of a certain advanced school of philosophers of which Mr. Herbert Spencer, at all events since the death of Mr. Mill, is the recognized head, as limiting the functions of government to those of a mere *astynomocracy* or regulative police as opposed to either a monarchy or a democracy. The State, according to this view, is simply a police functionary, and its duty is neither more nor less than to prevent robbery and violence and to enforce contracts. And for these views Professor Huxley finds in writings of this school two lines of argument—one of a deductive kind, from an assumed axiom of political philosophy, the other as the result of experience—tending to show that whatever is done by a Government beyond these limits is not only sure to be done badly, but to be done much worse than private enterprise would have done the same thing. Stated thus nakedly, we are not surprised at Mr. Herbert Spencer's having written under the title of "Specialized Administration" in the *Fortnightly Review* to repudiate this view, with a special reference to education. At the same time we share the difficulty of Professor Huxley in drawing the line between the policy of *laissez-faire* in relation to this question, and that maintained in the face of the Vaccination Act, the Contagious Diseases Act, the limitation of the hours of labour, and so forth. Nor is it clearer to us than it is to the Professor how much is gained by the substitution of the more sounding formula of "negatively regulative control." It would surprise many admirers of so-called advanced philosophy, were it but stripped of its more sonorous and complicated phrases, to find how little advance in actual knowledge or ideas had been made from times which are now called ignorant or obsolete. Mr. Spencer's ingenious parallel of the functions of government with the organization and development of the nervous system in man may be turned, as Professor Huxley argues, to far greater force against the negative view of State functions. The sovereign power of the brain thinks for the physiological organism, acts for it, and rules the individual components with a rod of iron; though we must add to the Professor's reasoning the consideration that uprisings are, in the corporeal as in the political organism, not unknown on the part of the inferior members, to the sore perturbation or discomfiture of the powers on high. Falling back upon Locke's golden or crystal formula of the end of government as the good of mankind, he leads us by successive instances of what the State may legitimately or should imperatively do, to the conclusion that it may and should educate the people. With no special love for Academies on the Continental model, or for the State taking into its hands the whole higher education of the nation, fostering all sciences and decorating all scientific men, he would have the elements of knowledge and the material appliances of research and study as universally brought within the reach of all as by the Poor Law system the essential

necessaries of life are guaranteed to all. Not less keen and incisive is his logic in cutting the knot of the so-called theological question. Of the two extreme sections, the religious dogmatists on the one side and the secularists on the other, he has the same opinion as to their being hopelessly in the wrong. The first is crying for more theology under the name of religion; the second unwisely and wrongfully admitting the assumption of their opponents' clamour for the abolition of all religious teaching, when all they really want is to be free from theology—"burning your ships to get rid of the cockroaches." The mere crumming of the understanding, without regard to the moral and religious nature, he knows to be a hollow delusion. "No human being, and no society composed of human beings, ever did or ever will come to much unless their conduct was governed and guided by the love of some ethical ideal." And, were he compelled to choose for a child of his own between a school in which real religious instruction is given and one without it, he would prefer the former, even though the child might have to take a good deal of theology with it. Nine-tenths of a dose of bark is mere half-rotten wood, but one swallows it for the sake of the particles of quinine. And he would ask by what practical measure is the religious feeling, which is the essential basis of conduct, to be kept up in the present utterly chaotic state of opinion on such matters, without the use of the Bible, woven, as this book has been for three centuries, into all that is best and noblest in English history:—

Hence, when the great mass of the English people declare that they want to have the children in the elementary schools taught the Bible, and when it is plain from the terms of the Act, the debates in and out of Parliament, and especially the emphatic declarations of the Vice-President of the Council, that it was intended that such Bible-reading should be permitted, unless good cause for prohibiting it could be shown, I do not see what reason there is for opposing that wish. Certainly, I, individually, could with no shadow of consistency oppose the teaching of the children of other people to do that which my own children are taught to do. And, even if the reading of the Bible were not, as I think it is, consonant with political reason and justice, and with a desire to act in the spirit of the education measure, I am disposed to think it might still be well to read that book in the elementary schools.

Much as we regret on public grounds the withdrawal of manly and clear-spoken advocacy like this from the Metropolitan Board, we look forward with hope to Professor Huxley's energies being recruited by his exclusion from the great palaver, and to his words of weight being duly pondered by the reading public. Pleased as we are, however, with what he has to say on Schools and School Boards, it is to the residual and chief portion of the present book that we must turn for the exhibition of his true powers. On subjects of physiology and the animal organism he is on his own vantage-ground. His store of fact and strength of reasoning give him here a mastery not easily to be questioned. The formation of coal, for instance, has never perhaps been treated in a popular form and within so short a space with equal fullness and perspicuity. The successive steps by which the true nature of the vegetable constituents of our coal seams has been made clear, and the process through which the deposit has been subsequently mineralized, will be found succinctly and lucidly set forth. So far from being referable to vegetable organisms of a former age, now extinct, it has been established that the secular matter of which the greater part of bituminous coal is made up, as distinct from mineral charcoal, consists of the spores and sporangia or spore cases of lepidodendroid and other plants closely allied to the club mosses of our day, other parts of which have furnished the carbonized stems and the mineral charcoal, or have left their impression on the surfaces of the layer. Ordinary coal may in general, Professor Huxley believes, be demonstrated to be nothing more than secular matter of this kind, which has undergone a certain amount of that alteration which, if continued, would convert it into anthracite. He is of course utterly opposed to the queer doctrine of Mr. Jukes and others, that coal was a submarine deposit, and is even inclined to demur to that of the soils on which it was formed having been wet and swampy, such evidences as those of marine animals or shells being found in the coal seams simply pointing to the fact of subsequent submergence. Depressions and elevations many in number must needs have taken place to have resulted in the alternate layers of coal and sandstone or shale, with the invariable under-clay, which mark the carboniferous formations. In some places the original forest bed of sigillaria or lepidodendrons has sunk three or more miles to its present place of rest, leaving it doubtful whether it will ever repay the labour of man to draw forth its bottled sunbeams to eke out our failing stock of substitutes for solar heat. In his calculation of the time over which these stupendous changes of the earth's crust and these rich deposits of vegetable wealth must have extended, we question whether, despite the high authority of Principal Dawson, he has taken proper account of the evidence yielded by the roots and stools or broken trunks of trees *in situ* common among our coal measures. These stumps retain in places a height of many feet above the level at which the deposit of leaves, spores, and sporangia must have begun. Exposed to the process of weathering, and preyed upon by parasite or insect life, could they have retained their present cylindrical form intact for anything like the immensity of time during which it has been held the accumulation of the surrounding bed must have been going on? Anything like a definite scheme of chronology must, as Professor Huxley allows, be in this case as much beyond the existing resources of science as in the case of the accumulation of coral reefs, on which subject he gives us an interesting and valuable paper. To the present day, and extending

* *Critiques and Addresses*. By Thomas Henry Huxley, LL.D., F.R.S. London: Macmillan & Co. 1872.

back to almost any period within which the relations of sea and land have existed upon the earth, have the ancestors of these minute polypes been at work, building up, not reefs alone, but continents, of rock, to a height measured by thousands of feet, and over an area of thousands of square miles. Taking Professor Dana's measurement of one-eighth of an inch a year as that of the average increase of thickness of a coral reef, and limiting ourselves to the very ordinary thickness of such a reef, we get to 192,000 years as the period of its formation. The organic nature of these marine productions, which in Ovid's time and for seven centuries later were taken for sea-weeds, has been established by the successive investigations of Loccone, Peyssonel, and Trembley, and the secret of their working has been brought to light by the keen observation of Darwin, whose theory of the growth of reefs and atolls is clearly expounded in the present essay. On the subject of yeast, the controversy still raging as to the chemical or the organic nature of the phenomenon is left without a full decision, though Professor Huxley's leaning to the side of the germ theory is not disguised. The discussion has led investigators, he shows, face to face with problems of immense interest as well in pure chemistry as in animal and vegetable morphology. This speculation connects itself with that of his Presidential Address to the British Association in 1870, and here reprinted, on Biogenesis and Abiogenesis. Upon this we have the less occasion to remark at present, having spoken of it at the time, as we have also done with reference to his paper on British Ethnology, the weakest, or, we should prefer to say, the wildest, portion of the volume before us. Even assuming his melanochroi and xanthochroi to be two separate races "in the biological sense of the word race," we wholly fail to see how they have got commingled, as they are supposed to have been at an early period in the British islands, producing that homogeneous stock which Professor Huxley is delighted to recognize alike in Irishmen and Cornishmen in Celt and Teuton. His real powers are seen, in our view, to far greater advantage in the *Genealogy of Animals*, a review of Dr. Ernst Haeckel's *Natural History of Creation*, or in disposing of Mr. Darwin's *Critics*, especially of the *Quarterly Review* and Mr. Mivart. We part with the author for a while in the earnest hope that an interval of well-earned rest and leisure will restore him with recruited energies to his place as an investigator and instructor, eloquent and persuasive alike in the lecture-room and in the press.

FRENCH HOME LIFE.*

CRITICISM from the point of view of the "intelligent foreigner" is a form of instruction which we English are fond of inviting. The only drawback to the value of the testimony of the intelligent foreigner is that the range of his observation is too often limited, and that his temptation to rush to conclusions on insufficient data is great. This reproach can hardly be levelled against this book by our neighbours across the Channel. We learn from the preface that the author of these essays, now republished in a collected form, has embodied in them the experiences of a quarter of a century passed in a country which he regards as a "second home." His attachment to France is fully borne out by the kindly spirit in which his comments are conceived, and which will further recommend them to French readers. To us, whose task it is to criticize the critic, this book appears to be a careful study of an interesting subject, exhibiting no little acuteness of observation and analytical subtlety. The author is not without prejudices, and now and then the desire to say a telling thing betrays him into exaggeration; but, on the whole, he is not merely an entertaining, but a trustworthy, guide in the field of inquiry which he invites us to explore in his company.

"Home Life" is a comprehensive term, including many departments and various phases of domestic experience. Considering how large is the part which servants play in it, there is a certain fitness in beginning, as our author does, with a chapter on "Servants." In it he describes the moral effects which the ideas of '89 have produced on the minds of that class. Equality between master and man is a reality in France, but it is an equality of a special character, which evidences itself in a peculiar manner. It in no way involves a shade of doubt as to the temporary superiority of the employer over the employed, or diminishes the habitual deference and respect of manner which is expected from a servant; but it maintains intact between the two the pre-existing abstract truth that in morals and in law one is as good as the other; it covers the dignity of the server towards the served, and keeps them both assured that, directly they separate, their relative positions will once more become identical, not of course in the passing accident of social rank, but in the universal bond of common humanity. Hence it is that French masters are so often friendly with their servants, and discuss family affairs with them. There is no barrier, as in England, between them; only a tacit recognition of a connexion which, while it lasts, suspends equality. The fact that he can put an end to this suspension when he likes encourages the temporary inferior to support it while it lasts. The English servant is always struggling to maintain his imaginary dignity by sticking out for the infinitely small privileges which by degree, and under pressure, have been conferred upon him. The Frenchman, feeling that his rights as a man are absolutely

on a par with those of his master, attaches vastly less importance to his rights as a servant, and is consequently ready to do whatever you ask provided only you ask in a way which pleases him. He never raises the objection, so common in the mouth of English servants, "It's not my place to do it." If there be any reason for it, a cook will clean the drawing-room, a footman will cook the dinner, a lady's-maid will black the boots, without any growling, and rather as fun than otherwise. This adaptability is a peculiar merit of French servants. Their general characteristics are said to be activity, cleanly aspect (we observe that our author refrains from saying *cleanliness*), cheery temper, simplicity, and economy. In the last particular they present a marked contrast to the habitual thoughtlessness of their British confrères. Paris servants constitute a class *en genere*, "much less worthy, but far more interesting." Our author refers to the degrading and demoralizing effects of the sleeping arrangements for servants in Paris, which are the result of the general adoption of the "flat" system. In this particular, at least, English homes contrast favourably with the French "appartement." Considering the license they enjoy, our author thinks it wonderful that Paris servants are as good as they are. There are scamps among them, but there are a great many excellent creatures too; and "quantities of brave girls, who get up in the early morning to go to mass, and walk to their beds down those foul corridors with their eyes straight before them and their ears resolutely closed, like little snails whom no temptation can touch." On the whole, our author pronounces strongly in favour of the merits of French servants and the conditions under which their services are rendered. Nothing in the book, by the way, do we more warmly endorse than the sketch given in it of the immense superiority of the brisk and cheery *garçon* to the "greasy-coated, dough-faced, pretentious," and let us add rapacious, hotel-waiters of these islands.

Of French children our essayist has something to say. No one can have visited our neighbours across the Channel without perceiving what an important part children play in society; or, to put it less euphemistically, as this book does, what a development the art of spoiling has reached in France. Nevertheless, in French girls, and their way of bringing up, our author finds much to commend. Living side by side with demonstrative mothers, they soon learn to copy their gushingness and susceptibility to emotion. But this constant contact with their mothers has its good side. Girls learn to keep house, and to receive visitors, and cultivate the faculty of conversation. The French girl learns how to be a woman from her cradle; and this offers a large compensation for want of discipline and of the habit of application. Of French boys our author has formed a much less favourable opinion. The great majority of them he pronounced to be deficient in pluck and manliness. Their system of education is opposed to the development of these virtues. It is at school that they pick up the sneaking little notions which are so universal among them. They make faces at each other, they kick, they slap; but as for real hitting, as for defending a point of honour, as for hard rough games where force and skill are needed—who ever heard of these things in France? In discussing the causes of the late defeat of France, our author thinks that sufficient importance has not been attached to the effects produced by the education of the boys, to the utter want of stubborn pluck which characterizes it, and to the facility with which the higher moral teachings disappear when manhood comes. Until there is a radical change in the character and training of French boys, there will be small hope of seeing France take her old place again among the nations. Their whole early training would seem to be designed to develop cowardice. They are forbidden to fight; and if one boy should strike another, even in self-defence, all the other scholars would tell the master, and the offender would be punished as a danger to society and a corruptor of good morals. A Swedish boy at a *pension* in Paris was once called a liar by an usher of sixteen years old; the youngster went straight at him, got home his right on his teeth, and his left behind his ear, and then asked him if he would have any more; whereupon the thirty-seven other boys in the room rushed together at the Swede, rolled him on the floor, and stretched themselves on his body as if he were a rattlesnake in a box. When the poor fellow was got out his nose was flattened and his arm broken. Those thirty-seven boys were quite proud of it, and were ready to begin again.

The "singular skill of the French in the preparation of food" furnishes a topic to which a chapter in this work is dedicated. Our author dilates on the superior economy of French cooks, which is chiefly effected by the habit of buying in small quantities. He calculates that kitchen management in France is cheaper by one-third than it is in England. And when it is found that this vast saving is accompanied with extraordinary superiority in the nature of the food itself, English food arrangements can only be regarded with "stupefaction." "Boiling," as understood by English cooks, in particular, is denounced as an act of wasteful folly. We boil out of meat all its essences and juices, and then eat the tasteless azote-less relics of our work, while we diligently throw away the dirty water containing all the nutrition which we have distilled. The French dogma, on the contrary, is that everything which is in the food ought to be left in it by the cook, and to be found in it by the eater. Comparing the average amount of food consumed per head in the two countries, our author shows that its total weight is greater in France than in England. It is not, however, made up in the same way. A Londoner consumes more meat; a Parisian more bread and vegetables. His conclusion

* *French Home Life*. Originally published in Blackwood's Magazine. London: Blackwood & Son. 1873.

is that the French are at least as well fed as we are, while they spend much less than we do, and have vastly more agreeable eating.

Into a chapter on French manners the position and influence of women must necessarily largely enter. Of the urbanities which have their root in the innate desire of one sex to charm, and of the other to render homage to female charms, our author speaks in terms of high commendation. As between man and man he considers them to be carried to the verge of hollowiness and unreality. Excessive courtesies between men who neither like nor respect each other are in this generation peculiar to France. Certain details of French manners the author justly eulogizes. It is one of the highest merits of the system that it tacitly lays down the principle that all persons meeting in the same house know each other without the formality of an introduction. Any man may ask a girl to dance, or may speak to anybody at a private party. This is an intelligent and most practical custom; it facilitates conversation, it dispels awkwardness; it makes it possible to pass a pleasant hour in a house where you do not know a soul; it gives a look of warmth and unity to a room. Another merit in French manners is the general absence of *mauvaise honte*. If a boy drops his book at church, he picks it up without blushing. A Frenchwoman takes off her bonnet and arranges her hair before the glass in a railway waiting-room, without a thought of the presence of bystanders. In her eyes all such things are so natural, so much a matter of course, that it never occurs to her to make any fuss about them. No doubt she is right in the main; but it will probably occur to some of their foreign visitors and critics that the French sometimes carry their doctrine of the needlessness of reserve in all that they are pleased to consider natural to an undesirable extreme.

In an interesting essay on the language, our author points out some curious analogies between it and the national character. Two features are selected for special eulogy—the conjugation of the verbs, and the practice of placing the adjective after, and not before, the noun. The first, which contrasts favourably with our “shabby system of auxiliary verbs,” the French share with other nations of Latin race, as also to a great degree the second, which may be defended on the ground that it is more philosophical to state what the subject is before we begin to assign to it its peculiarities. Differences of idiom throw a curious light on national characteristics. Our author points out that the French tongue contains no such word as “sober.” The entire absence of any word descriptive of that state is suggestive enough. The English drink enough to need a special illustrative title for a man who has not drunk; the French have never yet felt the necessity of forming any such curious subjective, or rather negative, appellation; consequently they have not got it. A second example of the evidence of character betrayed by language is the absence, in French, of any word equivalent to “listener.” The only interpretation of so odd a blank lies in the supposition that each Frenchman chatters for himself, not for others; and that, not caring whether he is listened to or not, he has never recognized that he has no denomination for the person to whom he speaks. This is ingenious, but it does not appear to strike our essayist that his second instance of a “gap” in the language is not quite analogous to the first. There is no word for “sober,” he contends, because sobriety is so much the rule that a word to express the habit is not needed. There is no word for “listener,” not because all Frenchmen are listeners, but, on the contrary, because in a nation of universal chatters the function of a listener drops completely out of observation. Still more fanciful is the notion that the absence of any word corresponding to “dowdy” is to be connected with the universally smart and neat appearance of Frenchwomen. As regards pronunciation, our author gives the palm to the French spoken in the district from Orleans to Tours. He asserts that the children who make dirt-pies on the borders of the Loire pronounce far better than the actors of the Théâtre Français. Probably this is an exaggeration; but it is no doubt true that the purest French is spoken in the central regions, just as the best English is said to be found in Northamptonshire.

Our notice of the chapters on “Dress” and “Marriage” must necessarily be brief. Extravagance in dress is justly criticized as one of the worst social features of the Second Empire. When all possible varieties of form had been exhausted, the ladies of the period took up colour; and if Germany had not intervened, they would soon have worn out colour too, and have had nothing left to choose from. The reaction which has now set in is against all colour; women are wearing tints which have no names, which never were real, or fresh, or true, but which still do not quite reach the tone which we design by “faded.” It is amusing and very characteristic to find that they are called by Paris *des couleurs provinciales*, as being in sympathy with the ambiguous sort of government which France just now possesses, neither Monarchy nor Republic. French marriages our author believes, in a vast majority of cases, to be happy marriages. The oneness of existence which is so distinctive a characteristic of married life in the middle and trading classes, and which is shown by the frequent presence of wives in their husbands’ offices and shops, strikes him as a merit in their system. But the cautious and prudent spirit in which the whole subject of marriage is handled in France does not escape criticism. This is in part attributable to the legal formalities and difficulties with which marriage is surrounded by the operation of the Code Napoleon, and to the extraordinary control which parents have over the marriages of their children. Upon another branch of this

subject our author makes some observations—namely, the startling diminution in the fecundity of French marriages. In 1770 the children born in France were in proportion to the whole population one in twenty-five; now they have come down to one in thirty-five; the falling off has consequently reached the enormous figure of forty per cent. Our author does not shrink from asserting that this result is due to the widespread application of the Malthusian principle of circumspection in marriage. The question is difficult to discuss in a work of this kind; but its bearing on the national future of France is of an importance that cannot be overrated.

MY LITTLE GIRL.*

HOW can we hope in two short columns to analyse a story which boasts of two or more authors, three heroes, two heroines, a good angel and a Mephistopheles, and the scene of which shifts from an island in the Pacific to Gray’s Inn, and back again from Gray’s Inn to an island in the Pacific? Our readers may perhaps wonder how the number of heroes and heroines can be unequal, whereas generally, like the animals in the Ark, they are brought in by pairs. The explanation is an easy one. The principal heroine, in her entire ignorance of the meaning of matrimony, marries the wrong hero, in the hope of pleasing the man with whom she is, if only she knew it, deeply in love, and who is, if only he knew it, still more deeply in love with her. Her husband, the wicked hero, takes to drinking, and, dying penitently in the last chapter but two of the third volume, where the mortality of sinners, and indeed of saints also, is usually high, leaves his blessing to his wife and his widow to his rival, the unmarried one of the good heroes. It was not till we had got to the end of the first book that we had any suspicion of the existence of this couple which is at last to be so happy. We will own that at that stage of the story we did feel somewhat aggrieved when we found that we had an entirely fresh set of people to become acquainted with, and an entirely new set of circumstances to learn. The story had seemed, up to this point, clear enough. There was a beautiful girl who would grow into a beautiful woman, with a large fortune. There were two boys already fighting for her like boys, one of whom was to be handsome and good, and the other handsome and bad; there was a mysterious mother, and there was an utter scoundrel who had destroyed the register of one marriage and forged that of another. Here was ample material for three full volumes, and yet to our utter amazement, and we may almost say indignation, in the second book a briefless barrister appears as the real hero, and My Little Girl, the grand-daughter of a laundress, as the real heroine.

We must, in giving an account of the story, begin, where our authors begin, with the two boys in the island in the Pacific. The younger of them, Arthur, was the legitimate child, and the elder, Philip, the illegitimate child, of a wealthy planter, George Durnford. Philip’s mother, Marie, was a beautiful mulatto, gifted with a magnificent voice. When her lover turned her off and married, she went to London, and with the money he had given her “she learned all that a woman should learn, and more.” She became an accomplished singer, and went on the stage, and amassed a great fortune. This, at the close of the third volume, was found very convenient by the hero and the widow who wanted to marry, but except for her money would not have had enough to marry on. In fact, we suspect that the mother was altogether invented—except indeed that heroes must have mothers—to find a fortune for her son’s widow. Old bachelor uncles are almost worn out, and there is a certain novelty in making the good hero gain a fortune through the mother of his rival, the wicked hero. She is, too, very effective, we must not forget, at her drunken son’s death-bed, and a month or so later goes down herself, in the most exemplary way, in the wreck of a steamer. We are, however, anticipating matters. The two boys are brought up together in the belief that they were cousins. They have a playmate, Madeleine, whom they each intend to marry, and a wicked tutor Mr. MacIntyre. After a few years cholera breaks out in the island, and carries off their father. MacIntyre takes advantage of the confusion that follows on the death to steal some valuable documents, to cut out the register of George Durnford’s marriage, and to insert a false one of his marriage with Marie. He has no immediate end in view, but he thinks that some day or other he may find it useful. He does indeed throw out some hints to Philip, but he, who in spite of all his faults was early in the book honourable enough, kicks him out of the house. At this point of the story a gap of ten years occurs, and with it a total shifting of the scene. We are introduced to a certain Club, called The Chorus, which met in some chambers in Gray’s Inn. The common footing on which its members met was a want of success. Should any member cease to be a failure, he ceased to be a member of the Club. There was Hartley Venn, the hero, a barrister who knew no law and wrote articles that no magazine would publish. There was Lynn, who knew law but never had any briefs; and there was Jones, who wrote poems that were never published and plays that were never acted. Of the original twelve who formed the brotherhood, nine had been expelled for their success. Venn, some twelve years before, had begun to divide his time between the Club, the composition of

* *My Little Girl*. A Novel. By the Authors of “Ready-Money Moribond.” 3 vols. London: Tinsley Brothers. 1873.

his opuscula, "which will one day be eagerly bought by an admiring public," and the education of the grandchild of his drunken laundress. "This little rosy-cheeked damsel of six had touched his soft heart with pity"; he had nursed her through a fever, he had taught her her letters, had made her a good scholar, and as perfect a lady as a girl can be whose education had been carried on solely by a gentleman. At the time the second part of the story opens she was eighteen years old, and Venn was beginning to see with alarm that the old relations in which they stood could not long go on. The girl Laura Collingwood lived a life of such entire seclusion that she herself never dreams of any suspicion of impropriety. Her innocence is happily natural enough; her ignorance, and it is on this ignorance that the story turns, is surely impossible. Had she been brought up by Venn alone she might have been, as it is represented, in utter ignorance of marriage. But she lived with her grandmother, a pilfering, drinking old woman, in a low court, and must, stainlessly pure though she might still have been, have heard enough to guard her against the troubles into which she is led. Venn, who knows how deeply he loves his Little Girl, but hardly as yet suspects that he is beginning to love her as a lover, tells her that he shall be happy if he can only see her married to some gentleman. He often repeats this to her, till she, in her wonderful simplicity and utter ignorance of what marriage is, begins to think it is her duty to get married. At this moment a stranger, Philip Durnford, who by this time has become a captain in the army, protects her from some rudeness offered her in the streets. He falls in love with her, and, after a few more meetings, offers to marry her. She, without really caring much for him, but seeing that he is a gentleman, thinking to please her guardian, accepts his offer. Philip binds her over to secrecy; but the evening before the day fixed for the marriage, overcome by doubts, she would have told Venn, her guardian, everything, only, in the full trust he had in her honour, he would not listen to her secret. Meanwhile Philip had recognized the scoundrel MacIntyre bearing advertising boards, or "sandwiches," as they are called, along the streets of London. For the first time for many a year the fellow had, as a boardman, an honest culling, for, as he himself said, "It is one of the advantages of the profession that you must be honest, because you can't run if you do steal anything." Philip supplies him with money, and MacIntyre becomes his evil genius. He persuades him to take advantage of Laura's utter ignorance of the world, and to play on her the same trick that Squire Thornhill, in the *View of Wakefield*, tried to play on Olivia. He was a Master of Arts of Aberdeen, and, to satisfy the scruples Philip still felt, half-hinted that he was in order. Philip carries off Laura to France, and first reads and then destroys all the letters she writes to her guardian. On his return home he takes to gambling, and quickly loses all the money he had. The book here, to our mind, becomes very dull. The author himself is aware of it, and thus apologizes for it:—

To him who is initiated in the mysteries of the turf my narrative will be intelligible, but probably uninteresting, for it is a tale he knows by heart. To the uninitiated this chapter must be to a great extent unintelligible, therefore uninteresting.

Surely what the writer calls "the exigencies of his history" cannot require him to fill thirty pages with the slang of the race-course, any more than the painful duty which they had to perform required the newspaper correspondents, some years ago, to fill two or three columns with an account of the first private execution. Philip is ruined by gambling, and drives Laura out of his house, first telling her the trick he had played her. She, after twenty hours' wandering through the streets, is found by a poor girl whom she had once befriended, and is taken to her lodgings. There Venn comes, and learns everything. Meanwhile MacIntyre had told Philip that it was he, and not Arthur, who was the legitimate son, and heir to the property, and had shown him a duly attested copy of the forged register. When Arthur saw the proofs he at once gave up possession, and though he more than suspected that they were forged, so anxious was he for his father's good name that he would not allow the case to be brought into court. MacIntyre received 5,000*l.* from Philip as his reward, and with this he retired to a life of great respectability in Scotland, having first been most mercilessly thrashed by Hartley Venn. At this moment Marie, Philip's mother, comes upon the scene, and admits at once that the proofs are all forged, and that she had never been married. She and Madeleine together, who also turns up, have influence enough over Philip to persuade him to go through the form of a regular marriage with Laura. At the church the husband and wife part, never to meet again. Philip goes on drinking, sees skeletons sitting by him, and at last hurries off to his estates in the island, for he still keeps them, to see what a sea voyage will do for him. He drinks harder than ever, till, as we have said before, he kills himself off. His mother, who had made her will, leaving all her property to Laura, meets her end with much sublimity in the wreck of an ocean steamship, and in due course of time Hartley Venn marries Laura. Arthur had some while before married Madeleine. Lynn gets a judgeship in Trinidad, and Jones has his play brought out at the Lyceum with all the success that the management could devise. The three members of The Chorus become successful, and the Club is dissolved.

The plot of the story is certainly very extravagant, and some of the incidents are offensive while others are dull. Nevertheless the book has considerable merits, and, except when on racing matters, or on penitence, is lively enough. The talk of the Club

is so amusing that it would almost reconcile one to want of success. Venn's account of his Eton days is comically told. It is much too long to quote, but the following passage is a fair specimen:—

"Jones, you were never flogged."

"I was not," said Jones. "If it is any extenuation of my master's crime, I may mention that he often caned me."

"I knew it," Venn returned, with an air of triumph. "There are subtle influences about the older and more classical instrument. It produces an effect which in after-life is only to be detected by those who have made an early acquaintance with it. Caning is merely a brutal mode of inflicting fear and pain. The poetry of punishment is in the birch. The actual performance, I admit—the mere physical process, either active or passive—affords little food for reflection. But when I think of the effects upon the sufferer, I am carried away, gentlemen, effused. There is the Anticipation, so full of tumultuous fears and hopes, and its certainties as to the future fact, and its uncertainties as to vigour and duration; its bracing influence on the Volition, its stimulating effect on the Fortitude, its cultivation of patient endurance. All this, my friends, is truly poetical. Consider, next, the After-glow. The After-glow is, indeed, a magnificent combination of sensations. Nothing that I can remember to have experienced comes near it. It lingers like the twilight; and, like the summer twilight, it lasts all night. It warms like the memory of a good action, or the blush of conscious virtue. It is as soothing as the absolution of a bishop. It removes as many cares as a confession, and it wipes off sins like a pilgrimage."

We hope that the next time our authors write they will know of no exigencies but those of good taste, and that they will leave all racing matters and racing slang to the sporting newspapers.

HANDBOOK TO THE CATHEDRALS OF WALES.*

MR. KING, who puts his name to the preface, has now completed his useful series of the cathedral churches of England and Wales. The present volume, which contains the four episcopal sees of the Principality, is, like those which have gone before it, carefully and accurately done, with constant reference to the latest and best lights on the subject, including of course the one trustworthy guide to Welsh ecclesiastical history, Mr. Hadden's first volume. The book will serve to bring a great deal which Mr. Hadden and other scholars have worked out before a wider circle of readers than they are likely to find in their own persons. In this way it will serve to remind the visitor and the merely architectural student that a church or other building is not only a building, but that, even as a building, and still more as a foundation, it fills a place in history. We should ourselves have been better pleased had the history and the architecture been made more constantly to bear upon one another; but the arrangement which is actually followed is perhaps better suited for actual use as a handbook on the spot.

It is characteristic of the present age that Mr. King has been hindered from giving some further illustrations of the churches which he describes owing to the scaffoldings set up for the restoration of the buildings, which make it impossible to take all the views that he wished for. Whatever may be thought as to restoration generally, whatever may be thought as to some particular points in the restoration of these four churches, it cannot be denied that some restoration was needed by all the cathedral churches of Wales, if they were to go on and discharge with decency even their functions as ordinary parish churches. To one who knew Llandaff five-and-twenty years back and who sees it now, the whole thing is like a rising from the dead, and St. Wulfstan could not complain that nothing has been done but to pile together dead stones or that the lively temple has been neglected. At St. David's again, though the church had not become, either in its fabric or in its foundation and services, so utter a wreck as Llandaff, there was no choice but restoration if the building was to be so much as kept standing. In the two smaller churches of North Wales restoration was not needed on this ground, but rather on the more usual ground of getting rid of modern disfigurements and bringing back ancient forms and arrangements, which had been hidden by modern changes, but which could still be made out. To one who, like ourselves, knows Bangor only in a very different state, its appearance in Mr. King's illustration is simply startling.

The four Welsh episcopal churches, though very unlike one another in their appearance, have some points in common. All are churches of the Old Foundation, though their foundations are mostly small and imperfect. St. David's and Llandaff, for instance, remained for many centuries without Deans, and Llandaff till our own time had no special Residentiaries. All four are of small size as compared with the great churches of England and France; St. David's is the only one of the four which carries out the received type of a minster in any degree of perfection. That is to say, partly no doubt through the poverty of the country, but partly also through its traditions, the fashion of building churches of enormous size, which the Norman Bishops and Abbots brought into England, never spread into Wales, any more than into Scotland or Ireland. The greatest churches, cathedral and abbatial, in all three countries rank in size far below the great English churches, and many of them, in all three countries, fall far below English churches of the second rank. Again, as Mr. King remarks, three of the four Welsh episcopal churches stand low in point of site, and this he contrasts with the position of the same class of churches in England. But he might have noticed that, though no English church lies down in quite such a hole as Llandaff or St. David's, yet the eldersites of the English bishoprics were most of them

* *Handbook to the Cathedrals of Wales. Llandaff—St. David's—St. Asaph—Bangor.* With illustrations. London: Murray. 1872.

low as compared with the churches which crown the highest points of the Gallic cities. The lofty sites of Durham, Lincoln, Exeter, and Old Sarum are all due to later changes, and in the case of Old Sarum the lofty site chosen in the eleventh century was in the thirteenth exchanged for one more like the ordinary site of an English bishopric. Both in England and in Wales the difference is doubtless due to the circumstances of the country, to the circumstances of bishoprics planted among a people who, when they had any towns, did not, like the inhabitants of the Continental Roman provinces, make them the centres of their whole political and social life. No one on the Continent would have chosen Lindisfarne or St. David's as a place for an episcopal church.

Another point of distinction is that, while, as a rule, the English cathedral churches are not strictly speaking parochial—that is, excepting the new foundations of Ripon and Manchester, they have no parish attached to them beyond their own immediate precinct—three of the four Welsh episcopal churches are also the parish churches of large parishes. St. Asaph alone, the smallest of the four, is the only one which has a separate parish church for the use of the little town. The parochial character of the other churches, combined with the existence in most cases of two languages in the district to be provided for, has always been a difficulty, and one which has been a fertile source of those untoward arrangements of these churches which it has been one main object of later changes to get rid of. At Llandaff alone the difficulty has been solved by the universal spread of English through the parish and neighbourhood, so that there now is nothing to hinder a single congregation from attending the English cathedral service.

In going through the history and description of the churches of Llandaff and St. David's, Mr. King has walked closely in the steps of the latest inquirers, following them up with the history of the changes and discoveries which have been made since their time. In the case of Llandaff he has to record the completion of the fabric, which has been so wonderfully culled up out of a state of ruin and chaos, and which, with some obvious faults, is certainly one of the greatest works of its kind in our day. Mr. King is more tolerant than we can profess to be towards the new roofs, towards the reredos copied from a Westminster tomb, towards the queer top given to the chapter-house, and towards the spire, a fine thing in itself, but which seems to have swum round about from Bayeux, as its older fellow certainly swam across from Somerset. Mr. King agrees with the suggestion that the original design of this church—or rather not strictly the original design—but the design of those who enlarged and transformed it in the thirteenth century was to have, like so many German churches, a pair of both western and eastern towers, though they were not meant as commonly in Germany, to flank an apse at each end. Llandaff, it should be remembered, is the only original cathedral church in South Britain—one of the very few great churches of any kind—which never had, or was meant to have, either a transept or a central tower in any shape. At St. David's Mr. King has to record considerable changes, above all, the strengthening of the great lantern piers, and the restoration of the upper window of the presbytery to its original form, one of those changes about which there will be always differences of opinion. Here Sir Gilbert Scott has got rid of the great Perpendicular window which had displaced four lancets, and has got the lancets back again; but he has kept and repaired the roof which agreed with the Perpendicular window, but does not agree with the lancets. Mr. King's engravings bring out strongly the features of that wonderful nave, where the rich work of the twelfth and of the sixteenth century so strangely harmonize, and he goes minutely into the history of the aisles and chapels, some of which are now happily roofed again. Late discoveries have brought to light a singular recess behind the high altar, which was found filled with human bones, bones which are conjectured to be those removed from the shrines of St. David and St. Caradoc.

The two North Welsh churches are in every respect inferior to those of the South. This is of course owing to the fact that South Wales came so much sooner under regular English rule, so that, at the time when their churches were built, the districts in which St. David's and Llandaff stood were not very much more disturbed than England in general. North Wales meanwhile went through the wars of the thirteenth century and those which followed on the insurrection of Owen Glyndwr. In these last the bishoprics and their churches specially suffered, and Bangor, above all, remained a ruin till near the end of the fifteenth century. The bishoprics were poor and were commonly held in commendam with some other preferment. The natural result is to be seen in two churches so small and plain as altogether to amaze those whose notions of a cathedral church are formed on an English or Northern French standard. But St. Asaph and even Bangor would quite hold their own in Ireland, and would not be altogether contemptible in Scotland. Neither of them, as they lately stood, had at all the character of a minster, and the original work, in many parts very good, had been much hidden and disfigured by later changes. St. Asaph is the smallest of all, yet the massive outline of this little cathedral is certainly one of the most effective to be found among churches of its own scale. The inside has been thoroughly cleaned out and refitted, but we trust that the hideous plaster ceiling of the nave, which hides the small and graceful clerestory, may soon be got rid of. But it is at Bangor that Mr. King has to record changes of modern times which are only less amazing than those which have been wrought at Llandaff. As Bangor Cathedral stood before the late restoration began, it was a church much larger than St. Asaph, but in every

other respect altogether inferior to it. St. Asaph, a small cross church with a central tower, belonged to a type which can better dispense with ornament than any other, and which, whatever its actual date and style, always keeps something of Romanesque solidity about it. Bangor, on the contrary, seemed to be only a long low church of poor and late work, with the worst possible outline, transepts crying in vain for a central tower, while the single western tower was so low as to give no kind of dignity to the building. It was easy however to see that something better had once been or been meant to be, that a central tower was at least designed, so that the church was meant to have the same outline as Purton and Wimborne Minster on a small scale, as Ely and Wymondham on a great scale, as Hereford, Shrewsbury, and Malinesbury as they once were. This arrangement with the two towers one in front of the other has been by irreverent minds likened to driving tandem, just as the side towers of Exeter and Ottery have been likened to a paddle-steamer. Sir Gilbert Scott has made out the former design of the transepts, and both they and the choir with their high roofs now soar far above Bishop Sherington's low-pitched nave. The inside, as shown in Mr. King's view, is now really stately, instead of being, as we remember it, about as mean as it well could be. We certainly hope that the central tower and spire will not be carried up to the amazing height which is shown in the engraving. At present the tower has only reached the roof-line, and we would strongly urge that one stage above it with a lower spire would be quite enough. Low and plain as the western tower is, still there it is the chief feature of the church, and its new comrade ought not to throw it into utter insignificance.

We congratulate the author and publisher on the completion of this useful series. We could sometimes wish in it for wider general views, and for a bolder spirit of criticism of works both old and new. But it is well suited for its own purpose, and it is a great improvement on anything of the kind that went before it. It is a great thing to be thoroughly trustworthy, and to be quite free from all nonsense and twaddle. We should be glad to see the series extended to some other of our great churches which are not of cathedral rank, and about which people often seem yet more in the dark than about those which are.

GREEK NUMISMATICS.*

IT is now nearly a century since Eckhel in his *Doctrina Numorum Veterum* traced with a master-hand the outlines of numismatics so far as regards the ancient world. This great work was a complete digest of all that had been written on the subject of Greek and Roman coins up to Eckhel's time; but since its publication the study of ancient numismatics has been greatly developed, not only by the discovery of many new coins, but by a prolific crop of treatises to which these discoveries have given rise. The time seems now to have come for a second Eckhel to arise; some one with sufficient judgement, learning, and industry to extract the pith of these various treatises, and to work them into a new digest embodying all the most recent results of numismatic discovery.

Why this task, which seems so suitable to the omnivorous activity of Germany, has not yet been accomplished, or even attempted, it is not easy to explain; but doubtless one principal impediment to the study of ancient numismatics is the want of catalogues of the great public collections, except such as are now comparatively obsolete. Up to this year, for instance, all the published information with regard to the magnificent collection of Greek and Roman coins in the British Museum (if we except stray memoirs and notices) was comprised in the Catalogues by Taylor Combe and R. P. Knight, of which the respective dates are 1814 and 1830, and which embrace not above a fifth part of the collection as it now is. It is therefore with great satisfaction that we note that the Department of Coins is at length making an effort to redeem these long arrears. The first volume of a general catalogue of the Greek coins in the Museum, by Mr. Poole, has appeared, and a second volume is promised shortly.

Eckhel, in his *Doctrina*, adopts a geographical arrangement of his subject, traversing the Mediterranean from west to east. The fault of this arrangement is that the semi-barbarous coins of Spain and Gaul, where Greek civilization was only sporadic and comparatively recent, are presented to the student before he has been introduced to the true sources of Greek numismatic art. The arrangement adopted in the Museum Catalogue is preferable, inasmuch as the series begins with Italy, to be followed by Sicily, two countries in which the history of Greek numismatics, from a very early period of their civilization, can be traced with greater exactness and continuity than in any other part of the Hellenic world. In the volume before us the coins of Italy are all classed under the general heading "Greek"; but it would be more exact to distinguish in this class the coins of pure Hellenic settlements from others in which Etruscan, Oscan, or Roman influence is apparent both in the art and the weight and standard, so that these coins may be roughly divided into Greek and Græco-Italian. If we draw a line across Italy from the mouth of the Volturnus on the west coast to that of the Aufidius on the Adriatic, it will be found that nearly all the early colonies made by the Greeks in Italy lie south of this line. The centre of Italo-Greek civilization is the fringe of shore

* *A Catalogue of the Greek Coins in the British Museum. Italy.* London: 1873.

between Tarentum and Reggio, known in antiquity as Magna Græcia, and now comprising part of Calabria and the Abruzzi. It was in this fertile and genial region that Greek numismatic art began to develop itself from a very early period. The principal settlements on this coast, such as Tarentum, Metapontum, Sybaris, Oron, were founded at various dates ranging from B.C. 750 to B.C. 650, and it is probable that the colonists brought with them the then newly-invented art of coining money. Hence the archaic coins of the cities of Magna Græcia have a special historical interest, especially when, as in the case of Sybaris, the known date of the destruction of the city and its consequent change of name enable us to fix the date of its coins with certainty to the period between B.C. 720 and B.C. 510. The coins, again, of Siris must have been struck in the same period, as its destruction preceded that of Sybaris. These archaic coins of Magna Græcia have a local peculiarity of fabric which distinguishes them from the other early coinages of Hellas. They are struck, not on lumps or nuggets, like the early gold coins of Lydia and the silver coins of Athens or Aegina, but on thin discs, the type being raised in relief on one side and repeated in intaglio, or, as numismatists say, *incuse*, on the other. This local peculiarity of fabric points to some early confederation of the cities that adopted it. In some few instances the types of two cities are combined on the same coin, in token of an alliance. As art advanced the incuse repetition fell into disuse, and a second type, in relief, was substituted for it. This change probably took place about the beginning of the fifth century B.C., in the course of which the confederacy of Achæan cities was annihilated by an invasion of the Lucanians. Some of these types are of peculiar interest as archaic representations of deities, in some cases perhaps actually copied from statues. Thus, on the coins of Poseidonia (better known to tourists under its Roman name, Paestum) we find Poseidon; Tarentum commemorates its mythic founder, Taras; and on coins of Kaulonia is a male deity, probably Apollo, holding a little running figure in his hand, a type the interpretation of which has perplexed numismatists.

As Greek art matures, it is interesting to trace its stages in the coins of the cities of Magna Græcia, whose civilization, somewhat prematurely developed, seemed to have reached its highest point a little before the Persian war. In forming an estimate of the relative political importance, wealth, and refinement of these cities, coins furnish some valuable evidence in supplement to the scanty notices in ancient history. Thus we learn from the Catalogue before us that the British Museum possesses 441 silver coins of Tarentum, 140 of Neapolis, 162 of Metapontum, 123 of Thurium, 116 of Velia, 108 of Oron. Of gold coins, Tarentum has thirty-two, Metapontum one; but the Catalogue assigns no gold coins to any other city in Magna Græcia. These numismatic statistics are borne out by history. We know that Tarentum and Metapontum were cities of great power and wealth from the first, and that they retained their political importance after most of the other cities of Magna Græcia had succumbed either to the Sicilian Dionysius, or to the inroads of ruder Italian races. The gold coinage of Tarentum is evidence of its wealth, which it owed partly to the richness of its products, both terrestrial and marine, but still more to the excellence of its landlocked harbour, and to the convenience of its situation as an *entrepôt* for the commerce of Greece and Egypt. The Tarentines were celebrated for their breed of horses, and in the art of the *manage* their skill was proverbial. On the splendid series of their coins in the British Museum we see this type of the Tarentine horseman repeated with a vivacity and endless felicity of invention almost worthy of the frieze of the Parthenon. In the execution of these coins there is an elaborate refinement reminding us of the art of the gem-engraver. The best of them were probably struck not long before the time of Alexander the Great.

We can only glance here at the coinages of the other cities of Magna Græcia, among which will be found some exquisite specimens of numismatic art, and especially at Terina, Oron, and Thurium. It is at Terina more than anywhere in Italy that we get on the coins that freshness and simplicity in the design which we usually associate with the school of Phidias. The coins of Heraclea, Neapolis, and Velia are later; their style is more effeminate and mannered, like that of the later fictile vases and terracottas of Southern Italy. The abundant coinage of Metapontum is deficient in variety of types. The predominant subject is a wheat-ear, a symbol of that fertility which led the Metapontines to dedicate a golden sheaf at Delphi.

Of far less interest are the coinages which we have designated as Græco-Italian. The principal classes comprised under this head are the copper coins commonly known as *æ grave*, struck in Etruria, Umbria, Latium, and other provinces of Central Italy, and the Græco-Roman coins of Campania, Apulia, Samnium, and Frentani. Under this head may be classed the coins with Samnite or with Oscan inscriptions, which occur here and there in Campania, Apulia, Samnium, and Frentani. Most, if not all, Græco-Italian coins (whether *æ grave* or Græco-Roman) were probably struck after A.D. 300, as the Romans began to extend their empire into Etruria and Campania. The system of the weight of these coins has been very thoroughly investigated by Mommsen, whose theory is generally followed in this Catalogue. It was the characteristic of the indigenous races of Italy from very early times to employ copper, a metal which abounded on their soil, rather than gold and silver, as the instrument of commercial exchange. Hence the word *æ grave* originally expressed the worth of anything in copper. At first bars or lumps of this metal, *res rude*, were used. It is not till A.D. 450, three centuries after the

founding of Rome, that we get any evidence of the use of coined money, *æ signatum*, at Rome. This was probably introduced by the Decemvirs, in whose laws fines are ordered to be paid in coin. The coined copper money of the non-Hellenic races of Italy consisted of the *æ* (originally equal to a pound of copper), and its subdivisions down to the ounce, *uncia*, and onwards. All this money is known as *æ grave*—i.e. money which was reckoned, not by tale, but by weight. The specimens which have come down to us are nearly all probably as late as A.D. 350, when the *æ* was greatly reduced in weight. As instruments of traffic nothing can be clumsier than these great lumps of metal, and as works of art they present a painful contrast to the beautiful coinages of Magna Græcia. The Museum has a very fine series of *æ grave* from Etruria, Umbria, and Central Italy, including some of the curious oblong ingots of great weight, which, though their form suggests a primitive origin, have no claim to a higher antiquity than the rest of the *æ grave*. These copper coins are cast, not struck. As the commercial intercourse between the Greek colonies of Magna Græcia and Sicily and the non-Hellenic races of Italy extended, it was necessary for the Greeks to adjust their standard, based on a silver currency, to the Italian standard, based on a copper currency, and how this was done has been traced by Mommsen with great skill in the coinage of certain Greek cities, principally in Campania and Apulia. But this is too intricate a subject to be dealt with here; ample materials for its study are to be found in Mr. Poole's Catalogue.

In the survey of Italian numismatics the question naturally presents itself, Had the great Etruscan cities in the time of their independence a regular silver currency, such as we find from a very early period throughout the Hellenic world? The only silver coins of Etruscan cities known to numismatists are the curious series from Populonia, struck only on one side, of which the Museum possesses twenty-six, and a very few quaint varieties struck by unknown Etrurian mints, of which we find only six in the Catalogue before us, one being evidently a very ancient coin. It seems probable from these statistics that a silver coinage was adopted by the Etruscans only in those maritime cities where commercial intercourse with the Greeks made such a currency convenient, and where Greek settlers formed an integral part of the population. Mommsen thinks that the coinage of Populonia may have been derived from that of Athens, with which city the Etruscans had very early commercial relations.

We have given here a sketch of the numismatics of ancient Italy, the correctness of which can be best tested by the study of such a Catalogue as we have before us, in which the classification according to mints and types has evidently been made with great care, and in which the tabular arrangement gives greater facility of reference than the arrangement in Mionnet's *Recueil*. The spaces allotted for the description of the coin are, however, too narrow for perspicuity; and it is to be hoped that this fault will be remedied in future volumes. The text is illustrated with fairly executed woodcuts of certain coins, not previously engraved; references in other cases being made to the *Museo Kroheriano* and to Carelli's Plates. But looking over the volume, we observe a certain capriciousness in the selection of the coins to be engraved which it is not easy to account for. Why, for instance, should we have not one cut of the beautiful coins of Thurium or of the interesting archaic coins of Kaulonia, Siris, Sybaris, &c.? It would have been better to have limited the cuts to the principal types and to very rare and unedited coins.

In this Catalogue the description of the coin is not accompanied by any commentary. This we think is wise—*bis dat qui cito*. It is something to have given us here an accurate classification and description of nearly four thousand coins of Italy. To write a sufficient commentary on these would be a work of years; and this is not so specially the function of the Keeper of a Museum as to print catalogues of what he has in his charge. But it must not be forgotten that a really scientific catalogue can only be made by bringing to bear on it the accumulated knowledge of a life devoted to a special study; and what renders the labour of cataloguing somewhat distasteful to all except those who are altogether destitute of literary ambition is the feeling that this knowledge is latent in their work, and that its recognition, like that of the labours of lexicographers, is apt to be tardy and scant. For the due advancement of the study of ancient numismatics, as indeed of every other branch of archaeology, we want not only scientific catalogues, but popular treatises based on such works.

We observe that an attempt has been made to render ancient numismatics more accessible to the general public by the exhibition in the Gem Room of the Museum of a set of electrotypes of Greek and Roman coins geographically arranged, and by the publication of a guide to this exhibition in which sound numismatic lore is stated in an unpretending manner and in a small compass. But we hope that this exhibition of electrotypes will be greatly amplified, and that the little guide will grow into a compact handbook, embodying the results of the Catalogue as successive volumes appear. We trust that now that a fair start has been made, this Catalogue will be pushed on with all the force which so great an undertaking demands. It is said that the British Museum contains not less than 60,000 Greek coins. In that case, the volume before us represents hardly a sixteenth part of the whole work.

TOO SOON.*

SOME men, less complimentary than sincere, say that it is women, not the other sex, who make love in the beginning of things, that coining prefaces pursuit, and that Joan is willing while John is shy. Apparently Mrs. Macquoid shares this opinion; for her heroine Ursula, at the ripe age of eighteen, shows an amount of unsought passion for the grave, massive-limbed Michael Helder, and suffers herself to fall in love with him in a headlong manner, that says more for the frank development of her instincts than for the modesty and maidenly pride usually characteristic of a well-conducted girl. In our quality as critic of light literature we are often gravely exercised to discover for what possible purpose, ethical or æsthetic, authors construct their stories. For artistic perfection? for the graces of literary style? for the representation of a beautiful humanity? for the pleasure to be derived from a vivid representation and dramatic rendering of life? Any one of these is sufficient reason why three volumes of honest paper should be covered with legible type, and a man's spare time be given to a pleasant perusal of an enlivening or ennobling history. But when we cannot find one of these reasons, then we confess we are perplexed, and feel our burden of critical analysis heavy.

For instance, what end worthy of a reasonable creature could Mrs. Macquoid possibly propose to herself in this book which she calls, affectually enough, *A Study of a Girl's Heart*? Take its obvious moral, "Don't marry on too short an engagement"—and what does it prove beyond the patent fact that Ursula was more ill-tempered and foolish than, we trust, most sane English girls are, and that every one concerned was nearly as ill-tempered and foolish as herself? Hurried marriages after short engagements are dangerous things at all times, and confessedly increase the chance of an unlucky draw in a lottery where, under the best conditions, there is a fearful proportion of blanks; but the most hurried marriage need not turn out so badly as did this of Ursula Williams with Michael Helder in the beginning of things; and none but creatures of exquisite silliness would have allowed such trifles as those which govern the people of *Too Soon* to have regulated or destroyed their happiness. The whole story is a tempest in a teapot, and all the pellets are made of bread crumbs. A chance word or a momentary glance is quite sufficient provocation for the personages of this absurd region to go off into paroxysms of rapture or despair, as the case may be, and bring consternation and bewilderment on every one around. Ursula is the heroine, and in her character of *femme incongrue*, as well as of enthusiast and poet, is of course the most upsetting and excitable. She gives no one any peace; and we must confess that we think all those who have her in hand are to be profoundly pitied, and that her physical charms, which, although we are expressly told "she is not beautiful," must have been considerable, would in no way have compensated for her want of sense, and her want of good temper, nor have made her exaggerated sensibilities more endurable.

Between those dreadful creatures who dishonour all that is noblest and best in womanhood by their attempts to make themselves bad copies of men, and those impersonations of inanity who, under the name of sensitiveness, dignity, ladyhood, and the like, render everything that is sweetest sickly, everything that is tenderest contemptible, the ideal type of womanhood seems to be passing out of existence like the dodo or the moa. And our novelists do not help to retain the standard. One day we have the apotheosis of moral deadness and intellectual imbecility, combined with fine eyes and a smooth skin; another that of an angelic patience which puts the virtues of the legendary Griselda to shame, and a persistent humility in offering the cheek to the smiter which we are not ashamed to confess discredits more than it edifies. Again, by way of contrast, we have some unhappy wives who have the misfortune not to admire their husbands, and who therefore accept as consolation the fervid love-making of their old adorers with a forgetfulness of the marriage service and the outworks of the Seventh Commandment that may be scrupulous in intention, but is decidedly dangerous in action; while their sisters are young maidens who fall passionately in love at first sight with brawny heroes who have apparently nothing to recommend them but a fine physique and undisguised sensuality. We suppose there is nothing for it but to wait patiently until the crase for what is virtually a caricature of human nature has worn itself out. Meanwhile we must speak of things as we find them, and when we come across such a mass of absurdity as *Too Soon* we must not be too nice in speaking the truth.

The chief personages of this book consist of two pairs of cousins, the older and more substantial of whom are Rachel Fraser and Michael Helder, living in a fine old house with a well-staircase, near Bloomsbury Square; the younger and frothier are Ursula and Frank Williams, the former of whom lives with her father and Aunt Sophy at Brompton, where they have a garden, and where the latter comes to see, teaze, and make love to her. Though only cousins, Rachel and Michael live together now in mature age as they have lived together through all their youth. Ever since he was ten years old and she twenty she has kept his house for him; and she keeps house for him still, worshipping him after the manner of women, occasionally dusting his books, and surreptitiously putting his study "to rights." This somewhat anomalous position the author conceives to be quite possible, because the lady is ten years older than the gentleman. But this is a difference of age between

handsome people of opposite sex and a slight relationship which would not have been considered a sufficient guarantee, we fear, to have kept the name of the respectable Rachel from local gossip. Be that however as it may, Miss Fraser is rather an awful kind of person, strong and firm and self-controlled as becomes a handsome maiden lady of middle age who dresses in black silk and does not wear a cap; and she is evidently sufficient for herself, and able to cope with her enemies, if she has any. Mr. Helder is something in the British Museum; exact position not specified. We presume he has something to do with the archaeological department, as he is the colleague of an "old fossil," as Ursula disrespectfully calls one Mr. Haven who croaks about Sanchoniathon and enters into "fearfully long discussions about Nisroch and eagles' wings." He cannot, however, be very hard-worked in his department, whatever it is, as he is able to remain for two hours on the first occasion of his seeing Ursula, sitting on a bench perhaps in the Elgin Marble room, at all events somewhere about there, telling her of his travels, and getting "a better view of the changes of the girl's sensitive face, as now the well-marked eyebrows, now the delicate nostrils, now the flexible mouth came into play and aided the meaning of those wonderful dark eyes." "Those wonderful dark eyes," indeed, make half the *signalment* of Ursula, and her curved mouth makes up the other half. The former are always flashing, or sparkling, or dancing, and the latter always curling, or parting, or pointing, or smiling, no matter what the insignificance of the occasion. It is a fatiguing kind of face, ever making much ado about nothing; as when she listens to Mr. Helder's account of Rome and Florence with "parted lips," a "flush kindled on her cheeks," her eyes "vivid questioners," and feeling "entranced by happiness."

This introduction to Mr. Helder destroys what little sense Ursula might have had before. She falls in love with him, *à la barinée*, and he is gently warned towards her; and after a brief period of the inevitable worn in the bud which feeds on her damask cheek and paints black rings round her eyes, the lovers come to a happy understanding under a tree in the Brompton garden, and are engaged. Business calls Mr. Williams to Italy, and Ursula has her choice, either to marry at once or leave her lover behind and go with her father to Italy. She marries at once; which is the "too soon" that gives its name to the book. Not that any amount of preparatory time or schooling could have done much towards rendering her capable of undertaking a rational life. Being of the tribe of the foolish, she has to sow her silliness, as young men are said to sow their wild oats, and to eat of the fruit thereof before she can be cured of her faults. She of course hates Rachel, and Rachel is naturally not behindhand in returning the compliment. Michael tries to make the women friends; but the one is antipathetic and the other insolent; so they kiss coldly and hate each other cordially. In due time the Helders give a dinner, which Ursula orders, and whereof roast lamb and a ham are the two principal dishes; and this makes a breach between the married lovers. Then Michael has to go to Scotland on business, and Ursula is wholly offended because he goes, and he is half offended because she does not show she is sorry to part from him. And while he is away her father telegraphs to her from Italy that Aunt Sophy is dying, and she is to go over at once. Rachel, who has come to keep the young wife company during her husband's absence, opposes this journey, and Ursula insists on it; the elder lady urges the well-worn platitudes about wifely duties, and the virtue of obedience, and the righteous disruption of all former ties as soon as you are married—with "marriage is not slavery," and a father's wish is always law, as the antistrophe from Ursula. It ends by Ursula's going, and by a total estrangement—no one knows how or why—from her husband in consequence. They cease to write to each other, each thinking the other indifferent; and after Ursula has been nursed out of a fever by Rachel, who goes to Italy for that purpose, and has come back to England, without assigning any reason she declines to go to her own home, and Michael does not press her. She pouts thus for some weeks, spending part of the time with her old friend Cousin Frank, now married to an amiable, unintellectual girl who does not write poetry, and continually thanking his good fortune that he did not marry Ursula, and with reason. Then she suddenly goes back to Michael and Bloomsbury, and sees her husband looking pale and thin with his arm in a sling; on which they rush into each other's arms, kiss, and make up. This salutary change in her mood has been brought about, be it understood, by the sight of the gown worn by poor Aunt Sophy at her wedding, which acts like a mirror wherein she sees "the leprosy of self-love that covers her whole soul."

Sermons are in stones, we know, so why not in old clothes? So long as a person of Ursula's morbid temper and absurd sensitiveness can be brought to reason, it does not really signify whether it is by a gown or a preachment, a drum or a fever. But we confess we do not agree with Mrs. Macquoid in her presumable estimate of the possibilities of conversion. Nothing but time and strong outside influences could have modified such a character as Ursula's, and conscience, like everything else, is a matter of training and growth. This woman, who would have gone so near to make shipwreck of her whole life for an absolute nothing, would not have been so suddenly transformed from a petulant fool to a self-controlled saint. Petrusio conquered Katherine by brute force and absolute fear; but Ursula, who is in her way a weaker, more sentimental kind of Katherine, grows into meekness by a bound, and with no outside pressure at all save reminiscence and an old gown. The whole book is pitifully weak, both in subject and treatment, in psychology and art. It is

* *Too Soon; a Study of a Girl's Heart.* By the Author of "Patty," &c. 3 vols. London: Richard Bentley & Son. 1873.

fantastic, threal, and yet commonplace and essentially vulgar in its central idea. It is a scrawl, not a neatly-written page of possible human history; and it has but one merit, that of being widely printed, and consequently very easily run through. We are sorry not to be able to speak better of Mrs. Macquoid's work; but what can be said of a novel which is weak and unreal as a picture of human nature, and without even the merit of technical skill?

BURCKHARDT'S CICERONE.*

MRS. CLOUGH has done good service by this translation of Dr. Burckhardt's *Cicerone*, a work which, as she truly says, "bears the highest reputation in Germany as an authority on the history of art." The original Handbook comprised architecture and sculpture as well as painting, while this English version treats of painting only. We shall look forward to further instalments of this valuable contribution to the literature of the Fine Arts. The arrangement of the treatise is not by localities, but by periods and schools; thus the chapters range from antique and mediæval painting down to "the Eclectic and Naturalistic schools" of the seventeenth century. The style is disquisitional; the basis of criticism is "the absolute"; the reader feels himself in the presence of an "æsthetic sense" rather than of hard historic facts, and in vain he searches for biographic details. Thus there is no mention of Giotto having been taken from the sheepfold by Cimabue, and the oft-repeated story of the elopement of Fra Filippo Lippi with a nun is neither affirmed nor refuted. But, as a compensation for the want of such sensational incidents, we are treated with the following piece of strictly subjective criticism. We might perhaps have better appreciated the ideas if the construction of the sentences had been a little neater, but German writing is defiant of form. Under the head "Filippo Lippi" the passage to which we refer runs as follows:—

The advance made by Masaccio is carried still further by Fra Filippo Lippi (1412?—1469), under the guidance of a less high and severe mind, but a rich and playful fancy. He lets himself go, but not through laziness, but rather in audacious experiments in what may be allowed to art. With what freedom and openness he reveals to us in the figures with which he fills up his scenes, the deepest nature of those whom he conceived, with what feeling he represents—the first to do so—the conscious loveliness and exuberant, even wild, playfulness of youth! He is the first who heartily enjoyed the fulness of life, even in its chance manifestations.

English readers have been made familiar with German critics of two kinds. The one, whereof Dr. Waagen is the type, is dry and laborious, matter of fact and unemotional. The other, of which Professor Kugler is the best known example, indulges in sentiment and falls into rapture. To the last class belongs Dr. Burckhardt, and yet with this difference, that in his more recent development of the manner there is a greater show of philosophy. The method has at once the weakness and the strength which inhere to subjective criticism. Art is not brought to the test of external laws; it is not measured by fixed standards; it is scarcely viewed as a physical existence at all; the relation between geometry and art composition, the bearing of spectrum analysis on pictorial colour, even the connexion of anatomy with the human figure or of geology with landscape, are wholly or in great degree ignored. But instead of an examination into the structure of the earth, which Mr. Ruskin has occasionally made the basis of his criticisms on landscape art, Dr. Burckhardt trusts to his intuitions. Thus he is content to speak of Claude as a "finely attuned soul who hears in Nature the voice which is especially qualified to console the human race and repeats her speech." Again, when we turn to Michael Angelo, specially identified with what has been termed the anatomical style, no mention is found of anatomy or dissections, but instead we read that "the grandeur of his thoughts and cycles of ideas, the free creative power with which he calls into existence all conceivable motives of external life, make the praise of Ariosto intelligible"—"Michel, più che mortale, angel divino." It is evident that such criticism is destitute of a scientific basis; it has not the element of certainty; it is without the promise of progression; it stands aloof from external facts; its judgments are not so much inductions as intuitions. Criticisms of this sort belong in truth to the period prior to the time when Bacon, in laying the foundation of the inductive philosophy, made scientific progress a possibility for succeeding generations. Assuredly art criticism in these pages does not take rank among either the positive or the progressive sciences.

But, on the other hand, Dr. Burckhardt is the best exponent we have yet met with of the intuitional system. A work of art is for him an idea; the outward form is of worth only as the expression of an inward thought; colours are symbols of sentiments, even human figures are of value chiefly as they reveal an indwelling soul. There is scarcely an instance in these pages in which colour is found fault with because a wrong colour has been chosen or a right colour put into a wrong place; neither are characters much blamed when out of drawing or mistaken in line or composition; what is really demanded of a picture is that it shall be right-minded, true, and noble in intent. Thus it will be understood that this criticism is not so much that of a painter as of a poet or a philosopher. The book affords no evidence that the writer could take the brush out of the hand of an artist and correct the errors into which he had fallen; it rather shows that operation of mental

analysis which might fitly be applied to a written drama. In fact, the art of painting is here considered but as a language, and a picture as little else than a mode of writing ideas on wall or canvas. In like manner the office of criticism is assumed to depend on the response of mind to mind, of emotion to emotion; the critic and the painter have a soul in common, and when two souls happen to accord, all is as it should be. Thought, it seems to be supposed, comes from the picture and joins thought in the mind of the spectator, and when the thought of each is true and beautiful, then the critic is satisfied and gives his verdict accordingly. Such judgment, which is grounded on sympathy, implies in the first place fine intuitions, and in the second full culture, in neither of which requisites is Dr. Burckhardt wanting. The mind of the writer is not only informed but attuned; it responds to truth, it vibrates at the touch of beauty. Such conditions, which perhaps preclude infallibility just as they favour sincerity, involve the gist of a lecture recently delivered by Mr. Sidney Colvin at the Royal Institution. They reconcile the widest toleration with the narrowest intolerance; they imply love, and therefore necessitate hate. Such criticism, earnest and truth-seeking, is kind to everything save what it deems untruth and insincerity; a lie, a hollow pretence, it cannot away with. Thus, in these pages, "the Byzantine style," instead of apology, meets with denunciation; of this epoch it is said that "sanctity always takes the form of moroseness," that "even the Madonna becomes sulky," and that "in male heads there is often an expression of malice quite odious." These terms of reprobation make it sufficiently clear that Dr. Burckhardt has no leaning towards archaism; he inclines, as we have already said, too much to the absolute in philosophy and art to find satisfaction in the partial and the imperfect. Neither does he commit himself unreservedly, as Sir Joshua Reynolds did, to the later schools; the Caracci he can appreciate without blind idolatry, Correggio he can at once criticize and extol. Of this last artist we read, "To some temperaments he is absolutely revolting, and they have a right to hate him"; and yet in the next page we meet with one of those appreciative passages which ever and anon come as by a spontaneous outflow from minds of this sensitive, inward, and subjective cast. Having spoken of the chiaroscuro, or, as Sterne has it, "the correggiosity" of Correggio; having contrasted the grand creations of Michael Angelo in the Sistine with the sensuous compositions which fill the domes of Parma; having accorded to Correggio in these cupolas, which contain the heavens and all that dwell therein, the distinction of being the first to give "perfectly realistic representations of space and light," Dr. Burckhardt proceeds:—

But the most striking point of Correggio's style is the complete expression of motion in his figures, without which there is for him no life and no complete representation of space, which can properly only be measured by the eye. The real measure of his performance is in the human form in motion, with indeed an entire appearance of reality, and in some circumstances violently foreshortened. He first gives to the glories of the other world a cubically measurable space, which he fills with powerful floating forms. This motion is nothing merely external; it interpenetrates the figures from within outwards. Correggio divine, knows, and paints the finest movements of nervous life.

The contemporary criticism of the Continent presents strong contrasts; certainly there is little in common between the leading writers on art in France and in Germany. We need scarcely stop to glance at M. Théophile Gautier, M. About, and others, who with facile, florid, and flippant pen descend with equal knowledge and zest on the painting of a picture or the making of an omelette, on the overthrow of a dynasty or an intrigue in a harem. There are other French writers, among whom M. Boulé is conspicuous, who pass with ease from the Acropolis of Athens to the Hotel of the Minister of the Interior; or again there are others, like M. Émile Ollivier, who, having commenced a fatal war with a light heart, consoles himself in exile within the Chapel of the Medici by penning a "Dialogue sur Michel-Ange et Raphaël." Examples of the kind might be further multiplied; both M. Guizot and M. Thiers have amused themselves in the leisure which statecraft has left them by making excursions along the highways and byways of art. But these writers, unlike certain of their contemporaries in Germany, do not make criticism the serious business of life; they are hasty instead of deliberate, superficial rather than profound. A German digs deeply, if only to obscure the air with dust; a Frenchman glides over the surface smoothly; he gathers a harvest as from a fertile soil without turning a furrow. And further differences might be pointed out. Thus we have found Dr. Burckhardt ideal and subjective; his system rests on the inner consciousness; whereas his contemporary in Paris, Professor Taine, might almost, by reason of his more positive method, rank with the Comtists. The Frenchman looks upon the arts as phenomena which may be accounted for by physical causes. Genius itself is but an effect, or at most one link in a long chain of causation. Giotto and Raffaele are little else than the products of climate, race, and other outward circumstances. The conclusion seems to be that each method has its shortcomings; but, of the two, that of Dr. Burckhardt is in closer accord with the life and spirit of art. Yet in point of written style French critics have the advantage of clearness; their definitions and descriptions are sharp in outline; in fact, M. Boulé is clear almost to a fault, simply because, as a plausible advocate, he leaves out perplexities which might encumber his argument or prejudice his case. The Germans, of whom Dr. Burckhardt may be taken as the representative, are more judicial

* *The Cicerone; or, Art Guide to Painting in Italy, for the use of Travellers.* By Dr. Jacob Burckhardt. Edited by Dr. A. von Zahn. Translated from the German by Mrs. A. H. Clough. London: John Murray, 1873.

and impartial. It will be seen how much criticism owes to both countries; the defects of each are supplied by the other. Indeed it might be said of the literature of art, as sometimes it has been said of the kingdom of science, that if it were possible for Germans to make the investigations, and Frenchmen to pen and to formulate the results, the world would possess treatises little short of absolute perfection.

The Cicerone, though a model of criticism, is not a work of original discovery. It is moreover too curt to be exhaustive of what is already the common property of all well-read students. On many of the topics treated we could have borne more copious facts and longer disquisitions, especially from a writer who places old materials in new aspects. Thus it strikes us that that complex but vital question, the rise in Italy of "the Gothic style," under Giotto and others, is handled with little knowledge and insight. In contrast to this inefficiency we cannot help recalling eloquent and searching passages by Mr. Ruskin which, though sometimes too sweeping to be strictly accurate in detail, give vivid panoramic views of wide tracts in the history of art. The inroad of Gothic nations into Italy, which Mr. Ruskin compares to a glacier stream invading gardens of vine and olive, is just the subject which might have fitly fallen under the cognizance of a German critic. The truth is, we have to thank Dr. Bueckhardt for so much that we are tempted to ask for more.

GERMAN LITERATURE.

IT is sufficiently remarkable that, notwithstanding all that has been written upon the Society of Jesus*, there should hitherto have been no compendious digest of the history of the Order, combining the notice of external incidents with an inquiry into its general spirit and its influence on the course of human affairs. Such, according to Professor Huber, is the case. It seems equally remarkable that the task should have fallen to the lot of one of the most decided opponents of the Jesuits in our own day, and that it should nevertheless have been performed with temper, dignity, and a very fair approximation to impartiality. An absolutely impartial history of Jesuitism will obviously never be written until the Order has long become a thing of the past. The interest in its fortunes which is necessary as a stimulus to the task implies in our day a strong party feeling on one side or the other. Professor Huber cannot write otherwise than as a steady antagonist of Jesuitism; but his antipathy is moderated by the conviction, expressed in his preface, that the Society is after all rather the hand than the brain of the Church of Rome. He apparently feels that the secular authorities will consider that they have done enough in banishing the Jesuits—a measure of questionable policy and legality in his eyes. Nothing, he insists, can be effected without a thorough internal reform of the Roman Church; the alternative of the sixteenth century, reaction or reformation, must be again presented to her, and the influence of the secular power must be energetically exerted in favour of the reforming party within her own bosom. The evident difficulty is that the number of really devout members of the Church who think with Professor Huber is small, and that the majority of merely nominal members will generally wish to go much further than is agreeable either to him or to the Governments. The work is divided into nine sections, treating respectively of the foundation of the Order, its constitution, its ecclesiastical and political activity, its missionary operations, its position as an *imperium in imperio* within the Church, its religious doctrines and practice, its educational system and works of literature and art, the Jansenist controversy, and the suppression of the Order by Clement XIV. A marked endeavour at impartiality is everywhere discernible; the writer renders abundant justice to eminent Jesuits such as Mariana, censures the most flagitious points of Jesuit teaching and practice with studied moderation, and seems always anxious to keep in view his main thesis, that the corruption of religion is mainly attributable to the evil tradition of the Court of Rome. A German Pope at Munich would probably be his remedy, if he felt at liberty to state his convictions without reserve. The literary execution of the book is able, but it belongs essentially to the pamphlet class, and will be forgotten after it has performed its office of enlightening readers anxious to acquaint themselves with particulars material to a controversy of pressing interest. For this it is excellently adapted by the judicious arrangement of the matter, and the fluency and clearness of the style.

The correspondence between the Austrian Emperors Joseph and Leopold and Prince Kaunitz, the most important part of which is now published under the editorship of Herr Adolf Beer†, is full of interest for the general political history of Europe. It bears little reference to the attempts at internal reform which constitute the most characteristic feature of Joseph's reign, but illustrates the system of foreign politics common in the main both to the Emperor and to his Minister. The influence of the latter in this department was, in Herr Beer's opinion, much greater than is commonly supposed, and undoubtedly this correspondence exhibits Joseph as usually in substantial agreement with him. The leading principle of Kaunitz's policy appears to have been the humiliation

of Prussia, to which end he was prepared to purchase the support of Russia by countenancing her designs upon Turkey, reserving the right to obtain what he could at the latter country's expense. Turkey, in fact, was to be partitioned like Poland, minus the participation of Prussia in the proceeds of the spoliation. This cannot be described as a sagacious or high-minded policy, and it terminated in the sole advantage of Russia. Kaunitz's memorials are drawn up with great terseness and felicity of expression, but nothing can disguise the short-sighted egotism of his political system. Joseph's letters are in general highly interesting, especially those written on his numerous journeys. The portion of the correspondence relating to Bavaria is reserved for publication in a separate work.

Prince Kaunitz reappears in another diplomatic collection containing a vast magazine of historical information, Alfred von Vivenot's‡ edition of the State Papers relating to the policy of Austria during the wars of the French Republic, down to the treaty of Lunéville in 1801. The first volume, extending from January 1790 to April 1792, comprises four hundred and two documents, not all proceeding from or addressed to the Austrian Chancery, but all bearing in some way upon Austrian affairs, and all written by sovereigns, Ministers, or diplomatic agents. In the editor's opinion, this collection is calculated to exalt the world's estimate of the Austria of the latter end of the eighteenth century, as the staunch representative of the principle of order. Without disparaging the principle, its champions at the respective European Courts make but a poor figure, pulling all ways, full of mutual envy and distrust, and totally unable to apprehend the new doctrines which were revolutionizing Europe. There is little room for censure under the circumstances, but still less for admiration. Whatever, however, may be thought of Herr von Vivenot's conclusions, there can be no question of the great value of the materials from which he has derived them; it would be impossible in our space to mention half the interesting episodes of history which the correspondence tends to illustrate.

"Sketches of St. Petersburg Society"†, partly a reprint from the *Neue Freie Presse*, are exclusively political in character. They possess the advantages and defects of anonymous political authorship, where the writer is not hampered by the restraints of caution and etiquette, but where at the same time there is no guarantee for the authenticity of his statements, apart from the intrinsic probability they may possess. On the whole, we should be inclined to pronounce favourably respecting the author's credibility, especially as his pages are principally dedicated to the description of a state of things which, upon his own showing, has to a great degree passed away. Under the form of a series of biographical sketches, he delineates the rise, progress, and abatement of the specifically national movement which, provoked into activity by the Polish insurrection of 1863, for a time carried everything before it, and threatened to place Russia in a position of antagonism to Western civilization similar to that occupied by the Church of Rome towards modern thought. For the first time in the history of Russia her destinies appeared to be directed by an able journalist—Katkoff, the editor of the *Moscow Gazette*, whose character, as well as that of the chief official representatives of the party, the brothers Miliutin, is here sketched from an inimical point of view, yet apparently without animosity. The almost complete collapse of a movement so spontaneously originated, and so much in harmony with the instincts and traditions of the people, is a curious phenomenon, only explicable on the supposition that it had not in fact penetrated much beyond the reading classes, and that these were sufficiently intelligent to recognize in the long run the absolute necessity of European capital for the development of the country. It is also apparent that the traditions of Russian statecraft will only be modified very slowly. They are at present personified in Prince Gortchakoff, whose influence and physical powers are here represented as alike on the wane, and the reversion of whose office is disputed by several leading statesmen. The author's favourite is M. Walujeff, whom he considers as the representative of the liberal and enlightened element in Russian policy. General Ignatieff, the Minister at Constantinople, is described as a man more favoured by luck than ability, but so very lucky that it would be difficult to set bounds to his possible advancement. There are also retrospective accounts of former statesmen whose influence is perceptible as an element in the present condition of affairs, especially of General Protassoff, whose dragon-like away over the Russian Church during the reign of Nicholas is said to have contributed much to the intolerant and thoroughly secular spirit which pervades it at present. On the whole, the picture of high political society at St. Petersburg is not a pleasing one, and serves as an apt commentary on the motto of the book—"La facilité de faire sa carrière préserve la Russie du mécontentement."

Roger, Count of Bruges‡, does not impress us as a traveller of remarkable discernment; his eye, at least, dwells mainly on externals, and we learn scarcely anything respecting the inner life of the remarkable countries he has visited. It is disappointing,

for instance, to accompany him to Mexico so soon after the triumph of the national idea personified in President Juarez merely to learn that the indomitable advocate looked like a villain, that he wore a black coat, and leaned upon a golden-headed cane. Such matters, however, as an ordinary observer may be expected to notice—the complexion of the Havana scorchitas, or the economy of American hotels and railways—are described agreeably enough, and occasionally we encounter a remark of some significance, as that, for instance, while the German nation at home instinctively sympathizes with the Northern American, the German emigrants in the South are more Confederate than the Confederates themselves. This, however, can scarcely apply to the settlers in Texas.

The lectures of Dr. E. Zeller*, one of the most eminent of contemporary German theologians, probably embody with sufficient accuracy the views of candid and enlightened public opinion in Germany with reference to the conflict of jurisdiction between the State and the Church. As a divine, Dr. Zeller is naturally unwilling to regard the Church as a mere department of the civil administration; but he is evidently impressed with the great difficulty of treating it otherwise, so long as the adjustment of its relations with the State involves the possibility of collision on a variety of questions, on all of which, if compromise be impossible, the Church must submit to be overruled. In the event of her not so submitting, the author's reasoning seems to leave room for no other solution than disestablishment and disendowment, a measure extremely repugnant to Continental statesmen. The free activity of a free Church seems natural enough in this land of individual liberty, but is regarded as something portentous in countries where all the relations of life are matters of governmental interference and prescription. Dr. Zeller, however, is sanguine in the belief that the Established Protestant Churches will prove manageable, and isolated bodies of seceders like the German Catholics are of little account. The Church of Rome is the great difficulty. With the most earnest wish to respect all vested interests, Dr. Zeller can but admit that, if a Church will concede nothing to the State, the latter must refuse her official recognition—that is, disestablish her. The Church of Rome, in her present frame of mind, will assuredly make no concessions; the case for the application of the remedy will accordingly arise; and Dr. Zeller labours with indifferent success to convince himself and his readers that it will not aggravate the disease. Had the Prussian Government fostered the Liberal tendencies of a portion of the Catholic clergy, the present situation would probably not have existed; it remains to be seen whether the recent remedial measures are too late. The volume is introduced by an able inquiry into the separation between the spheres of Church and State gradually occasioned by the increasing divergences of religious opinion, and is concluded by the consideration of the best way of reconciling the conflicting views of the two institutions on such practical questions as education and marriage. Everywhere the same principal aim is apparent—the preservation of the greatest liberty of action for the Church compatible with the maintenance of that system of superintendence and tutelage the absence of which a Prussian statesman is hardly able to conceive.

Pending the more copious biography of Ludwig Feuerbach †, understood to be in preparation, Dr. C. Beyer's reminiscences, though characterized by too partial an enthusiasm, are still very acceptable. The philosopher manifestly had his full share of the intellectual unsoundness and crotchetedness of his family, combined with their masculine independence, and a logical consistency peculiarly his own. A man of this uncompromising turn was not likely to make much way in a country governed by officials. Despairing of obtaining any public situation, he married without one, and led almost the life of a hermit, first at the castle of Bruckberg, and subsequently, after a serious reverse of fortune, at Rechenberg, undergoing annoyances and privations which seem almost incredible in the case of a writer whose readers were counted by thousands all over Germany and North America. Without being a misanthrope, Feuerbach seems nevertheless to have shunned all society except that of his humble country neighbours, and to have carried the simplicity of his tastes and habits to a somewhat exaggerated degree. Many anecdotes are related of his disinterestedness and love of justice. In personal intercourse he commonly appeared awkward and embarrassed, but occasionally kindled into remarkable animation and eloquence. As a thinker he has left his mark on the age, less by absolute originality than by the clearness with which he discerned, and the ruthless energy with which he expressed, the logical results overlooked or avoided by less perspicacious or more timorous men, and the practical direction he imparted to speculative problems. The fine portrait prefixed to this volume bespeaks the *enfant terrible* of philosophy; the physiognomy is almost that of an artist.

It seems almost incredible that even a German biographer should have managed to spin eight hundred large octavo pages out of the first half only of the uneventful life of Johann Sebastian Bach. ‡ The feat would have been impossible without a liberal resort to musical criticism, which constitutes indeed the staple of the volume. There are also copious particulars respecting Bach's ancestors, whose history is industriously traced out. We cannot

discover, however, that Herr Spitta even claims to have added any noteworthy particulars to Bach's history; and if his work is destined, as he anticipates, to supersede all former biographies, this can only be the case with the strictly musical public. For this class of readers it may be well adapted, supposing them to be possessed of, and competently acquainted with, the compositions which form the theme of Herr Spitta's exhaustive and enthusiastic exposition.

The third volume of Julian Schmidt's essays on the intellectual aspects of the present day* is hardly written with the finish of the others, and seems to bear some traces of haste or fatigue. Something of this may be attributed to the inferior interest of the themes discussed, the German novelists whose works form the subject of the more elaborate notices affording much less scope for remark than the Turgeneffs and George Eliots of former volumes. Fritz Reuter, whose realism accords so perfectly with Dr. Schmidt's own critical principles, obtains the most cordial praise; Spielhagen is treated as a writer of great significance, but is cautioned not to misrepresent the national character to foreigners. Wilibald Alexis, no great favourite with the critic in general, is commended as a descriptive writer, and as especially identified with the history and scenery of Brandenburg. One of the most interesting essays is that on Hermann Grimm, the association of whose æsthetic criticism with lofty moral ideas is exhibited in a very interesting light.

"All Sorts of Things" is the highly appropriate title of a curious medley by W. Spindler †, which possesses at least the incontestable merit of being readable throughout. In his more serious essays the author appears as a discontented politician, out of humour with everything in Church and State, and generally on grounds honourable to his sincerity and elevation of sentiment. The substance of many of his criticisms on the prevailing disposition of the people to condone political delinquencies in consideration of military success is excellent, but the style is frequently more provocative of mirth than of earnest conviction. Some of the little poems interspersed are very pretty; a successful translation of Poe's "Raven" demands especial notice.

The excellent series of popular scientific lectures, and that of discussions on controverted topics of the day, published by C. Lüderitz ‡, continue with unabated interest. Among the former we may particularly refer to one by Dr. H. Blüner upon artistic connoisseurship in the antique world, in which the æsthetic faculty of the Romans is rated very low, and to Dr. Peters's essay on the approaching transit of Venus. The latter series includes a concise but comprehensive review of the leading political incidents of the German Empire in the past year, from the pen of Dr. W. Oncken. The prospects of the Old Catholic movement are very favourably discussed by the eminent Lutheran theologian, Professor Nippold; and Professor Huber contributes a compendium of his larger work on the Society of Jesus.

The last number of the *Russian Review* § contains a number of interesting statistics respecting Russian shipping, railways, and banking; and an article on the progress of higher education, which the Government appears earnestly endeavouring to promote. Greek has been recently introduced into numerous schools where it was formerly omitted, and the time devoted to both classical and mathematical studies has been extended in all institutions under Governmental control.

ADVERTISEMENTS.

BIRMINGHAM TRIENNIAL MUSICAL FESTIVAL, in
AID OF THE FUNDS OF THE BIRMINGHAM GENERAL HOSPITAL.

THIRTY-FIRST CELEBRATION.

On Tuesday, August 20; Wednesday, August 21; Thursday, August 22; Friday, August 23.

President—The Right Hon. the Earl of SHREWSBURY and TALBOT.

Principal Vocalists—Madlle. Titicus, Madame Lommes-R'errington, and Madlle. Albani;
Madame Paly and Madame Trebell-Hewitt. Mr. Sims Rees, Mr. Vernon Higby, and Mr.
W. H. Cummings. Mr. Hantley and Signor Foli.
(Organist—Mr. Stiles.
Conductor—Sir Michael Costa.

OUTLINE OF THE PERFORMANCE.

THURSDAY MORNING, August 22.—Elijah. THURSDAY EVENING.—A New Cantata, by F.
Schire, entitled "The Lord of Hough" (first time of performance); and a Miscellaneous
Selection, to include the Song of Titicus, &c.

WEDNESDAY MORNING, August 21.—A New Overture, "The Light of the World," composed
expressly for this Festival, by Arthur S. Sullivan. WEDNESDAY EVENING.—A Miscellaneous
Selection, comprising Beethoven's Symphony in C Minor; and the National Hymn, &c. (first
time of performance).

THURSDAY MORNING, August 22.—Messiah. THURSDAY EVENING.—A New Cantata, by
A. Handcock, entitled "Elijah" (first time of performance); and a Miscellaneous Selection,
comprising "Prelude to William Tell," &c.

FRIDAY MORNING, August 23.—Sacred Cantata, "God Thou art Great, Spohr; Imperial
Mass, Haydn; Ave Maria (first time of performance), Rossini; Double Chorus, Cantata (first
time of performance), Rossini; Selections from Israel in Egypt. FRIDAY EVENING.—Judas
Maccabaeus.

The following Compositions of Handel will be performed, by permission of Albert Grant,
Esq., The Song of Titicus, National Hymn, Ave Maria, and Cantata.

Programme of the Performances will be forwarded by post on application to the under-
signed, at the Office of the Festival Committee, 8 Abchurch Lane, Birmingham.

By Order,

HOWARD B. SMITH, Secretary to the Festival Committee.

CRYSTAL PALACE.—PARTICULAR ATTRACTIONS

THIS DAY AND NEXT WEEK.

Saturday (August 10).—Opera, at 5. Great Chinese Fete and Feast of Lanterns in Evening.
Monday.—Theatricals; 8. Roman, at 8.
Tuesday.—Theatricals; 8. Roman, at 8.
Wednesday.—Orchestral Music; 8. Roman, at 8.
Thursday.—Opera (production of "Norma"); 8. Roman, at 8. Great Fireworks, 8.30.
Friday.—Orchestral Music; 8. Roman, at 8.
Saturday.—Special performance of Opera.

The Fine Arts Courts and Collections, including the Picture Gallery (the Works on sale), the
Natural History and Mineralogical, all the various illustrations of Art, Science,
and Nature, and the Gardens and Park always open. Music and Fountains daily.

Admission, Monday to Friday, 1s.; Saturdays, 2s. 6d.; 1s. for Guinea Season Ticket.
Cryстал Palace.—FORESTERS' GREAT GATHER-
ING ON TUESDAY NEXT.

DORR'S GREAT PICTURE OF "CHRIST LEAVING the
PRÆTORIUM" with "Night of the Crucifixion," "Christian Martyrs," "Francisco
de Rimini," "Nemphylis," "Andromeda," &c., at the DORR GALLERY, 35 New Bond
Street. Ten to Six.—Admission, 1s.

ELIJAH WALTON.—EXHIBITION including "A Storm
at Sea" and "Good Storm in the Desert," and many new and important Drawings,
Alpine and Eastern. NOW OPEN at Burlington Gallery, 101 Piccadilly. Ten to Six.—
Admission, with Catalogue, 1s.

BRITISH MUSEUM.—THE BRITISH MUSEUM is OPEN
to the Public from ten o'clock on Mondays, Wednesdays, and Fridays, and from
Twelve o'clock on Saturdays, throughout the year. On application to the Principal
Librarian, complete facilities are afforded for the study of specified branches of the Collections,
on Tuesdays and Thursdays, to Classes or Parties of not more than Fifty in number for the
Lower Galleries, and Thirty for the Upper Galleries.

British Museum, & WINTER JONES, Principal Librarian.
August 9, 1873.

ST. BARTHOLOMEW'S HOSPITAL and COLLEGE.

The WINTER SESSION will begin on Wednesday, October 1.
The Clinical practice of the Hospital comprises a service of 710 Beds, inclusive of 24 Beds
for Convalescent Patients.

Students can reside within the Hospital walls, subject to the College regulations.
For all particulars concerning either the Hospital or College, application may be made,
personally or by letter, to the Manager, WALTER of the College.

A Handbook will be forwarded on application.

COOPER'S HILL COLLEGE.—The following are the Names
of some of the SUCCESSFUL COMPETITORS at the recent Examination for
admission to the Indian Civil Engineering College:

Simon, John Harrington	234	Stewart, Robert	1544
Osborne, Henry James	189	Lodge, Charles Henry	1600
White, John Charles	190	John, Edward Henry	1900
Osborne, Henry James	189	John, Edward Henry	1900

South of Mr. J. ASHLEY, of the Hospital, Road, & Hamstead, who receive RESIDENT
and NON-RESIDENT CANDIDATES. R.M.—Ten years sent up, eight passed.

GUYS HOSPITAL.—The MEDICAL SESSION commences

on October 1. The INTRODUCTORY ADDRESS will be given by JAMES HINTON,
Esq., on Wednesday, October 1, at Two o'clock.

MEDICAL OFFICERS.

Consulting Physicians.—Mr. W. Gull, Bart. M.D., D.C.L., F.R.S.; G. Owen Rees, M.D., F.R.S.;
Physicians.—R. G. Habershon, M.D.; S. Wilks, M.D., F.R.S.; F. C. M. Fyfe, M.D., F.R.S.;
W. Rogers, M.D.
Assistant Physicians.—C. Hilton Fagge, M.D.; F. H. Pye-Smith, M.D.; Fred. Taylor, M.D.
Consulting Surgeons.—John Hilton, Esq., F.R.S.; Edward Croft, Esq.,
Surgeons.—J. Birkett, Esq.; J. Cooper Foster, Esq.; Thomas Bryant, Esq.; Arthur E.
Durham, Esq.
Assistant Surgeons.—H. G. Howe, M.S.; N. Davies-Colley, M.C.
Consulting Obstetric Physician.—Henry (Edman), M.D.
Obstetric Physicians.—J. Braxton Hicks, M.D., F.R.S.
Assistant Obstetric Physician.—J. J. Phillips, M.D.
Ophthalmic Surgeon.—C. Bader, Esq.
Assistant Ophthalmic Surgeon.—C. Haggens, Esq.
Surgeon-Dentist.—J. S. A. Salter, M.D., F.R.S.
Dentist-Surgeon-Dentist.—H. Moon, Esq.
Aural Surgeon.—James Hinton, Esq.
Medical Reporter.—Frederick Taylor, M.D.
Surgeon of Dispensary.—J. F. Goodhart, M.D.
Apothecary.—James Stucker, Esq.

The Hospital now contains 715 Beds. Of these 221 are for Medical Cases; 350 for Surgical;
25 for Gynaecological; 15 for Syphilitic, and 50 for Ophthalmic Cases. There are also 30
Children's Beds, and 40 Reserve Beds, which will be in use in the winter season.
In connection with the Lying-in-Charity, about 2,000 Cases are annually attended by the
Students.

Number of Patients relieved during the year, about 81,000.

WINTER SESSION LECTURES.

Medicine.—Dr. Wilks and Dr. Habershon.
Clinical Medicine.—Dr. Habershon, Dr. Wilks, Dr. Pavy, and Dr. Moxon.
Surgery (including Demonstrations in Practical Surgery).—Mr. Birkett and
Mr. Cooper Foster; assisted by Mr. Rendle.
Clinical Surgery.—Mr. Birkett, Mr. Foster, Mr. Bryant, and Mr. Durham.
Anatomy (Descriptive and Surgical).—Mr. Durham and Mr. H. Jones.
Physiology and General Anatomy.—Dr. Pavy and Dr. Pye-Smith.
Clinical Lectures on Midwifery and Diseases of Women.—Dr. Braxton Hicks.
Chemistry.—Dr. Deane and Dr. Stevenson.
Experimental Philosophy.—Mr. G. F. Rodwell.

DEMONSTRATIONS.

Anatomy.—Mr. Davies-Colley, Mr. Rendle, and Mr. Clement Lucas, Demonstrators.
Practical Physiology.—Dr. F. H. Pye-Smith.
Medical Jurisprudence.—Dr. C. Hilton Fagge.
Cutaneous Diseases.—Dr. C. Hilton Fagge.

Clinical Lectures in Medicine, Surgery, and Midwifery, Weekly.
Special Classes are held in the Hospital for Students preparing for the Examinations of the
University of London, and of the College of Surgeons.
The Museum of Anatomy, Pathology, and Comparative Anatomy (Curator, Dr. Fagge)
contains 10,000 Specimens, 4,000 Drawings and Diagrams, a unique collection of Anatomical
Models, and a Series of 400 Models of Skin Diseases.

Students must give satisfactory testimony as to their
Education and Conduct. Fees: £40 for the first year; £40 for the second; £20 for the third;
and £10 for succeeding years of attendance. One hundred Guineas in one payment entitles a
Student to a Perpetual Ticket.

The House-Surgeons and House-Physicians, the Obstetric Residents, the Clinical Assistants,
Dressers, Dispensers in the Eye Wards, and Clinical Clerks, are selected from the Students
according to merit.

Six Scholarships, varying in value from £25 to £40 each, are awarded at the close of each
Summer Session for general proficiency.

Two Gold Medals are given by the Treasurer—one in Clinical Medicine, and one in Clinical
Surgery.

A Voluntary Examination takes place at Entrance, in Elementary Classics and Mathematics.
The First Three Candidates receive respectively bursaries of £25, £20, and £10.

Several of the Lecturers have Vacancies for Resident Private Pupils.
For further information apply to Mr. STUCKER.

Guy's Hospital, July 1873.

LONDON INTERNATIONAL COLLEGE, Spring Grove,
near Tottenham.—The AUTUMN TERM COMMENCES on September 16. Further
information may be obtained by applying to Dr. LEONARD SCHEIDT, the Principal, at the
College.

TRINITY COLLEGE, GLENALMOND, Perth.

Warden—Rev. R. THORNTON, D.D.

A School on the model of the greater Public Schools in England. There is a resident Medical
Officer. For particulars apply to the WARDEN.

The School will meet on Tuesday, September 9.

TRINITY COLLEGE, EASTBOURNE.

Master—Rev. JAS. R. WOOD, M.A., Trinity College, Cambridge.

The next TERM commences on Saturday, September 20, when TWO SCHOLARSHIPS
are offered for Competition.

BRIGHTON COLLEGE.

President—The Earl of CHICHESTER, Principal—The Rev. C. BIGG, M.A. into
Senior Student and Tutor of Christ Church, Oxford.—There are special Modern Forms,
affording every necessary preparation for the India or Army Examinations. The School is
well-endowed and is perhaps the healthiest public school in the Kingdom.—Apply to the
Bursar.

GARRICK CHAMBERS.—The next Term will commence
on September 16. The Honour List for the years 1869-1870 contains the Names of
127 SUCCESSFUL PUPILS, appointed to the following Departments:

57 to the Civil Service of India.
10 to Attachments in the Diplomatic Service.
12 to the Foreign Office.
24 to other Superior Offices of the Home Civil Service.
11 to the Ceylon Civil Service and to Chinese Interpretships.
3 to the India Engineering College.

Of this number 33 gained the First place in their respective Competitions.

The List may be had on application, by letter, to the LIBRARIAN, Garrick Chambers,
Garrick Street, London.

PREPARATORY SCHOOL for BOYS, Saugeen,
BOURNEMOUTH.

A First-Class PREPARATORY SCHOOL for BOYS will be Opened on September 25
next, by the Rev. E. B. BRACKENBURY, of Exeter College, Oxford (late Minor Canon of
Bristol Cathedral), who has been engaged for several years past in Tuition, and has undertaken
the charge of the School carried on to the present time by M. J. BARRELL, Esq., The Codrers,
Bournemouth.

The house stands on the East Cliff, facing the Sea, but sheltered on every side by the pine
woods.

Bournemouth is now specially recommended by Medical Men for Children of delicate
constitution, and the house has been most carefully built, and arrangements, made by means
of hot-water apparatus, so that delicate Boys may have every comfort and convenience.

There are first-rate French, German, Music and Drawing Masters, and in the case of Boys
possessing a good ear and voice, the Rev. E. B. BRACKENBURY will be very glad to take
special pains in teaching them to sing from notes, to qualify them (if necessary) for the various
Choral Scholarships that are to be obtained at different Schools.

There are Three Vacancies in the year, viz.: five weeks at Christmas, three at Easter, and
seven at Midsummer.

Terms, 10 Guineas. Day Boys, 36 Guineas. But special arrangements would be made with
Parents bringing their Children to Bournemouth for a short period.

For references to Parents of former Pupils, and for further particulars, apply 221 September 5
to the Rev. E. B. BRACKENBURY, 2 Cambridge Park, Redlands, Bristol; and after that date,
Saugeen, Bournemouth.

OXFORD DIOCESAN SCHOOL, Cowley, near Oxford.

Visitor—The Lord Bishop of OXFORD.

A Public School, limited to One Hundred Boys, who are prepared for the Universities.
Military or Civil Service Examinations, for the Professions and Commerce.
The Terms are £25 a year, which includes Board, Education, Laundry, &c.
A Prospectus and particulars may be had of the Principal, The Principal,
The Next School Term begins on September 4.

EDUCATION, SUPERIOR—THE WICK, Brighton.

The following Distinctions have been recently obtained by PUPILS of this School, viz.:
Balliol Scholarship, Woolwich Cadetship, and in the last Examination, and also in the last
Classical Moderns, &c. &c. House stands in its own grounds of eight acres. Excellent
School. A large Department for Pupils preparing for Public Schools.—For terms, apply to
the PRINCIPAL, The Wick, Brighton.

THE SATURDAY REVIEW

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 930, Vol. 36.

August 23, 1873.

Transmission abroad.]

Price 6d.

ELECTIONEERING PROSPECTS.

THE present intention of the Government is understood to be to defer the dissolution until after another Session, and one reason assigned for this resolution is that the Liberal party cannot easily be in a worse position than it is now, while it may be in a better a year or so hence. It is useless to speculate on the possibilities of a very uncertain future. Things may go against the Ministry or for them. Fresh blunders may or may not be committed; but in any case the difference between the results of an election held now and the results of an election held next year cannot be very great. It is easy to form a fairly correct estimate of what will happen whenever the dissolution may take place. There is no doubt that there will be a great Conservative gain, and there is not much doubt that this gain will be large enough to make a change of Government indispensable. But it is difficult to see how a Conservative Ministry can have any but a small majority. The Liberal party is so strong in the present Parliament that even to equal them their opponents will have to win a series of victories. The position of the two parties now is in some degree like that which existed in the last days of the Melbourne Ministry. Then, as now, a Liberal Government had resigned, and had to return to office because the Conservatives would not form a Ministry. Then, as now, the resuscitated Ministry had gradually sunk in repute, and the country was weary of the Government. Whether or not there is a Conservative reaction in the country now, there certainly was one then. The dissolution at last took place, the new elections were held, and Sir ROBERT PEELE took office with a commanding majority. But there were two circumstances then telling immensely in favour of the Conservatives to which there is no parallel now. The country then wished to get the Conservative leader in office, not only because he was the Conservative leader, but because he was Sir ROBERT PEELE, and was the one man in England who, it was thought, could give the nation what it then happened to want. The whole financial system was in confusion. The Whig Budgets had been a succession of blunders, and it was thought that a great financier was needed to get things out of the mess, and that the only great financier to be had was Sir ROBERT PEELE. No corresponding influence is felt now. There is nothing which the Conservative leaders can personally offer to the nation. They are not likely to be able to discharge their official duties better on the whole than the present tenants of office. In the second place, the Conservatives then started on an equality. Sir ROBERT PEELE had beaten the Government on a vote of want of confidence, and thus every seat gained at the election gave two votes towards a Conservative majority. When the next election takes place, the very lowest at which the majority commanded by the present Government can be put is sixty. This is probably putting the number too low, but even if this number is taken, the first thirty seats gained by the Conservatives will only suffice to put the two parties on an equality, whereas the same amount of success would, when Sir ROBERT PEELE took office, have given him a majority of sixty. But thirty seats is a large amount for the Conservatives to gain. It is enough to exhaust most of the seats which the Conservatives are tolerably sure to snatch from their opponents. Up to thirty it is not difficult to reckon English county and borough constituencies which will probably displace Liberals for Conservatives. But after that number is reached it becomes much more difficult to say where the Conservatives have a probability of success. The changes in Scotland, in Ireland, and in

Wales will, it may be guessed, not be very great, and, perhaps, not much in favour of the Conservatives when they are made. There will also be here and there, by chance or local influence, a Liberal gain in English constituencies. If, therefore, the Conservatives gained a balance of ten seats beyond the thirty seats which they must gain in order to start with a majority at all, they would do extremely well; but they would take office with a majority of no more than twenty, and this is as small a majority as a Government can have that wishes to take and hold office with credit.

But there are circumstances in which a very small majority is sufficient for a Ministry, and there is every reason to suppose that the Conservatives will find even a majority of twenty enough to ensure their possession of office during a length of time that may not be inconsiderable. Their adversaries will have no reason to wish that they should be defeated very quickly, for they in their turn would not wish for office until they were sure of a satisfactory majority. The Liberal leaders, too, are wearied, fatigued, and dispirited. They want repose. They need time to efface the memory of their blunders. They want fresh cries, new hopes and motives; above all, they want leisure for the seeds of peace and good will to spring up among themselves. Their supporters, too, will wish to give a new Government fair play, and would discountenance any measures that might be set on foot for a premature return to power. Even Liberal constituencies would also wish to see what the Conservatives would do were they in office. It is now nearly thirty years since the Conservatives held office with the means of proposing any measures of their own, and the wish to see what they would propose, if left to themselves, will be very natural and very general. If they can do any good in regard to finance, or the army, or Ireland, or India, or legal reform, it will be felt that they ought to be allowed time and opportunity to do it. They will not be obliged, as in their last term of office, to do the work of their rivals, and devote themselves to thinking how to outstep the Liberals in devising a Reform Bill. They will be able to take up such subjects as they please, and to make proposals really their own. They will be able to read up as many secret documents as they please, and thus to invent a policy where they now have none. It will be interesting to see what they will do under such circumstances, and the nation will not like to forego this source of interest. Then they will have appointments to make, and the public will welcome the introduction of some variety in the world of promotion. There is, in Mr. GLADSTONE'S appointments, a monotony which is perhaps justifiable, but which is certainly rather wearisome and depressing, and it would freshen official life if the wind blew for a while from another quarter. Once therefore in power, the Conservatives may hope to retain office for some time, and it may easily happen that they may find an element of great strength in the composition of the forces opposed to them. The Irish may do them great service. It is probable that the next Parliament may number a large increase of the supporters of Home Rule and of Ultramontanism. They will form a separate clique or faction, and will be very dangerous allies, although not at all dangerous enemies. The Conservatives need have nothing to say to them. They will make demands of some sort, and the Conservatives will, it may be expected, simply reject their demands. But the Liberal leaders will either have to do something to conciliate them which would be ruinous to the prospects of the party in almost every English and Scotch constituency, or they will have to do without them; and then, if the votes of these Irish representatives are to be subtracted from the

nominal strength of the Liberal minority, the real Conservative majority would be very large.

The prospect of a new Parliament also suggests speculations as to what will be the new elements introduced into it, and the feelings and opinions with which those who are to form the majority will take their seats on the SPEAKER'S right hand. Some indications on these heads may be gathered from the names, the position, and the addresses of candidates who have already come forward. We know beforehand two or three characteristics of the next House of Commons. It will, in the first place, show a large augmentation of local men. The wealthy resident is evidently the favourite of the newly enfranchised voter. If the elector is so pre-eminently happy as to find a brewer willing to represent him, then he has all his heart can want. If he cannot get a brewer, he may hope to get a distiller, or, if not, at least some one with large works, a big house, a smiling and familiar face, and inoffensive opinions. These are the men who, in conjunction with the relations of the great Conservative proprietors, will carry seats now held by Liberals and give Mr. DISRAELI a majority. So much is evident from what is already known of the contests that are to take place. And we may be equally sure from the evidence of Conservative manifestoes that the Conservatism of the new Conservative majority will be of a very mild type. A Liberal must be a very hot-headed Liberal indeed if he regards the programme of the ordinary Conservative as reactionary. Most Conservatives are like moderate Liberals who wish their own side to be in office. They say so precisely what the Liberals have taught them to say, that the difference in Conservative and Liberal addresses is imperceptible to the naked eye of the ordinary voter. There is, for example, a contest now going on in Radfrewshire for the seat vacated by Mr. BURKE. Two Colonels, one a Liberal and one a Conservative, are the candidates, and the chairman of a public meeting which was recently held in the county said that he thought the constituency might get on very well with either of the two Colonels. He might well say so. It appears that these political rivals are absolutely agreed on every point of the slightest interest to Scotch voters. The Conservative Colonel as well as the Liberal thinks that the Game Laws should be largely modified, the laws of entail and hypothec abolished, and the county assimilated to the borough franchise. The only points on which they differ are as to the value of international arbitration and the expediency of allowing Dissenters to be buried after their own fashion in English churchyards. Conservatism is certainly boiled down to the last point of mildness when these are the marks of its distinction from Liberalism. We shall soon have our normal candidate, the local Conservative brewer, reposing in the majestic silence of beer, until his Liberal rival has put out an address, and then announcing that he endorses every political opinion of his opponent, but that, unfortunately, they do not agree about the true site of ancient Troy; he must go to the poll, and he hopes all his kind fellow-townsmen will rally round the Barrel, the Altar, and the Throne. He may say this with a proud confidence as to the result. They will rally as they are asked, and he will go to Westminster as their representative; but when he gets there he will not be a very desperate sort of enemy for Liberals to deal with.

THE CANADIAN SCANDAL.

IT is unfortunately too probable that the name of the GOVERNOR-GENERAL will be mixed up in the controversy which now occupies universal attention in Canada. His personal honour will not be questioned by his most violent opponents; but he will be accused of sheltering his Ministers from Parliamentary investigation. In the colonies where responsible government prevails, the duty of the representative of the Crown is in the majority of cases rather to apply fixed rules to each particular case than to exercise political discretion. The Governor-General of Canada chooses or retains Ministers who possess the confidence of a majority of the House of Commons; and on fit occasions he gives them the opportunity of appealing to the constituencies. His own preferences and his opinions on public questions are, according to constitutional doctrine, suppressed or held in reserve. It is his duty as umpire to see that the rules of the Parliamentary game are strictly observed, instead of becoming a player. In extraordinary circumstances only the head of the Government interferes with a weight which is proportioned to his

habitual impartiality. The assailants of the Canadian Ministry maintain that the contingency had arisen when the Parliament reassembled after an adjournment of two months on the 13th of August. It had previously been arranged that the continuation of the Session should be only formal, and that it should be followed by an immediate prorogation. The commencement of the recess had been deferred to enable the Committee on the Pacific Railway to prosecute the inquiry into the alleged acts of Ministerial corruption, and to present its Report. In the meantime the Act which enabled the Select Committee to take evidence on oath had been disallowed by the Imperial Government; and consequently the Committee was unable to prosecute its labours. The Canadian Government offered to issue to the same persons who constituted the Select Committee a commission which would have enabled them to administer oaths; but two members out of five, representing the Parliamentary Opposition, refused to become Commissioners, on the ground that their services were due to the House of Commons, and not to a Ministry in which they had no confidence. The journals which were hostile to the Government now insisted on a fresh Parliamentary investigation, and on the prolongation of the Session for the purpose of the inquiry. Petitions to the GOVERNOR-GENERAL to abstain from prorogation had been prepared and presented; and the opponents of the Government have cited numerous precedents of inquiries instituted by the House of Commons of the United Kingdom before the date of the recent Act which enabled the House and its Committees to take evidence on oath. The supporters of the Ministry, on the other hand, contended that it was inexpedient to investigate charges of a criminal nature, unless witnesses who were necessarily of damaged character were rendered liable, if they should make false statements, to the penalties of perjury. The House of Commons had, as they plausibly argued, admitted the same principle in passing the abortive Act by which the Select Committee was empowered to administer an oath. To the objection that the members of a Commission would derive their authority from the very persons who were on their defence, it was answered that Sir JOHN MACDONALD and his colleagues had proved their good faith by their proposal of appointing as Commissioners the members of the Select Committee, and that it was their interest to select a tribunal which would command public confidence.

It was unlucky that the SECRETARY of STATE for the COLONIES should have been compelled to disallow the Canadian Act; but his decision ought to have been foreseen by colonial lawyers. The Imperial Act which constitutes the Dominion confers on the Canadian House of Commons all the powers and privileges which were at the date of the Act possessed by the House of Commons of the United Kingdom. It was evident that the Act which enables Committees of the House of Commons to administer oaths, having been subsequently passed, could not apply to the Parliament of the Dominion. The oversight may easily be corrected by an Act extending to the Canadian House the powers which are from time to time possessed by the Imperial House of Commons; but, even if a Bill had been introduced for the purpose, its provisions could not properly have been made retrospective. Lord KIMBERLEY'S interpretation was so obviously sound that the inconvenience which it has caused in the Dominion has not been attended by remonstrance or dissatisfaction. The Canadian House of Commons might, when in Session, have investigated the Pacific scandal through a Select Committee, or it might have acquiesced in the appointment of a Commission of Inquiry. The GOVERNOR-GENERAL had to choose between the ordinary course of following the advice of his Ministers and the experiment of transferring his confidence to a new Cabinet to be formed from the ranks of the Opposition. It may be assumed that Sir JOHN MACDONALD would not have consented to remain in office if the GOVERNOR-GENERAL had refused to proceed with the prorogation. The members of the Opposition were in the full flow of denunciatory eloquence when the Serjeant-at-Arms, in accordance with the celebrated precedent established by WILLIAM IV., summoned the House to attend the GOVERNOR-GENERAL to be prorogued. It is not supposed that the Ministers have any intention of dissolving the Parliament, as they have already appointed a Commission to proceed with the inquiry into the affairs of the Pacific Railway. Lord DUFFERIN'S well-deserved reputation for political tact and judgment renders it probable that in a difficult crisis

he has been well advised in supporting his Ministers. The invectives to which he may probably be exposed will not disturb his equanimity; but his position in the midst of official advisers who are subject to the gravest accusations will, as long as the inquiry proceeds, be embarrassing and painful. It is possible that Lord DUFFERIN's conduct may have been influenced by a disbelief of the charges of corruption. The acquittal on satisfactory grounds of the inculpated Ministers, and especially of their chief, would be in the highest degree gratifying to all who wish well to Canada. The next best result of the investigation would be the exposure and punishment of the guilty; but if the rulers and chosen representatives of a great community are open to vulgar bribery, there is too much reason to fear that the social and political organization is corrupt. In the neighbouring Republic official dishonesty has for some time past excited no surprise and but faint reprobation.

The conciseness and violence of the language in which the Canadian journals denounce the scandal at first provoke incredulity as well as repugnance; but it is impossible to deny that a case for rigorous investigation has been already established. Sir HUGH ALLAN's confessions are confirmed, notwithstanding some variations of detail, by the statements of his American accomplice M'MULLEN; and Sir JOHN MACDONALD, while he repudiates in general terms the charge of complicity, admits that some of the published documents are genuine by stigmatizing other parts of the correspondence as forgeries. He adds, indeed, that the genuine papers are so used as to produce a false impression, but it would have been easy to specify the documents which are declared to be spurious. The most damaging evidence consists of an alleged telegraphic despatch, in which Sir JOHN MACDONALD is represented to have pressed Sir HUGH ALLAN for an immediate payment of 2,000*l.*, as a final instalment of a larger sum. ALLAN himself asserts that he had paid nearly 70,000*l.* for the purpose of returning Ministerial candidates at the general election, and that he claimed to be reimbursed by his associates in the Pacific Railway. The Government of which Sir JOHN MACDONALD is the most conspicuous member had agreed to make the concession of the railway on terms which are stated by its opponents to be unduly liberal; and if the message to ALLAN is not either repudiated or fully explained, it is difficult to understand how Sir JOHN MACDONALD can establish his innocence. The right of reserving a defence, which belongs to all persons accused of a crime, is not judiciously exercised when the charge is wholly unfounded. If the telegraphic message is not a forgery, it must admit of some explanation, and the most obvious interpretation will be generally adopted, unless it is speedily displaced.

Lord DUFFERIN will undoubtedly feel it his duty to take care that the Commission is properly constituted, and that it commences and completes its inquiry with due despatch. The Ministers are perhaps for the present entitled to the benefit of the presumption that the GOVERNOR-GENERAL believes the charge of corruption to be unfounded; yet it is possible that he may have pushed constitutional scruples so far as to refuse to take notice of guilt until he has official cognizance of a conviction. The provisional opinion of the House of Commons has, in consequence of the immediate prorogation, not been ascertained; and it is barely possible that a party majority may have both believed in the truth of the charges and determined nevertheless to support the Government. It is quite certain that Lord DUFFERIN's inclination would lead him to break off all connexion with a Minister whom he suspected of corruption; but, as a constitutional representative of the Sovereign, he might be compelled to acquiesce in a Parliamentary condonation of guilt. In the United States moral qualities are not thought indispensable conditions of political success. The most notorious of American politicians is now a candidate for the highest office in the State which specially affects moral as well as religious puritanism. If Sir HUGH ALLAN's statements are true, several members of the House of Commons were returned through bribery exercised by the Ministers, and they may perhaps be resolved to fulfil their bargain. The GOVERNOR-GENERAL might have appealed to the electors; but he could have no opportunity of consulting the present House of Commons unless he had first dismissed his Ministers, who may perhaps still be supported by a majority. One of the numerous disadvantages of the scandal which has occurred will probably consist in the postponement of the enterprise from which it has arisen. Any concession which may hereafter be made will be tainted

by suspicion, if it is proved that the most eminent members of the Canadian Government and Parliament have contaminated themselves with political corruption, though they are not accused of accepting bribes for their own use.

THE CHANCES OF THE FUSION.

THERE are two theories as to the meaning which the Count of PARIS attaches to his visit to the Count of CHAMBORD. The first is that the step he has taken marks the abdication of all pretensions to the throne, either now or at any future time, except in the character of the heir of HENRY V. According to this view, the Count of PARIS has studied the position of parties in France, and has come to the conclusion that a Restoration is impossible unless there shall first have been a genuine reconciliation between the two branches of the Royal House. Such a reconciliation clearly implies that the head of the elder branch shall be able to count on the inaction, to say the least, of the head of the younger branch, no matter what may happen. There could be no real harmony between the two Pretenders if the one knew that the other had only withdrawn his claims for the moment, and was waiting to trip his rival up as soon as he made a false step. The Count of PARIS has recognized his cousin not only as the head of the House—which means nothing—but as the sole representative of the hereditary principle in France, which, in any natural acceptance of the words, means a great deal. When the Count of PARIS, who for the best part of his life has been the representative of a hostile principle, makes a formal recognition of the hereditary principle, it is difficult to see how he can cancel this recognition hereafter. The hereditary principle is not a thing which can be accepted one moment and rejected the next. So long as it is not challenged, it may be submitted to in a sort of *de facto* fashion which pledges its adherents to nothing. But when it has been discarded for more than a generation, and when the person who accepts it after that interval is himself the embodiment of a principle based on its overthrow, is it possible that this acceptance should be anything else than a repentance not to be repented of? If this is the light in which the Count of PARIS regards his act, in what light are we to regard the Count of PARIS? It seems to be the fashion among the enemies of the Fusion in France to say that he has insulted the memory of his grandfather. But it would be an intolerable burden on princes if they were for ever obliged to abstain from doing or saying anything which implied that their grandfathers had not been models of political wisdom and virtue. It is usually set down to the credit of a prince that he is more liberal than his grandfather; and, supposing the change of opinion to be honest, there is no reason why it should be less a credit to him that he has become less revolutionary than his grandfather. If the Count of PARIS thinks the Revolution of 1830 a blunder, and holds that Monarchy is an institution which may be taken or left, but which, if taken, must be taken without conditions, he is perfectly right in avowing it. Whether he has not been guilty of a grave political error in forming this opinion is another question. It is very hard to understand how, in the judgment of a Liberal, such as the Count of PARIS has always been, and, as is understood, still declares himself to be, absolute Monarchy can ever be the alternative to constitutional Monarchy. The gulf between the two ideas is infinitely greater than the gulf between constitutional Monarchy and a Republic; and, if the Count of PARIS has come to the conclusion that constitutional Monarchy is in France an unattainable good, it is to a Conservative Republic that he might fairly have been expected to transfer his allegiance.

It may be said that the restoration of the Count of CHAMBORD would not be the restoration of the absolute Monarchy. But in what does a restoration in which the Crown is offered without conditions, and, as is perfectly well known, would not be accepted if it were offered in any other way, differ from an absolute Monarchy? The devices by which the Fusionists hope to overcome the resolution of the Count of CHAMBORD not to make any terms with the Assembly imply that he himself sees no difference. According to the most probable account, the plan of the Fusionists is to bring forward two resolutions, one declaring that legitimate and hereditary Monarchy is re-established in France, the other appointing a Committee to draw up a Constitution, and proroguing the Assembly for two months. As soon as the first resolution has been passed, the Count of CHAMBORD

will publish a manifesto in which he will accept the Crown—thus becoming King without conditions—and setting forth the principles on which he intends to govern. It is hoped that under the influence of prosperity, and the persuasion of his new adherents, these principles will be tolerably Liberal, and so will admit of being incorporated without much difficulty into the new Constitution. But the King will not reign by virtue of their being liberal; he will reign by virtue of his own legitimate and hereditary right—a right which will in no way be the creation of the Assembly, but will have been recognized by the Assembly as pre-existing. If the Count of PARIS has brought himself to acquiesce in this view, can the Orleanists as a body be trusted to follow his example? A week ago this seemed almost beyond belief, but M. JONX LEROYER's article in the *Journal des Débats* goes far to shake our incredulity. The substance of this article is that, as the Radicals have been foolish enough to try to set up the Republic without the aid of the Conservatives, the Conservatives now intend to let the Republic take its chance, and either fail altogether or be altogether Radical. If this is the intention of those who until yesterday called themselves Conservative Republicans, still more may it be the intention of those who have never formally christened themselves Republicans at all. In that case, supposing the Fusion to continue unimpaired, the present establishment of the Republic will be attended with difficulties which may prove too much even for M. THURM'S immense Parliamentary skill and still great popularity.

The other theories as to the meaning which the Count of PARIS attaches to his visit would appear altogether impossible if it were not attributed to him by some of his own adherents. According to this view, the Count hopes in the end to bring France round to his opinion that a constitutional Monarchy is the best form of government. But, inasmuch as the majority in the existing Chamber is not Orleanist, and includes indeed many Legitimists who would prefer anything to an Orleanist restoration, this process of bringing France round must be a gradual process. It is easier, he thinks, for an absolute Monarchy to become a constitutional Monarchy than for a constitutional Monarchy to be developed out of a Republic, and therefore he has determined to be no longer an obstacle to the restoration of an absolute Monarchy. If this restoration is successful all will go smoothly. By and by, either soon by his cousin's abdication, or late by his death, the Count of PARIS will mount the throne and be able in person to superintend the constitutionalizing process. If the restoration comes to nothing, the Count of PARIS will be in no worse position than before. He will be able to claim the credit of having done all he could to make the reign of HENRY V. practicable, and to say that the result has shown that, even in exceptionally favourable circumstances as regards Orleanist support, it is not practicable. So far is he from insulting the memory of his grandfather, that he has given the best proof of respecting it by studiously following his grandfather's example. LOUIS PHILIPPE was the obedient subject of LOUIS XVIII., and, until his time came, of CHARLES X. All that the Count of PARIS has undertaken is to be the obedient servant of HENRY V. until his own time comes. And when is that time so likely to come as when France, convinced that a restoration of the elder branch is not to be borne, and still terrified at the thought of a Republic, turns and sees the Count of PARIS constitutional and convenient as ever? If this is at all an accurate version of the Count of PARIS's views, the prospects of the Fusion are not very encouraging. Before anything important can be done, there must be a working reconciliation between the Legitimist and the Orleanist parties, as well as between the Legitimist and the Orleanist Protenders, and how can a working reconciliation be effected if the Legitimists are convinced that the Orleanists are fully prepared to fight for their own hand the moment that an opportunity presents itself? It is just conceivable that the Orleanists may act so much like life as to dupe the Legitimists into believing them sincere, while all the time they are playing a double part. But traditional hatred is usually an admirable eye-salve, and it is far more likely that the Legitimists will think the Orleanists false when they are really true than true when they are really false. Some decisive question must speedily present itself upon which the Orleanists cannot yield without compromising themselves with the country or stand out without compromising themselves with the Legitimists. It may be the flag, as, according to rumour, has actually proved to be the case, or the terms in which the resolution re-establishing Monarchy shall be expressed, or the order in which

the re-establishment of Monarchy and the establishment of a Constitution shall be taken. But whatever it may be, and whenever it may present itself, such a question will subject the Fusion to a very rough test—a test that nothing short of perfect honesty on the side of the Orleanists will enable it to endure. It seems so improbable that the Count of PARIS should not have foreseen all this, that we are still of opinion that the first explanation of his motives is the most probable one, and that he has deliberately embarked in the same boat with his cousin, and staked their united fortunes on the issue of this single voyage.

SPAIN AND HER NEIGHBOURS.

AS a disorderly household generally becomes an nuisance to the neighbourhood, the universal anarchy of Spain has already produced complications with foreigners. Carlist batteries have, intentionally or otherwise, molested French and English vessels. German and English commanders have seized and disarmed insurgent men of war; and a simpler issue has been raised by the probably unwarranted capture of the *Deerhound* and the imprisonment of the officers and crew. With the Carlists and with the insurgents at Carthagena there is a certain difficulty in dealing without affording an indirect recognition of their belligerent character. The seizure of the *Deerhound* was effected under the authority of the Government of Madrid, which for certain purposes must be held to represent the nation. If the facts have been correctly reported, the English Government ought peremptorily to insist on the release of the vessel and of the crew, with compensation for a lawless imprisonment. The French Government also will have a right to redress if it is true that the ship was taken within French waters. It is more probable that the capture occurred in the open sea; but it is still possible that it may have been effected within the Spanish jurisdiction. As the *Deerhound* was engaged in the transport of arms and ammunition of war for the use of the Carlists, the officers and crew would be liable to the penalties of civil or martial law if they were seized within three miles of the Spanish coast; nor would there be any sufficient ground for disputing the legal forfeiture of the vessel. Beyond the boundary of Spanish waters, the capture would be as illegal as if it had been effected in the Straits of Dover. The belligerent rights of the Carlists have been recognized neither at Madrid nor in London; and the right of seizure of contraband can by no possibility arise until a state of war has arisen. If there had been any previous doubt of the established rule, the English interpretation of the law has been finally settled by a vigorous despatch, signed by Lord MAMMETER and generally attributed to the late Lord DERRY, in the case of the *Cagliari*, which had been captured at sea by a Neapolitan man of war. The ship was Sardinian, but some English subjects on board were seized and imprisoned on the charge of participation in an intended insurrection in Naples. The English Government, after some negotiation, compelled the Neapolitan Government to release the prisoners, and to give them full compensation. The question was not whether the charges against them were well founded, but whether they had been captured during time of peace in the open sea. If the *Deerhound* was not within Spanish jurisdiction, the moral culpability which attaches to the abettors of a foreign civil war can furnish no legal excuse for lawless interference with the English flag. The Spanish cruiser had no right to detain or to search the ship, and the capture was on this hypothesis utterly illegal. Even if the circumstances had been different, and the capture for carrying contraband of war had consequently been regular, the subsequent punishment of the officers and crew would have been wholly wrongful. The case of the *Deerhound* affords a curious and valuable illustration of the expediency of the celebrated Proclamation which recognized the belligerent rights of the American Confederacy at the beginning of the Civil War. It was for the purpose of preventing untoward occurrences of the kind that the English Government, at the instigation of Mr. FORSTER, who acted as a Federal partisan, announced its neutrality between the contending parties. From that time the Federal cruisers were entitled to seize contraband of war destined for the Confederates under the English flag, as well as to proclaim and enforce blockades of the Southern ports. Although the measure afterwards provoked the most captious and urgent reclamations, it rendered impossible such a miscarriage as the irregular capture of the *Deerhound*.

The strange proceedings on the Eastern coast of Spain will happily not produce any international misunderstanding, if a Spanish Government ultimately survives the chaotic confusion of the moment. The Ministers at Madrid, as soon as the insurgents at Carthagena had seized a considerable part of their fleet, adopted the strange course of denouncing the rebel cruisers as pirates, and of requesting foreign naval commanders to deal with them accordingly. If they had been taken at their word, they would have had no right to remonstrate even if the German and English squadrons had sunk the ships which they afterwards temporarily detained; but the Spanish nation would have justly resented an unfriendly act, although it might have been perpetrated at the request of a bewildered Government. Commodore WERNER has been disavowed and recalled by his superiors for a less violent interference in the civil commotions of Spain. He is dismissed because, though a gallant sailor, he is undoubtedly a hasty politician. His professional instincts inspired a natural feeling of contemptuous indignation when he met a squadron sailing under an unknown flag for questionable purposes, and manned by a discreditable rabble of mutineers. General CONTRERAS and his vessels were in truth engaged in one of the most illogical and anomalous enterprises which have ever been attempted even by Spanish adventurers. As the champion of municipal and local independence, he was occupied in cannonading the towns on different parts of the coast because they had not submitted to the novel sovereignty of Carthagena, or rather because they hesitated to pay tribute to the unceremonious invader. The expedition bore something of a piratical character; but in the ordinary sense of the words any Government which possesses an army and a navy is not a mere gang of maritime freebooters. Commodore WERNER, with the subsequent aid of an English naval commander, took the rebel ships back to Carthagena, where the crews were disarmed and landed, while General CONTRERAS remained a prisoner on board the German man-of-war. The Madrid Government immediately thanked the German Government for the interference; but their Minister at Berlin was at once informed that Captain WERNER had acted without instructions; and his recall has since furnished a sufficient comment on the policy of his Government. Prince BISMARCK appears as usual to have exercised a sound judgment, and his action has at least been consistent. Having never recognized the Republican Government, he has no official knowledge of the illegality of any rebellion against the authority of Madrid. General CONTRERAS is evidently not a pirate, but a political pretender, who may possibly establish by success the legitimacy of his claims. It was natural that Captain WERNER should be anxious to chastise mutineers; but he ought to have known that it was not his business to defend the Republican Government. If he had confined himself to an effective protest against the bombardment of Almeria or Malaga, his proceedings would perhaps have been approved by his Government. The English officers who concurred in Captain WERNER's vigorous measures have not incurred similar censures. Although the English Government has suspended its recognition of the Federal Republic, it draws a distinction between the ostensibly regular Government of Madrid and the various Juntas or cantonal knots of insurgents which are every moment springing up and bursting like bubbles in a whirlpool. It is said that the English Admiral has been ordered to surrender to the Republican authorities the captured vessels; and the Carthagena insurgents will have little opportunity of resenting a proceeding which undoubtedly violates strict neutrality. The chances are that CONTRERAS and ROQUE BARCIA will be in a short time convicted of treason on the proverbially conclusive evidence of failure. It is scarcely possible that the municipal independence of Carthagena or Murcia should expand into a *de facto* sovereignty of Spain. At the worst the insurgents will not be disposed to enforce their claim to recognition by prosecuting an unnecessary quarrel with England.

It is still doubtful whether Carthagena will be retaken, although the Government forces have inflicted a severe defeat on CONTRERAS. The timidity of the general who was employed against Valencia enabled the garrison of that place to retire at leisure with their arms; and it is thought that some of them will reinforce their rebel confederates. Several men-of-war fully armed are moored in the harbour ready to assist in the defence of the town, and the forts are reported to be formidable. There is indeed always a chance of treason against the traitors; and it is rumoured that the

commander of one of the forts has declared himself independent of the insurgent Government; but if the people and garrison display a moderate amount of courage, the Republican troops will have a difficult task. It is impossible to starve a town which has free access to the sea; and the Republican fleet has already found it prudent, after losing a few men, to retreat to Algeiras. The Central Government cannot count on the tranquillity of any town or province. As fast as the troops are withdrawn after the suppression of a local rebellion the party of disturbance will be ready once more to proclaim their independence. The only consolation for incessant military mutinies is that malcontent soldiers revolt, not to fight against the Government, but for the purpose of avoiding fighting altogether. During the latter period of the Monarchy, Republican patriots pursued with marked success the great object of demoralizing the army. The Cortes at Madrid has lately voted a levy of eighty thousand men; but the few recruits who are likely to be forthcoming will not fail to adopt the mutinous propensities of their veteran comrades or predecessors. In the midst of a promiscuous and many-sided civil war the English Government ought as far as possible to observe strict neutrality, and to compel all the numerous classes of combatants to respect the rights of English subjects. The manufacturers of Sheffield must bear with patience the Carlist investment of Bilbao, where they have invested a large capital in the hope of obtaining a supply of the best iron ore. Merchants and settlers in the maritime towns of Spain may reasonably expect protection from wanton bombardments by roving rebel squadrons. It will not be expedient to repeat the exploit of Captain WERNER. A Government which cannot ensure the possession of its own fleet must take the consequences of its weakness. It may be right for once to surrender to a Republican admiral the ships which were taken from the Communists; but for the future he ought to take care of his own vessels.

SIR SAMUEL BAKER'S EXPEDITION.

SIR SAMUEL BAKER, though it is ridiculous to compare his exploits with the achievements of CORTES and PIZARRO, has proved himself a bold and able adventurer. On a small scale the annexation of Unyoro bears some analogy to the conquest of Mexico; and in one respect the modern invader was comparatively at a disadvantage. Although CORTES led from Tlascala a large force of the hereditary native enemies of the Mexicans, his victories were chiefly owing to the indomitable courage of a few hundreds of Spaniards. BAKER has not a single English or European soldier in his train, which consists in various proportions of Egyptians, Arabs, and negroes. His body-guard, facetiously called the "forty thieves," possess in addition to their moral qualifications forty-six Snider rifles. The remainder of the force varies from time to time; but the regular and irregular troops seem never at the utmost to have exceeded the number of seven hundred. The barbarous chiefs in the interior are friends or enemies according to circumstances. One of them, having attempted to poison the invaders, was justly dethroned for the benefit of a rival who professedly acknowledges the supremacy of the KHEIVIE. In old maps the province of Egypt is depicted as extending nearly to the line of the Tropics. In later times the Viceroys have advanced their power further to the South; and now Sir SAMUEL BAKER professes to have extended their dominions beyond the Equator. English geographers doubt the statement which he repeats on native authority, that the two great lakes of the Upper basin of the Nile are connected by a water communication. If it should hereafter be found that there is an uninterrupted navigation, the establishment of a small fleet of steamers on the lakes would enable the rulers of Egypt to maintain their supremacy over the neighbouring districts. It is hoped that LIVINGSTONE may at last discover the source of the Nile beyond the lakes, and ultimately the entire valley may perhaps become subject to the KHEIVIE. It is possible that the imperfect and borrowed civilization of Egypt may be better suited to the government of savages than the higher cultivation of Europe. Sir SAMUEL BAKER may perhaps prove to have been the unconscious missionary of Mahometanism among the negroes of Central Africa. Although it may be unfair to judge of the spirit of the indigenous faith by the King of UNYORO and his jars of poisoned cider, conversion to the creed of ISLAM, whether forced or voluntary, might produce an improvement on native systems of divinity.

In April last Sir SAMUEL BAKER regarded the results of his arduous enterprise with unqualified satisfaction. The natives not only rejoiced in the protection of the Government, but even paid their taxes cheerfully; the slave trade was at an end, and Egypt extended to the Equator. If the Egyptian Government is earnest in its desire to suppress the slave trade, the control of the Upper Nile will facilitate a task which might be effectually accomplished by closing the markets. If the officers of the KHEDEVE had not connived at the trade, it would long since have been reduced to small dimensions. As Sir SAMUEL is about to return to England after the completion of his mission, there will be no sufficient security for effectual supervision; and unless Egyptian governors are maintained in the territories which have been nominally annexed, the transient victories of the adventurous Englishman will leave no lasting result. The new King of UNYORO will either be dethroned in turn by his rival, or he will revert to the same practices; and, if occasion arises, he will poison his cider. The first condition of the improvement of the country is the total suppression of the slave trade. The English treaty which has lately been imposed on the Sultan of ZANZIBAR will place great difficulties in the way of the maritime trade; and perhaps the influence of the Egyptian Government may be applied in the same direction. Sir SAMUEL BAKER'S marches must have brought him within a moderate distance of Zanzibar; and probably the slave traffic in the neighbourhood of the Equator is distributed between the valley of the Nile and the coast. As long as domestic slavery exists in Egypt as in other Mahometan countries, it is not to be expected that the supply of slaves will be heartily discouraged by the customers who produce the demand; but it is something to have induced the Egyptian Government, by the pressure of European opinion, to have included the abolition of the slave trade among the professed objects of its Southern enterprise. When the KHEDEVE entrusted an Englishman with the command of the expedition, he gave ample proof of his immediate sincerity. Sir SAMUEL BAKER would neither have accepted nor have obeyed instructions which involved any toleration of the obnoxious traffic. By the actual or nominal annexation of the equatorial portion of the Nile basin, the KHEDEVE has made himself more directly responsible than in former times for the abolition or discouragement of the slave trade. No benefit which could be conferred on his new subjects would be so great as the extirpation of the Arab traders and their native associates.

It may be assumed that Sir SAMUEL BAKER'S conquests have been effected in the name of the SULTAN, although they will accrue to the benefit of the KHEDEVE. The negro chiefs of the interior will scarcely appreciate the distinction between the Sovereign and his powerful feudatory. The recent patent or firman renders the supremacy of Constantinople less burdensome to Egypt; nor is there any probability of dispute as to the tenure of the conquered districts. Whether the KHEDEVE was justified on moral principles and by international law in invading the territory of his barbarous neighbours is a question of little importance. As a general rule, it may be fairly contended that any Power which believes itself civilized is entitled to impose upon adjacent barbarians the advantages which it enjoys. The conquest of Unyoro is nearly as justifiable as the conquest of Khiva, though it is not likely to be equally effective and permanent. The countrymen of the successful leader may reasonably feel pride in his victories. The organization and guidance of half-civilized auxiliaries seems to be a task well suited to the English genius. In Africa, as in India, the natural gift of authority is recognized by the corresponding tender of obedience. The commission from the Egyptian Government acquired validity through the proved competence of the English chief to exercise command. The employers of such officers as Sir SAMUEL BAKER entertain with reason perfect confidence in their loyalty and in the good faith of the English Government, which has assuredly no selfish designs in Central Africa. Subordinate French functionaries who interposed difficulties in the way of the Zanzibar negotiation were probably influenced by obsolete impressions of the English desire for aggrandizement. The Egyptian Government well knows that an Englishman who accepts its commission has no indirect object to effect for himself or his country. As philanthropists, the people of England wish well to the inhabitants of Africa, as to every population in the globe; and in their commercial capacity they would be glad to open

markets which are necessarily dependent on the maintenance of a certain degree of discipline and order. If English calicoes should hereafter find access by the Nile to the far regions of the interior, some part of the benefit which will result to producers and consumers will be due to Sir SAMUEL BAKER.

The maintenance or extension of the recent conquests may perhaps at some future time involve complications between Egypt and Abyssinia. Since the close of the creditable and costly expedition to Magdala little has been known of the domestic or foreign affairs of a country with which, as experience has proved, it is desirable to have as little intercourse as possible. Sir S. BAKER'S concise correspondence contains no reference to the independent nation which he left to the eastward on his advance to the Equator; yet it is hardly probable that the rulers of Abyssinia could regard with indifference the extension of the dominions of an unfriendly neighbour. A claim to the sovereignty of the basin of the Nile and its affluents would include the Abyssinian kingdom; and, although the Egyptian Government may at present entertain no designs of aggression in that quarter, there have been many frontier disputes, and much natural jealousy. The unlucky King THEODORE was anxious to obtain from England a guarantee against Egyptian encroachments; and during the campaign it was thought prudent to decline the aid which would have been readily afforded by the VICEROY. There is no reason for regarding with special interest any possible disputes or wars between two remote States, but the participation of English officers in an Egyptian invasion of Abyssinia would not be popular or judicious. It oddly happens that the Abyssinians are the only population in the uncivilized world which nominally professes Christianity. It is not known whether they derive any moral or intellectual advantage from a probably corrupt and degraded form of religion, but English concurrence in a conquest of Christians by Mahometans would not be regarded with favour. For centuries the creed of Abyssinia has been stationary and incapable of proselytism, while Mahometanism, which has elsewhere reached its limits, is still progressive in Northern Africa. If Abyssinia is at any time opened to European civilization, it would be a more hopeful task to purify and reform a faith which has locally degenerated into superstition than to convert the votaries of a hostile creed. As the military resources of Abyssinia are known to be contemptible, it is not improbable that the Egyptian Government may hereafter attempt to annex the whole or a part of the country; yet, if the KHEDEVE and his successors are well advised, they will value their present exemption from the necessity of governing or persecuting the professors of an alien religion.

GENERAL DUCROT.

A THIRD volume has been published of the evidence taken before the French Parliamentary Committee appointed to inquire into the history of the siege of Paris. Many of the witnesses have much to say which even at this distance of time is interesting and important; but the evidence of General DUCROT stands alone in its bearing not only on the history of France three years ago, but on the present and the future of French politics. Nothing, so far as we are aware, has been published which sets before the reader so vividly and so completely the sentiments and opinions which animate those who support and impel the present Government of France, and who are totally opposed to the system of M. THIERS, not so much from a wish to favour any particular set of dynastic intrigues, or to give the clerical party a triumph, as because they think that a Government of repression and of unrelenting hostility to Republicanism is the one thing to save the country. General DUCROT commanded the army of Paris until very shortly before the end of the siege; and, although he admired General TROCHU, and was perfectly loyal to him, he thought that TROCHU went altogether on a wrong plan in his relations with the authorities, supreme or municipal, by whom he was surrounded. TROCHU maintained persistently that he must rely on moral support, that he must keep on good terms with the Government of the 4th of September, and humour the Parisians, if an internal struggle which might place Paris at the mercy of the Prussians was to be avoided. DUCROT laughed at the notion of moral support; he despised and hated the Government of National Defence; he

wished to put down insurrection by force, and did not care how soon an opportunity of resorting to force was used. He wished to make an example which would frighten and tranquillize the insurrectionary bands of Paris. He was totally opposed to the enlistment of all the ragamuffins of the city under the name of National Guards. He wished to rely only on the regular troops under his command, and on select regiments of National Guards formed exclusively of persons of some wealth and education. The rest of Paris was simply to wait in total inactivity until it was announced what the military authorities had thought proper to do. There were to be no meetings and no journalism allowed. Paris was not to be stimulated to make a general effort at an heroic defence. It was to be kept in the most rigid state of siege; to say nothing, to hear nothing, and to do nothing, while those who were fit to act took such steps as they might think advantageous both as to fighting and as to treating with the enemy.

TROCHU sympathized to a certain extent with DUCROT, and was on more than one occasion on the very verge of letting DUCROT act as he wished; but he was still more accessible to the suggestions of those whom General DUCROT usually styles "Ces gredins," and who persuaded him that to provoke an internal struggle in Paris while the foreigner was at its gates would be a grievous crime against his country. What General DUCROT endeavours to prove is that, on each important occasion when the counsels of his adversaries prevailed, a distinct and perceptible evil consequence ensued. The revolutionary attempt of the 31st of October naturally supplies one of the instances on which he comments. On that occasion he as nearly as possible had his own way. What he wanted to do was, with a certain number of regular troops and Breton Mobiles, to attack the Hôtel de Ville, disperse the insurgents, shoot their leaders, and then make such an example of known revolutionists the next day that they would not be likely to give much trouble any more. It is true, as he candidly points out, that JULES FAVRE and other members of the Government were then in the hands of the insurgents, and would infallibly have been shot on the spot if the Hôtel de Ville had been attacked as proposed. But this was a matter to which General DUCROT attached no importance whatever. They would have been shot, and that is all that is to be said about it. DUCROT had actually got TROCHU's permission to advance, and at DUCROT's suggestion TROCHU had appointed ROGER DU NORD as commander of a trustworthy portion of the National Guard that was at hand, when JULES FERRY arrived, declaimed against the bad political effect the appointment would have, drew TROCHU aside, talked him over, and persuaded TROCHU to revoke the appointment of ROGER DU NORD, and make him, JULES FERRY, commander of the National Guard instead. The consequence of this astonishing instance of TROCHU's vacillation was that JULES FERRY went to the Hôtel de Ville, bargained with the insurgents, and released and restored their arms to over two hundred men who had been arrested by the Mobiles. The elections immediately followed, in which an almost unanimous vote was given in support of the Government; but General DUCROT maintains that a very large proportion who gave their votes in this way did so in reliance that TROCHU must have seen by that time that nothing could save Paris except his assuming the dictatorship, and that when, from his characteristic weakness or his honourable scruples, he declined to use the opportunity, those who were ready to support him fell off from him, and he never afterwards enjoyed power or popularity.

The most serious mischief which was caused by TROCHU's failure to make a decisive stand against the revolutionary element in Paris was, in the opinion of General DUCROT, that the opportunity of treating with the enemy on reasonable terms was thereby lost. The noisy foolish populace cried out for war to the death, and TROCHU was, as he thought, obliged to respect this manifestation of popular opinion, and to decline further negotiations. The outbreak of the 31st of October entirely changed the temper in which Prince BISMARCK had been prepared to treat, and he would not hear of anything but an armistice without Paris being allowed to supply itself with provisions. M. THIERS was prepared to treat on this basis, and he told DUCROT that if peace was made then, the Prussians would be content with Alsace and two milliards; but that if the war was protracted, they would want Lorraine also, and five milliards instead of two, so that M. THIERS must have been prepared long beforehand for the terms on which peace was ultimately concluded. General DUCROT

entirely declined to be a party to making terms on the conditions proposed. He wanted his army to do something great and striking, so as to save the honour of France, and then he prophesied the enemy would be willing enough to treat. He says that his prophecy was fulfilled, and that after the sortie on the side of the Marne proposals were actually made to him by the Germans for negotiations, but TROCHU, in order to humour the absurd public opinion of Paris, assumed an attitude which rendered all negotiations impossible. During the last month of the siege the leading members of the Government were bent on having a grand sortie of the National Guards. All the military men consulted unanimously answered that the attempt was sheer madness, and must lead to a useless and terrible disaster. But DUCROT says that those who insisted on the sortie assured him that public opinion would never permit peace to be made until ten thousand National Guards had been killed. DUCROT replied that his conscience would not permit him to order and execute a sortie merely that ten thousand men might be killed to humour public opinion; and that, moreover, if he were willing to fall in with the suggestion made to him, he did not see how he could possibly carry it out, as, even if he managed to get ten thousand National Guards into a position where, if they fought, they must be killed, they would almost all of them run away, and so public opinion would be disappointed. A disastrous sortie was made under the leadership of VINOT—DUCROT having declined to be responsible for it—and even after that terrible warning the desire to conciliate public opinion was so strong that the Government assembled a number of subaltern officers, and offered to make any one of them Commander-in-Chief who would propose and carry out another sortie, and it was only because no one could be got to take the risk that the Government prepared to negotiate.

Such was the general purport of General DUCROT's evidence, but before it was closed he entreated the Commission to place on record a summary of a speech he made in the Assembly while it was still at Bordeaux. The closing words of this speech were to the effect that he had suffered so much misery at the hands of those who during the siege had the direction of affairs, that he had vowed an eternal hatred towards them. What he had suffered was that he had been compelled to witness the conduct of men called to govern without any capacity for governing, and bowing every moment to the dictation of a set of idle, useless, noisy rascals, whose idiotic utterances were styled public opinion. What is important to notice at the present crisis is the intensity and the grounds of General DUCROT's feelings. He has been afflicted with the sight of incapable men having the country in their power, and listening to the dictation of others more wicked and foolish and ill-instructed than themselves; and the effect produced on his mind has been such that he openly avows that he hates and will ever hate these men, that he glories in the avowal, and is anxious above all things that it should be placed permanently on record. We need scarcely say that we do not share the opinions of General DUCROT, and that we have no sympathy with a man who vows eternal hatred to any section of his countrymen. But the important thing is not that General DUCROT's feelings are wise or foolish, but that they exist. No one can doubt that they exist in the breasts of many other very influential Frenchmen, and that those who entertain them fill up the background in front of which we see parading the wirepullers of Legitimist, Imperialist, and Orleanist manoeuvres. It is impossible to find a more lively picture than is contained in General DUCROT's evidence of the real thoughts and aspirations of those who pulled down M. THIERS and set up Marshal MACMAHON in his stead. Such attempts as that made by M. THIERS to bring about a state of things in which moderate men of different shades of opinion might co-operate to establish a temperate and orderly Government are altogether odious to them. They want nothing of the sort. They loathe the *gredins* who have in their opinion ruined, and would continue to ruin, France. They despise public opinion, moral support, and all such fatal absurdities. They want nothing and respect nothing but what they call "order"; and what order would mean if there were a Government after General DUCROT's heart, and he were its general, is to be read in every line of the evidence he gave before the Commission.

THE ARMY AND ITS DIFFICULTIES.

WITHOUT echoing the gloomy forebodings of the military cranks who are just now filling the air with their dismal voices, it must be admitted that the present condition of the army is, for a variety of reasons, by no means satisfactory. We have been assured on the highest authority that the officers are discontented; and it is known that there are difficulties in keeping up the supply of men which is necessary for the working of the short-enlistment system. The discontent among the officers may be attributed to two causes. On the one hand, a large body of officers resent the withdrawal of the privileges of which they have been deprived by the abolition of purchase; and, on the other hand, the scientific corps are reasonably dissatisfied with a distribution of commands in which their services and qualifications are systematically and persistently ignored. It was of course impossible that an old-established institution such as the purchase of commissions could be abolished without occasioning a good deal of inconvenience and perhaps even hardship to individuals. Up to a certain point pecuniary compensation might be provided, but it is clear that a man who had bought into the army as it was must find himself in a very different position in the army as it is. It is no longer the same sort of army, and cannot be the same sort of army, though it is suspected that the Horse Guards is doing all it can to keep things as they were. Formerly the army was a profession in which a gentleman could amuse himself for a year or two before he settled down to a wife and the management of his property. Officers are now expected to be real working men, they are required to qualify themselves seriously for their duties, and promotion is supposed to depend upon professional fitness. This, at least, is the theory of the army in its new form; and it is not surprising that the theory should not be favourably regarded by the gentlemanly interest which despises brains and abhors anything like close application to regular work. Nobody has ever denied the spirit and courage of English officers, and if modern warfare were a mere question of personal daring, there would be nothing more to be desired. In point of fact, however, war has become an eminently scientific business, and can be safely entrusted only to men who have mastered it as a science. A battle-field has become more than ever like a chess-board, and the results of the conflict are in a great measure determined by the mere positions of the combatants. Personal courage will not alone for loose tactics or ignorance of strategy. The truth is, that an officer must now submit to learn his business like a doctor or an engineer, and for a certain class this rubs a good deal of the gloss off the profession. A considerable number of officers have retired, and if they were not disposed to make the best of the new conditions of service, this was undoubtedly the wisest thing they could do. But the great bulk of the officers are just the same as before, and it is perhaps hardly to be expected that they should all at once settle down quietly and contentedly under the change. They may perhaps derive some consolation and encouragement from the reflection that the chief military authorities have taken every opportunity of showing their sympathy with them, and may be trusted—if they are left to themselves—not to be too precipitate in the enforcement of measures which are calculated to give undue encouragement to professional merit at the expense of social position and family influence. There is, of course, nothing new in the invidious line which is drawn between officers of the Artillery and Engineers and the other officers of the army, but the studied neglect and injustice with which the scientific branches are still treated has become more conspicuous now that the army is supposed to have become altogether a scientific force. It appears that the regimental commander of two batteries of Horse Artillery at Cambock Chase became entitled the other day, as senior officer on the spot, to claim the command of the brigade of cavalry to which he was attached. It was thought necessary, however, to reserve this command for a cavalry officer, and the "gunner" was therefore detached from his batteries under the pretext of performing Staff duties. As he could find nothing to do on the Staff, he has now returned to headquarters at Dorchester. This is only one example out of many of the manner in which Artillerymen and Engineers are systematically treated. It remains to be seen how far the Horse Guards will be able to preserve their pet forces from the spreading taint of intellectual culture and scientific capacity.

Just now the army is in a transition state with regard to men as well as with regard to officers. Sufficient time has not elapsed to enable us to form a positive opinion as to the working of the short-service system; but our experience of it, as far as it has gone, is not very encouraging, and there is unfortunately reason to regard the future with some anxiety. It was anticipated that the reduction of the term of enlistment would, in conjunction with other advantages which were offered to the soldier, bring in a large haul of recruits; but the attractions on which the War Office counted so much appear to have made very little impression on the mind of the class appealed to. It is stated that when men enlist they seldom ask any questions as to the length of service, and when they do ask, what interests them is their chance of remaining long enough to obtain a pension. The Inspector-General of Recruiting reports that many men are now unwilling to enlist "with the uncertainty that prevails as to their being permitted to continue to serve till pensioned under the present short enlistment of infantry." Thus it would seem that, on the one hand, the sort of men who used to enlist with the intention of remaining for some years in the army and earning a pension are now rather deterred by the new arrangements, while those classes which were to be tapped by the short-service system have yielded but a scanty reinforcement. Last year 17,371 recruits were passed into the service, but in the same year there were 18,779 casualties. It appears, therefore, that the supply has fallen short of the numbers required to complete the army by 1,408. In the summer and harvest months of 1872 "the number of recruits taken was the lowest known for several years." In October recruiting rather picked up again, but we have yet to learn how far it has been successful during the present year. High wages in all branches of trade no doubt account both for the reluctance of labourers and artisans to join the army and for the large number of desertions; but there is no reason to suppose that there will be any reduction in the rate of wages in the general labour market, and the influences which affected the recruiting of last year will no doubt continue to affect it in future years. In 1876 the discharge of the first batch of the six-year men will leave a serious gap in the ranks, so that, in the opinion of the Inspector-General, "it is more than probable that the present system of recruiting will fail to supply the necessary demand." There is another circumstance which must also be taken into account. While more and more difficult to get, men are also more difficult to keep. We are told that the casualties of 1872 were increased above the average by a greater number of invalids, an increased discharge of men of bad character, facilities for obtaining discharge by purchase or otherwise, and by many desertions. This hardly speaks well for the character of the men enlisted. There is a dispute as to the quality of the recruits, but it is reasonable to suppose that quality would be affected by the same causes which kept down the supply, and this is confirmed by general observation. It must be remembered, however, that the localization of the army is a necessary complement of the short-enlistment system, and the experiment will not be fairly tested until both parts of it are in operation together. There can be no doubt that, if the new system will only bring in a sufficient number of men, its effect on the country at large, in training and disciplining, and we may add educating, a large body of the youthful population, can hardly fail to be beneficial. Although the present is an anxious moment, there is no occasion for despondency. After all, it is only a question of the cash-box. Soldiers can always be got for good wages.

A return has just been issued which shows that—on paper at least—the numerical strength of the army for home defence is adequately maintained. Last year there was a total force of 101,145 (excluding commissioned officers) on service in the United Kingdom; and this year the number is 98,719. There have been only five years since the beginning of the century in which this military strength has been exceeded; that is, in 1804, 1805, 1807, 1808, and 1810; and it is about twice as much as was thought necessary during the period from about 1820 to 1846. There has been a tolerably steady increase since 1847, when the Duke of Wellington addressed his famous warning to Sir JOHN BURGOYNE, and successive panics have helped the movement. This return was moved for by Mr. VERNON HAROULT with a view, it may be presumed, to demonstrate that the army is at present kept up at a

unprecedented and unnecessary strength. But though the first point is proved, it does not carry with it proof of the second. The question of the sufficiency of the force is not one which can be determined by a simple comparison of naked figures. The circumstances of the country at different periods must be taken into account; and there is at least one obvious reason why a larger army is now required for home defence than in former years. We have got to great wars of a few months or a few days, and the blow of an invasion, if one were ever attempted, would be almost instantaneous. Mr. HARCOURT is sceptical as to the possibility of an invasion, and there are no doubt others who share his opinion. From this point of view, it may be considered almost superfluous to keep up an army at all; but it is obvious that, if invasion is to be regarded as a danger which might really happen, it is necessary to treat it seriously in making our preparations for defence. Besides, it is not only by an invasion that this country might be attacked; events might happen on the Continent which would compel us to resort to arms, and the result of the conflict would depend on the swiftness with which we could bring them to bear on the enemy. It is satisfactory to observe that the army has been strengthened, not only in infantry, but, in a still greater degree, in cavalry, artillery, and engineers.

DEATH IN THE MILK CAN.

IT is seldom that an epidemic is so clearly traced to its cause as in the case of the late outbreak of typhoid fever in Marylebone. The account of the several cases reads like a list of experiments specially chosen to sustain a particular conclusion. The method of difference and the method of agreement are equally illustrated. Wherever a case has seemed at first sight to point to some other origin of the disease than the one assigned, something has almost always been discovered which supplies the missing connexion. In nearly every instance the families in which typhoid fever has appeared have been supplied with milk from the same dairy, and in several of the few instances in which the disease has attacked families not supplied from this dairy it has since been discovered that the sufferers have accidentally been brought in contact with it. Thus in one case the only member of a family attacked was a child who had been away from home and had drunk the suspected milk while on her visit. In another, the patient lives at Norwood, and there has been no typhoid fever in the neighbourhood. But a week or two before she was attacked she had been staying near Portman Square, and there had drunk the milk from the dairy in question. These and many other coincidences are too striking to be set down to accident. They point unmistakably to a particular supply of milk as the cause of the disaster. When the farms from which this dairy obtains its milk came to be inspected, one of them turned out to have all the conditions necessary for the production of typhoid fever. The milk cans were washed with water drawn from a well that "has long been condemned by the medical man as unfit to drink, and is, in fact, obviously impure both to eyes and nose." Considering what the situation of this well is, nothing but a miracle could have kept it pure. It is only eight feet from a ditch into which the pigstyes, the dairy, the manure heap, and the only privy on the premises all drain. Thus the contamination of the milk with sewage is inevitable, and it is further proved that the sewage of the house has lately been charged with typhoid poison. One of the men employed on the farm died there in June with all the symptoms of typhoid fever on him, and his son was ill of the same disease at the time when the farm was inspected. The chain of evidence is thus as complete as need be. The connexion of the cases of typhoid fever with the drinking of a particular milk cannot be disputed, and the contamination of this particular milk by typhoid poison cannot be disputed. It is impossible for any disinterested scepticism to resist such proof as this.

Nor are the conclusions which follow from the facts thus established a matter of much doubt. It is clearly of no use to be careful about the water we drink if the milk which we thus hope to keep out of the system comes in in the milk can. The milk supply of London is now drawn from so large an area that sanitary neglect in Oxfordshire may be as fatal to the lives of Londoners as

sanitary neglect in Middlesex. More and more it is becoming true in these matters that if one member suffers all the members suffer with it. Six serious outbreaks of fever have now been traced to the milk supply. There is nothing to prevent a single case of typhoid fever occurring in any one of half-a-dozen counties from conveying the infection to a whole district of London. It has been so in this instance; it may be so in any number of other instances. The dairy well on one farm became contaminated with sewage in which the typhoid poison was present, and the milk sent up to town in cans which had been washed with the water drawn from this well carried typhoid fever to more than a hundred families. Coming, as the outbreak did, just when everybody was leaving town, many of the sufferers have sickened in other parts of the country, so that unless disinfection is universally practised the infection has been carried far beyond London. The means by which this danger can be guarded against are so well stated in the *London Medical Record* that we shall make no apology for transferring the passage to our own columns:—1. "It is the duty of a milk-vendor who obtains his milk not from his own farms, but by contract with farmers, to make sure that the sanitary condition of the farm is good, and to provide for its inspection from time to time by his own agents or by the local medical officer of health." 2. It is his duty to apply to the milk which he supplies under such circumstances not merely the physical tests of the hydrometer and creaming-glass, which can easily be cheated by the practice of skimming the milk of a portion of its cream, and adding about ten per cent. of warm water, but by a simple chemical test, the estimation of the solids by WANKLYN'S method. 3. It is the duty of the Local Government Board and the rural sanitary authorities, under the Public Health Act, to issue strict directions to medical officers of health and inspectors of nuisances for the supervision of dairy farms and periodical report thereon."

Whether the sellers of milk will recognize their duty of their own free will it is hard to say. Sanitary morality is as yet so undeveloped that many men who would shrink from committing manslaughter with their own hands seem to have no scruple about committing murder by means of the goods they sell. But we will undertake to say that any dairy owners who have the farms from which their milk comes regularly inspected by competent persons, and the results of the inspection regularly made public, and who supply trustworthy evidence that no milk is sold by them except such as comes from these inspected farms, will do an unusually good business. Still traders are often so shortsighted that we do not feel at all certain that this course, plainly to his own interest as it would be, will be adopted by any milk-dealer. The best that can be expected from them perhaps is that they will shut the stable-door when the horse has been stolen, and have their dairy farms inspected after disease has been communicated to their customers. The second of the suggestions quoted above may help, however, to keep the owners of dairies up to their duty. The analysts now appointed or being appointed in every parish should be instructed to apply chemical as well as physical tests to every sample of milk which is brought to them for analysis. They have already done a good deal to check the addition of water to milk; they may now render a still greater service to the public by checking the addition of sewage to milk. In this beneficent work they may be greatly assisted by the Local Government Board. It is to be feared that in some country parishes Inspectors of Nuisances and even Medical Officers of Health may be a little slow in bringing effective supervision to bear on dairies owned by rich farmers. It should be the business of the central authority to see that these local inspections are thoroughly carried out in every dairy farm, and from time to time to test the reports of the local authorities by the personal visits of their own officers. Provision should also be made that, whenever an analyst discovers the presence of sewage contamination in a sample of milk, the seller should be forbidden to sell any more until the farm from which the sample has been brought has been inspected and the flow of contamination stopped. If this last suggestion is objected to as an arbitrary interference with trade, we answer that the sale of poison under the name of food is not a business which it is desirable to encourage. Except in name, there is no difference between selling milk mixed with typhoid sewage and selling milk mixed

with arsenic. Both substances are calculated to cause death, and if drunk, will, in a certain percentage of cases, undoubtedly cause death. The precautions which are justifiable in the one case are equally justifiable in the other, or, if there be any difference, it is in favour of the case which is likely to occur oftener.

Alarming as the communication of typhoid fever by milk undoubtedly is, Mr. ALFRED SMEE has contrived to suggest a more terrible, because more widely spread, source of danger. It has hitherto been assumed that wherever the typhoid poison has been detected in milk it has been communicated to it in water added after the milk has been drawn from the cow. Mr. SMEE contends that the origin of the evil lies further back, and that the milk itself, as secreted by the cow, may be charged with sewage poison—typhoid or not, as the case may be—derived from the food of the animal. If this position could be maintained, the consequences would be exceedingly serious. It has been ascertained that it is impossible to put sewage into water without endangering the health of the community, and if it should turn out to be equally impossible to put it on the land without endangering the health of the community, there will be no way out of the dilemma in which every sanitary authority will find itself. The burden of a sewage which could be disposed of in neither of the only two ways in which it seems possible to get rid of it would be greater than they could bear. Happily, however, Mr. SMEE has yet a good deal to do before he can be held to have made out his case. All that is yet clear is that on two occasions when the cows on Mr. SMEE's land had been fed with sewage grass, their milk and the butter made from their milk soon became rancid. Even if this was shown to be the case with all milk drawn from cows which have been fed on grass manured with sewage, it would not be the same thing as proving that any special poison contained in the sewage can be conveyed to the cow. There seems, however, to be a mass of evidence which Mr. SMEE will find it hard to controvert that sewage grass has not ordinarily the effect which Mr. SMEE attributes to it. One theory which has been offered in explanation of the mischances which befell his milk and butter is that the grass may have been contaminated with sewage particles, the composition of which had not been changed by contact with the soil. If this should prove correct, it will clearly be of great importance that the sewage should be so applied to the land as not to leave any part of it unabsorbed. Other explanations are that the sewage in this case had been stored instead of being laid on fresh, or that the grass had been cut too soon after the sewage had been applied to it, or that the cows were allowed to feed in the open fields after their taste for succulents had been stimulated by the sewage grass, and had eaten rushes or other plants which give a disagreeable smell and taste to milk. Although, however, Mr. SMEE seems to have arrived at his conclusion upon very insufficient grounds the controversy, as to the effect of sewage manure on food, is one of great importance; and it is to be regretted, in the interest of sanitary knowledge, that Mr. SMEE should have allowed himself to conduct it, as regards one of his adversaries, in a manner which, to say the least, is eminently unscientific. Personal abuse and innuendo are the worst possible weapons to employ in a contest which professes to have for its object the establishment of certain truths upon matters of immense interest to the physical well-being of the community. It is to be hoped that in this respect Mr. SMEE will find no one to follow the example which he has so unadvisedly set.

MR. GLADSTONE AT MOLD.

MR. GLADSTONE has invented a new theory. The fact is by no means unprecedented, nor is it entirely without precedent that the theory should be quite satisfactory to nobody but Mr. Gladstone himself. Anybody of less amazing mental activity might have thought it a sufficient feat to add to the multifarious cares of Government the presidency of an Eisteddfod, and might have been content with discharging the duties of the position in as perfunctory a manner as possible. There have been Ministers who would have satisfied themselves and their admirers with a few gentle jokes imbedded in a series of unpretentious commonplaces. Mr. Gladstone, as a matter of course, was quite incapable of taking any duty in such a spirit. He is absolutely blind to the comic side of the proceedings, and takes an Eisteddfod as seriously as though it were a meeting of the Imperial Parliament. To be commonplace, again, would be altogether out of character, and therefore Mr. Gladstone naturally propounds in all earnestness an

historical theory which had never before entered the head of any human being. There are limits, however, even to Mr. Gladstone's powers; and we fear that the novel theory can scarcely have received very mature consideration. Perhaps it sprang to life whilst he was trying to listen with one ear to the rhetoric of some Welsh member; or he struck it off in the interval between the discharge of one duty as Chancellor of the Exchequer and of another duty as First Lord of the Treasury; or possibly it only occurred to him as he was travelling on the railway to meet his audience. Considering what Mr. Gladstone is doing at the present moment, the responsibilities that are weighing upon him, and the infinite number of claims upon his attention, we should not be too exacting. When an acrobat is supporting one man on his right shoulder, and another on his left, whilst half-a-dozen more are clinging to him in various attitudes, one cannot complain if he fails at the same time to keep a couple of balls in the air with a disengaged hand.

The theory itself is not worth very much discussion. The problem which Mr. Gladstone considered was the curious permanence of the Welsh language as compared with the Erse and the Gaelic. The solution which he offered suggests, like most other things in creation, a most instructive lesson. The subject indeed is "full of great lessons to Government, applicable to all subjects and to all people," and the main lesson is that we attempted to "hector the Welsh people into the abandonment of their language," and that, in consequence of this hectoring, they clung to it "with unexampled fidelity." Any number of objections to this theory may be easily suggested. The alleged facts and their connexion may be disputed. The "hectoring" of which Mr. Gladstone speaks consists simply in this—that, since the beginning of the eighteenth century, none but Englishmen have been appointed to Welsh sees, and that livings in Welsh-speaking parishes have been held by Englishmen. Mr. Gladstone's language indeed, as reported, might almost be taken to mean that there had been an absolute disqualification of Welshmen from holding livings in Wales. The real state of the case is of course simple enough, and its effects have been important in their way. The Church of England was in a very sleepy state in the last century, and a great many bishops had very little to do with their sees beyond deriving a handsome income from them. When to this indifference is added the mutual unintelligibility of the bishops and their flocks, it is not surprising that the field was open to Wesley and his followers, and that the consequence has been a great alienation of the Welsh from the national Church. But there is the widest possible difference between this calm indifference and anything that can reasonably be called "hectoring." The people became cold to the Church, but not disloyal to England; as indeed Mr. Gladstone asserts—and we have no doubt with perfect accuracy—that they are as good subjects as the inhabitants of any part of the Empire. An attempt to proscrib a language would have aroused some warmth of national feeling; but no such animal as a Welsh advocate for home rule has been known to history for several centuries. In Ireland the language has died out in spite of much "hectoring" on our part, and much antipathy on the part of the hectoring; and it would be easy to maintain a theory the very reverse of Mr. Gladstone's. A vigorous attempt to keep down native sentiment, we might say, has in Ireland led to the suppression of the language, though much else has survived. Wales, on the contrary, having been once thoroughly conquered, was pretty much left to its own devices, and therefore retained its language. Oppress people strenuously enough and they will in time give way. At the period of the conquest nobody cared to put down the language, and since then the Welsh have been left to themselves. Welsh has survived because the governing race has for many generations not endeavoured to force its customs or religion upon the conquered race.

We do not mean to say that this is the true moral of the case, though it is about as plausible as Mr. Gladstone's; for the causes which determine the decay and growth of languages are infinitely too complex to be thus decided offhand. To give any opinion we should, for example, have to consider the nature of the language itself, and how far it possessed a literature to give it a certain consistency and make its maintenance a matter of interest even to people who could read English. Other obvious considerations are the social and the geographical relations of the people, how far they formed a separate organization, and how far they were a homogeneous race, and how far altered by immigration; what was the nature of their commercial and political intercourse with the outside world, and whether it tended to give a decided advantage to the possessors of the foreign language. Then, again, we should have to inquire into the true nature of the phenomenon under discussion. At what period did this attachment to the native language first manifest itself? Was Welsh more remarkable for its vitality in the last century than Erse or Gaelic? When, and under what circumstances, did those languages begin to decay so rapidly as they are at present doing? If such conditions were reproduced in Wales, might we not expect to see an equally rapid decline of the Welsh language? Then it might be as well to compare the case of other dialects lingering in various parts of the world; of the Manx and the Cornish, for example; of the Basque in France, or of the curious fragments such as the Romansch of the Grisons, which still hold their ground in various Alpine valleys. We do not venture a guess as to the probable result of such inquiries, except so far as to say that in every case the conclusion would probably be that many highly complex conditions determine the survival or extinction of different dialects, and that, as a general rule, such a fact as the appointment of

bishops speaking a different tongue would be found to exercise an almost inappreciable influence. The general proposition asserted by Mr. Gladstone appears to be that "hectoring" a people out of their language is the way to make them love it. We should be inclined to add that it depends upon whether you hector long enough and vigorously and judiciously enough, and whether the hectoring party be decidedly the stronger.

If there be any truth in the hectoring theory, we, as brutal Saxons, have the comfort of reflecting that the Welsh language must be doomed to speedy extinction. We have now decidedly taken to petting instead of bullying; and as the bracing atmosphere of persecution has done so much good to the patient, we must assume that the relaxing effects of coddling will have the reverse influence. Speaking for the moment, not as archaeologists or historians, but from the commonplace point of view of the British tourist, would it not be a very good thing? Is it not rather humiliating for an Englishman taking a few hours' trip to his own scenery, to find a race of fellow-countrymen who can only communicate with him by the language of signs which would be equally available in the centre of Africa? And, indeed, would there be really any great harm to archaeologists if Welsh became a dead language? We derive as much advantage from the study of the classical languages as if Greek and Latin were still surviving in the actual world. Philologists have dreamt very often of a universal language which should supersede all existing tongues. We are apt to shirk with abhorrence at such a proposal; and yet, if it could be realized, would it not be a great advantage? Is it not as desirable to have a means of communicating thought freely throughout the whole surface of the globe as to have a common system of coinage or of weights and measures? If we calmly compare the advantages and the disadvantages of such a consummation, it is difficult to say that the drawbacks would overcome the positive convenience. The conveniences, indeed, are too obvious to need explanation; and what are the disadvantages? That Shakespeare, and Dante, and Goethe should be written in a dialect only intelligible to people of a certain degree of education, and that even to these there should be a distinct loss in fulness of appreciation, is undoubtedly an evil as far as it goes. But we must remember that, in the first place, to the great mass of the people the loss would be infinitely less than common language supposes. It may safely be said that the reading of ninety-nine men out of a hundred, even of tolerably educated people, is confined to writers in their own dialect, and who have lived within the past century. How many authors can be mentioned in English whose works are really familiar to any one below the most cultivated classes a century after their death? Two or three poets, as many religious writers, and a novelist or two would exhaust the list. And, on the other hand, cultivated people can derive as much cultivation from a writer in a dead language as from one in their own. Plato or Cicero has as great an influence upon educated men as Bacon or Burke. Translation can transmit thought, if not external polish. The Bible is with all classes as great a power as if they could still read Greek and Hebrew; and thought does not disappear with the disintegration of the stratum in which it was originally deposited. If the day ever comes in which everybody will talk English, the most rapidly growing of existing languages, perhaps the increase in present comfort will counterbalance the evils produced by the loss of some advantages peculiar to other languages and the diminishing of many great literary luminaries.

We do not, however, profess to discuss so wide a question, to which, moreover, no very definite answer can be expected in less than several centuries. But the conceivableness of such a conclusion suggests that the loss of such languages as Welsh would not be an unbearable calamity. It is a real misfortune to be brought up to speak familiarly a solitary dialect confined to a small district. A man of genius who can only write freely, say, in Dutch, would lose nine-tenths of the audience which would be open to a Frenchman or an Englishman. But if his native tongue were Welsh or Basque, what chance would he have? Cut off from the best sources of inspiration, and deprived of a fitting audience, he must be more than human to produce any worthy fruit. The influence upon the ordinary mind of being thus imprisoned within the four corners of a language with no living literature and little communication from without must be generally a kind of mental asphyxiation. That Welsh should be carefully studied is of course desirable; but that many human intellects should be permanently fettered in Welsh would be a result which, if Mr. Gladstone's theory be true, would show that the victims of persecution are sometimes punished severely for their virtuous, but ill-guided, resistance.

HOLIDAY TRAGEDIES.

NOW that a prince has been nearly drowned, common people who are making holiday will perhaps be taken care of a little, and it is just possible that they may begin to take a little care of themselves. At this period of the year London is conventionally described as empty, but there are three millions and a few odd thousands still left to enliven the solitude, and if any of these should happen to feel morose and ill-tempered at being left behind, they may derive some consolation from reading in the newspapers the histories of those who have gone on their travels. Signalmen and "facing-points" we have with us always, and a railway official has just done his best to encourage railway travellers by assuring them that "railways themselves being danger-

ous, facing-points are to a certain extent an increase of that danger, yet it is one of the necessities of railways that they should have facing-points." We are also told that, if trains went quietly through stations at which they did not stop, the safety of the public might be increased; but then this would not suit the Companies, and therefore officials, speaking as it were over the graves of fifteen slaughtered victims, tell us that they "really cannot say that they would recommend it." Happy-go-lucky, smash and kill, and take your chance of being pursued through two courts for damages, which, if gained by the plaintiff, will have already been pretty well consumed by him in law expenses—this is the policy of the Companies. Have not the passengers—as an eminent railway chairman, who rules we don't know how many Companies, as Ducrow used to ride his half-dozen horses, said the other day—have not the passengers always a chance of not being smashed or roasted alive, and are Railway Companies to be put to expense for all sorts of "fads" for the mere safety of passengers? For our own part, we have heard all sorts of theories as to the duty of railway directors. There are weak people who imagine that they should occasionally bestow a passing thought on the lives of the public. More philosophical persons hold that a director has only one duty, and that is to nurse dividends for shareholders. However this may be, we feel confident that if directors would only withdraw their minds from strategical and speculative pursuits for a short time, and would tot up the cost of killing people, adding in their own law costs and other expenses as well as the damages, they would probably come to the conclusion that it would be almost cheaper to spend a little more in taking care of passengers.

We all take our seats in the railway carriage so much as a matter of course that we scarcely reflect on the likelihood of our forming part of that percentage of disasters which is triumphantly referred to by the railway officials as forming so comparatively small a proportion to the whole body of railway passengers. And considering how hopeless it is, according to railway managers and station-masters, to think of preventing what they call accidents, this is perhaps the most philosophical frame of mind that could be cultivated. Possibly people who have survived one or two railway journeys—for example, on that prosperously homicidal railway, the London and North-Western, where engine-drivers are in the habit of looking back as they pass through certain stations with a feeling of relief when they see actually the whole of their train behind them—may begin to feel reckless and to fancy that they have a charmed life. That unfortunate man who was capsized, with his wife and children, on Windermere, must surely have been under some such impression. Windermere is one of the most dangerous sheets of water in the country. It is exceedingly long, surrounded by low hills with many openings between, and is subject to all kinds of uncertain and treacherous blasts of wind. We should have thought that anybody who knew anything of Windermere must have heard of its notorious reputation as a dangerous place for sailing. In this instance several boatmen had warned the man that it was dangerous to try to cross, and nearly all the other boats had kept to the shore. There was a gusty wind, and the water was chopped and rough. It appears that the boat was caught by a sudden squall when tacking, and capsized. The sheets had been made fast before there was sufficient way on the boat, and she simply toppled over on the instant when the wind came. The jury at the inquest suggested that the Windermere boats should all be provided with life-belts, but in a case of this kind there would be no time to look for them, or to fix them on. To be of any use, the belts would require to be around the waists of the voyagers on starting. It might have been more to the purpose to have recommended people not to go out in boats when the lake was rough, and when experienced boatmen warned them of the danger of tempting the treacherous waters. For any one who does not understand perfectly what he is about, and who is not also by nature one of the coolest and most self-possessed of men, a sail in a small boat is about as reckless a way of tempting Providence, as the old phrase was, as can possibly be imagined. The trim of the sails, the balance of the boat, the least puff of wind, especially in a land-locked sheet of water, require constant and anxious attention, and the slightest flurry may produce the most disastrous consequences. In this instance, it is true, the gentleman who hired the boat took a boatman with him, but the boatman is described as only "an experienced hand as far as boatmen go." Perhaps a special certificate for boatmen would be of more value than a life-belt.

Bathing accidents are still more under control. Indeed there ought not to be even the possibility of a death from drowning at a regular bathing-place during the regular bathing hours. If people choose to go into the sea at secluded spots, or at unusual hours, of course they must take the consequences. But there can be no difficulty in making bathing perfectly safe at appointed bathing-places. Last Saturday two young ladies while bathing at "the usual ladies' bathing-place" at Ilfracombe, and "only half-a-dozen yards from the beach," were overpowered by a sudden rising of the sea and drowned. It seems that the bathing-place is approached only by long tunnels through the rocks, and "both the boatmen in attendance and the only bathing-woman who could swim happened to be away." There was therefore no help at hand, and the poor girls were drowned in the sight of a number of people, who could not even make an effort to save them. We should think that it would be the interest of the

inhabitants and hotelkeepers of Ilfracombe to induce bathers to go there, and it would therefore be worth their while to try to secure the continuous attendance of boatmen, if not also of a bathing-woman who could swim, during the bathing hours. No bathing-coaches should be licensed except on condition that a boatman is kept on the water during the time they are used, as a protection to bathers. Even the best swimmers are subject to cramp and faintness, and are liable to be overwhelmed by the sudden breaking of a rough billow. It should be an unfailing municipal regulation that there should always be a boatman on duty at the bathing-place during certain fixed hours. Ilfracombe is, from its rocky situation, a peculiarly dangerous bathing-place, and yet we find that the boatmen who are supposed to be in attendance are allowed to be absent, and the result is that a couple of young ladies are drowned within a few yards of the beach, and in sight of a crowd of people. Only a few days before a gentleman and a boatman were drowned at the same place, by the upsetting of a boat close to the pier-head, and here again no help was at hand. In another case during the present week a man was drowned at Salcombe. He had gone to assist another man and a boy, and was carried off by a current; but the "boatman who is always on guard" saw nothing of all this till it was too late. At a watering-place the sea is as much frequented as the land, and something in the nature of a sea-police ought to be organized. The beach should also be carefully explored, and all dangerous spots should be indicated by notices or buoys. It would also be natural that the bathing-coaches should be prohibited from taking people out in certain dangerous conditions of the weather. If these rules were observed, it is scarcely possible that accidents, or at least fatal accidents, could happen. But of course bathers should also condescend to think a little of their own safety. They should avoid bathing at strange hours on a beach with which they are not acquainted, and indeed solitary bathing had better always be avoided. There are many parts of the coast which look innocent enough, but which are made dangerous by abrupt rocks, over the edge of which you may plunge suddenly into deep water, or by eccentric currents. Prince Arthur's accident seems to have been due to his ignorance of the strong current of the Seine, which is very strong at a short distance from the shore, and sometimes lays hold of swimmers before they know where they are. At Trouville, as at Biarritz and all French bathing-places which we have visited, there is usually a regular service of boatmen bobbing up and down on the waves just in front of the bathing-places. It is stated that Prince Arthur went out to bathe "unattended at an early hour," and, after swimming out some distance, disappeared under a heavy breaker. The Prince was saved by a waterman and a member of his suite who happened to be at hand; but as there were no boats about, we suppose the Prince had anticipated the regular bathing hours. There are good sands at Trouville, but the waves are often long and heavy, and the currents dangerous.

There is probably something in the exhilaration and excitement of a holiday which accounts for a good deal of the recklessness which may be traced in holiday accidents. People in the fresh glow of health which comes over them on such occasions sometimes describe themselves as walking on air, and we suspect they occasionally forget that they are neither so strong nor so agile as they fancy at the moment, and allow themselves to be tempted into enterprises beyond their powers. The ordinary life of a middle-class Englishman is so narrow and wearisome, he is so hardened with work and fenced about with respectabilities and social ordinances, that when at last there seems to come a momentary opening for the free play of the primitive wild man which is to be found inside most of us, he is apt to lose all control over his prudence, and to fancy himself rather a child of the woods than a citizen of the pavement. As he puts on the wide-awake and tweed coat he flings off the restraints of common caution and reserve, and feels an irresistible impulse towards all sorts of reckless, madcap feats. There is a sort of secret faith that a man can do anything at such a time, eat anything, drink anything, walk any number of miles, or get wet, without suffering any of those personal consequences which might safely be expected at another season. The number of people who every year injure their health seriously, and perhaps permanently, by foolhardiness of this kind, greatly exceeds the number who are killed by falling off steep crags, or by going too far out in rough waters, but it is all part of the same mania. Surely tourists and holiday-makers have every reason to be content with the elaborate arrangements which railway managers make for their destruction without inventing additional perils.

RE-ELECTION OF MINISTERS.

THE question as to the avoidance or non-avoidance of Mr. Gladstone's seat for Greenwich by his acceptance of the office of Chancellor of the Exchequer is one which suggests thoughts that go a good deal further than either the point of law or the point of conventional political propriety which is first started by it. The law which requires a member of the House of Commons who becomes a Minister of the Crown to vacate his seat and to take his chance of re-election is one of a large class of cases where a rule was first made to answer one purpose and is kept on to answer another. Such cases are specially common in our conventional constitution. A rule was laid down long ago under some

wholly different state of things. In process of time it perhaps ceases to secure its original object, or perhaps its original object is one which no one any longer thinks of securing. In such a case the rule may die out or be abolished, or it may linger on as a mere survival, no longer answering any practical purpose at all. But it is just as likely that, in the gradual process of change, the rule may become endowed with a new life, and may still have a highly practical effect, though in some way quite different from that which it was at first meant to have. We are putting our case in a way which is perfectly colourless, because the process of change is exactly the same whether we hold the result of the change to be good or bad. A law ordained for a good purpose may come to work for a bad one; or a law ordained for a bad purpose may come to work for a good one; or there may be endless differences of opinion as to which is the good purpose and which is the bad one, whether, in short, the change is an improvement or a corruption. It is clear, for instance, that the fellowships and scholarships in the Universities do not answer the particular objects which were designed by their founders; it is equally clear that they do answer certain other objects. Whether the change is good or bad, whether the original objects are now either desirable or possible, whether we ought to try to go back to them or to go away farther from them, are questions which awaken warm controversies. But the fact is undoubted; the change has taken place, and it has taken place by the gradual working of circumstances. Particular enactments may have strengthened and hastened it; but they have simply strengthened tendencies which were already at work; they did not give them their start in the first instance. Or take another case more closely connected with our immediate subject. The ancient privilege of Parliament which made it a breach of privilege to publish debates and the like had a real use when there was a chance that the King might send a bold and patriotic member to the Tower. When this danger had passed away, it served for a while the opposite purpose of setting members as free from the control of their constituents as they already were from the control of the Crown. Now it sleeps, to be ever and anon called into life for a moment at the caprice of some individual member. It may possibly be wise to keep such a power in the hands of the House itself; but, if so, it is certainly not for the sake of the object which the privilege was first designed to serve, nor yet for the sake of the object which in after times it practically came to serve. Here is a case in which a rule has altogether changed its working, not through any formal enactments, but through a change in the general state of things. A right first claimed for one end came to answer an exactly opposite end; it was ordained to meet a real danger, and, when that danger ceased to be, it was found to be itself the cause of equal danger the other way. The privilege which had once secured Parliament against arbitrary interference on the part of the Crown came to lay it open to corruption on the part of the Crown. Now it serves no constant or regular end, it is at most a weapon which commonly lies idle, but which it may possibly be wise to keep in the store-house, in case some unexpected accident should again call for its use.

In the like sort the law which vacates a member's seat on his acceptance of office is one which can be defended now only on grounds quite different from those which led to its original enactment. The grounds which led to its original enactment imply that the government of the country is personally in the hands of the King, that he has the free choice of his Ministers, that he has the means of influencing and corrupting the representatives of the nation. The only grounds upon which it can be defended now imply that the government has ceased to be personally in the hands of the King, that it has passed into the hands of Ministers whom the House of Commons may be said, in a rough kind of way, to choose, and to whose appointment it is thought desirable that the people should, in a still rougher kind of way, give their approval. The principle on which the rule was laid down was a modification of an earlier principle by which it had been attempted to enact that no Minister of the Crown should have a seat in the House of Commons. The only principle on which the rule can be defended now implies the opposite doctrine; it implies that some at least of the Ministers of the Crown cannot properly discharge their duties unless they have seats in the House of Commons. The old evil was the multitude of placemen by whom the House was crowded, and whose presence destroyed its independence. A dependent constituency might be driven to elect a placeman; an independent constituency might see the member whom it had freely chosen corrupted by the acceptance of a place after his election. These two sources of corruption went on, in different forms, throughout the Tudor and Stuart reigns. The remedy proposed in William the Third's reign was absolutely to forbid all persons who held any office, great or small, from sitting in the House of Commons. The Bill indeed never became law, and those who supported it took care of their own interests by confining it to members elected after a given day. But it proposed one way of getting rid of the evil—a way which in some times and places would have been the obvious and natural one. If no member of the House of Commons could hold any office under the Crown, the Crown was clearly cut off from one great means of influence over Parliament. The point is that those who brought in such a measure as this looked on the presence of the Ministers of the Crown in the House of Commons simply as a sign of the influence of the Crown over the House of Commons. It did not come into their heads that there ever could be a state of things in which the presence of the Ministers of the Crown would be a sign of the influence of the House of Commons over

the Crown. A proposal to shut out all officers of the Crown from the House of Commons implies that the Executive and Legislative branches of the Government are two things which are quite distinct, and possibly hostile. The Minister is the servant of the King, appointed by the King, doing the King's orders, and responsible to the King only, except so far as he may be touched by impeachment or other strictly legal process. The presence of such men in the House of Commons, men who have nothing to do but to obey their own master, and who are in no way bound to shape their conduct according to the pleasure of the House, clearly undermines the independence of the House. The House contained a number of members who simply voted as the King bade them. A Bill to exclude such men, a Bill to shut out such men from the House, was in some times and places the best means of meeting the evil. Such a Bill would, in the days of Henry the Eighth, have been a wise and admirable measure, so wise and admirable that it would not have had the least chance of getting passed. And it should be noticed that this shutting out of the officers of the Executive from the Legislative body is actually the law of the commonwealth of the United States. Unlike as that commonwealth is in other things to the despotism of the Tudors, it is like it in this, that the Executive and the Legislative branches of the Government are quite distinct. Congress does not choose the President, nor can it remove him. The President therefore is really a four years' King, with Ministers of his own choosing, or at least not of the choosing of Congress; responsible only to himself, or at least not responsible to Congress. Such Ministers are very naturally shut out from Congress, and the question of their exclusion is simply part of the greater question, whether the whole relation between the Legislative and the Executive powers in the American Congress is a wholesome one. In Switzerland, where the two branches are so much more closely connected, where the powers of the Executive are so much smaller and where the Executive is chosen by the Legislature, the difficulty is got over by allowing the members of the Federal Council to be present and speak in either House of the Assembly, but without the right of voting. Thus the Executive cannot command a single vote in the Legislature, while the Assembly has the advantage of constantly hearing what we should call ministerial explanations on any point that may arise, while the American Congress puts nothing except set and solemn messages from the President.

We have said that a complete shutting out of the Ministers from the House of Commons would have been the right remedy for the evil in the time of Henry the Eighth. But it was no longer the right remedy in the time of William the Third. Though the Constitution had not then reached its fully developed modern conventional form, it had come far too near to it for the complete shutting out of the Ministers of the Crown to be any longer the right thing. Things were then in a transitional state, when the old remedies would no longer meet the old evils. The more the influence of the House of Commons grew, the less desirable or possible was it to keep the Ministers of the Crown altogether out of the House of Commons. They were fast becoming, not only the Ministers of the Crown, but the Ministers of the House, and thereby the Ministers of the nation. As soon as it was understood—as soon as there was even any approach to understanding—that the Crown could only name such Ministers as the House of Commons approved of, it followed that their presence in the House might be quite as much a sign of the influence of the House over the Crown as of the influence of the Crown over the House. It had once been desirable to shut out the Ministers of the Crown, because the House had no control over their acts. As soon as the House began to have a control over their acts—that kind of control, we mean, which is exercised without any appeal to the law, and of which a vote of censure is the strongest form—it became desirable to have the Ministers in the House, that the House might be able to hear the explanations of their policy, to question, to approve, to censure, practically to dismiss. But it was plain that this applied only to the chief officers of the Crown, to those whom we commonly speak of as the "Ministers" or the "Government." The control of Parliament over the Executive was made really more perfect by having them in Parliament, but its control would have been less perfect if they were allowed to bring in a crowd of their subordinates with them. We thus gradually reach the modern rule by which it is understood that each department of the State must be represented in each House of Parliament by one or more of its leading members, while the crowd of subordinate functionaries are shut out. By this means the Legislature is able at once to preserve its independence and to keep up its proper connexion with, and its proper control over, the Executive power.

This brings us to our immediate subject, the avoidance of seats on acceptance of office. This, as every one knows by this time, dates from the reign of Anne. But we may be pretty certain that the rule was first laid down with a somewhat different object to that which it answers now. In the reign of Anne the old feeling about the influence of the Crown had not wholly passed away, nor had the facts on which it was grounded wholly passed away either. The member who accepted office forfeited his seat, but his constituents might re-elect him if they chose. That is to say, if his constituents objected to being represented by a Minister of the Crown, and preferred to be represented by a member who was wholly independent, they might reject the placeman, and make another choice. In this we can still see the feeling that a member holding office

was less independent than a member not holding office. He had another master besides his constituents, and his constituents were therefore given the option of rejecting one who could serve them only with a divided allegiance. That right they still keep, but the reason on which it is now commonly defended is a somewhat different one. It is held that the constituencies ought to have the power of judging of the conduct of their representatives in taking office, not for the old reason that by taking office they come under the influence of the Crown, but in order that something like a national approval or disapproval may be given to the Ministry which comes into power. If the chief members of such a Ministry fail to obtain re-election, the nation has pronounced against them, and they are still more incapable of carrying on the Government than if the House of Commons had pronounced against them. The reason for re-election, in short, is no longer any dread of the encroachments of the Executive, but a feeling that the nation itself should have a share in determining who should form the Executive. And with this is perhaps connected the last change of all—that by which re-election is no longer needed on a mere exchange of office. This change is closely connected with the notion, which is now fully received, but which in Queen Anne's time was only beginning to be understood, of the "Ministry" or "Government" forming a closely connected whole. In former times the question was as to the independence of each particular man who took office. Now the question is as to the general policy of the "Ministry" or "Government" as a body. It may be argued that the nation has given its sanction to a particular Government by re-electing its members on their first appointment. When the next general election comes, it will again have the opportunity of pronouncing yet more distinctly for or against them as a body. But it may be held that a mere change of office by a member of a Government which has been approved as a whole does not involve any question of principle, and need not be followed by an appeal to his constituents. From this point of view, exchange of office and accumulation of office would be the same. How far they are the same as far as the letter of the law is concerned is another matter.

One point still remains, a small technicality which may not strike at first sight. The necessity of re-election is confined to those offices which are in the direct gift of the Crown. There are some subordinate, but still very important, offices, whose holders constitutional custom requires to have seats in Parliament, but the acceptance of which does not involve re-election, because their holders are not appointed directly by the Crown, but by the heads of their departments. Now these are just the offices for which, according to the old notion of things, re-election is most needed. Their holders are not independent. They have neither the independence of the private member nor the power of the Cabinet Minister. A constituency may like to be represented by a private member who can vote exactly as he pleases. Or it may like to be represented by a Cabinet Minister, who must vote with his colleagues as long as he remains in office with them, but who, on the other hand, has a voice in determining what measures shall be voted about. But it is quite possible that a constituency may not like to be represented by a member who has neither of these advantages, but who, as long as he remains in office, must vote for measures about which he is not consulted. According to the older notion, the necessity for re-election would be much more plain in the case of these subordinate Ministers than in the case of the chiefs of the Government. Yet, by reason of a simple technicality in the form of their appointment, there is the case in which the appeal to the constituency is not made.

After all, the argument from the existing relations between Parliament and the real Executive—that is, the Ministry or Government—might be made to cut two ways. It would be quite possible to argue that there is no need for vacating the seat in any case. It might be argued that any constituency which elects a member of the class likely to hold high office, say a constituency which elects Mr. Gladstone or Mr. Disraeli, must know that it is electing one who is likely to be called to a place in the Government, and it may be argued that, by electing him, it shows that it wishes him to become a Minister if he has a chance. In this way the reason which now justifies the need of re-election, the argument that the nation in the form of the constituencies ought to have a voice in determining who shall hold the powers of government, might be turned about to prove that the vacancy and the re-election are needless.

PLEASURES OF AN AUTUMN IN SPAIN.

YEAR after year the romance of travel is removed further and further from the reach of the tourist, as civilization extends its humanizing influences beyond what we have been wont to consider its recognized frontiers. It was but the other day that the boundless prairies of the West were brought within easy reach of Euston Station. Rail to Liverpool, steamer over the Atlantic, rail again to St. Louis on the Mississippi, and then a hundred miles or so of riding carried you into the country of the buffalo, and offered you every reasonable chance of having your hair lifted by the red man. That is altogether a thing of the past. The buffaloes are fled from the whistle of the locomotive, and the Indians are gone after them. You travel in Pullman's patent cars past the notorious Smoky Fork, the Death Bluff, and the Bloody Ford; and you must penetrate into the remote recesses of the Nevada if you are even to have a risk from miserable diggers. This is only a specimen

of the revolution that is being wrought everywhere. Russia's pacifying process in the Caucasus has made the skirts of Ararat almost as safe as the valleys that lie round Mont Blanc. No future Vambéry need visit the Tartar Khanates in a perilous masquerade, and Baker Pacha believes he has moved the borders of Egypt within easy sail of the spot where Her Majesty's Consul for Southern Africa has established amicable relations with the savages. No doubt there are still localities like Mongolia and Chinese Tartary where you must find your way through hordes of warlike barbarians, riding along precarious gangways of plank pegged to the precipices that hang over bottomless abysses. But then there are not many men who could spare the time for such an expedition as Mr. Ney Elias has successfully undertaken, even if they could manage to muster the extraordinary resolution necessary. Most people desire to compress their autumn excitement into an ordinary holiday-time, and hurry home again to resume their ordinary avocations of business or pleasure.

To such people we would say, go to Spain. The Peninsula always has plenty to interest; but this season it offers extraordinary temptations to the curious and adventurous tourist. No matter what way his tastes may tend, he can scarcely fail to find something to gratify them, whether he be interested in military operations, regular and irregular, or care to follow the deliberations of the Cortes over those causeless constitutional projects which the Ministry so carefully matures; or to watch the working of mob rule in the various revolutionary Communes, or the conflict of capital and labour as carried on with murder and fire-raising in the great commercial cities. He will be thrown into the closest contact with those bolder and more picturesque types of society with which Spain abounds, but which used to be kept in the background when the law was stronger, or when autocrats like Narvaez governed society with the musket. It will be the great charm of his journey that he will be able to count upon absolute safety nowhere. People say that, though there is a good deal of disturbance in Spain, the greater part of the country remains peaceable and indifferent. It possibly may be true. But the worst of it is—or the best of it, as you choose to regard it—that you have no guarantee for the permanence of peace in any particular spot, for the whole land is volcanic, and now Communes break out like new craters in the most unlikely spots. You go to bed one night at the *Parador de las Diligencias* in the dull old market-place of some grim old city. There is the usual swarm of draped conspirators under your windows, with the folds of the *capa* cast over their mouths, although the thermometer at midnight would mark something like 100°. You never doubt that they are discussing as usual the price of pork and garbanzos over their home-grown tobacco, and perhaps they are. But you wake next morning to find the town in full revolution. A revolutionary Junta is sitting in the town-hall opposite, presided over by your fellow-passenger in the banquet of yesterday's diligence. Bill-stickers are affixing the Junta's first and latest edict to the gates of the great church, and a couple of its functionaries are on duty at the gates of the *Parador*, because your fellow-passenger has a bedroom there, or the corporal commanding-in-chief is having his chocolate downstairs. Probably, in the dignity of their new-born authority, and in their anxiety to avoid complications with foreign Powers, the Junta may courteously kiss the hands of your worship and permit your worship to slip through their own. But then again they may not; and there is always a chance of some subordinate levying a forced benevolence on his own account, and confiscating your bullion to his pressing personal necessities.

So, whatever pessimists may say, you may be pretty certain that you will have no assurance of safety anywhere when once you have crossed the Bridge of the Bidasoa. Even if you pass straight through to Cadiz, you are likely to meet with more adventures than the Knight of La Mancha ever dreamed of, for the police of the Holy Brotherhood kept the Peninsula tolerably tranquil in Don Quixote's days. But if you desire to make the most of your opportunities, you will take one of those circular tours which the enterpriser of Mr. Cook has made so popular. You enter, as we have seen, by San Sebastian, touch Carthage on the extreme South, and come back, if you can, by Internationalist Barcelona. The beauty of it is, that, barring the risks inseparable from the free fight that is going on over the length and the breadth of the land, there is little interruption to the travelling. Had Mr. Cook himself bargained with the Spaniards to throw their country into anarchy for the diversion and instruction of his clients, the arrangements for visiting the battle-field could scarcely be more perfect. When you pass the Bidasoa, you learn that the Carlists are in force on the heights to the right which saw so much hard fighting when Soult was being pushed backwards by Wellington. That picturesque-looking old city by the river mouth is Fuenterrabia, where fifteen hundred Carlists assisted at a disembarkation of arms only the other day. You learn that Carlist pickets had been patrolling your road the very evening before your arrival, although these are Republican bayonets that you distinguish glancing in the sun on the slopes in front of you. For that long street which continues the straight road you are driving along is Irun, and Irun is occupied by five hundred civil guards, a company of regulars, and some custom-house officers. The train moves quietly onwards, although for obvious reasons a little more slowly than usual. Yet, for all you know, the opposing parties may come in collision just as you cross the ground between them; and when you have been looking forward to breakfast at the station, you may find that you have come up in time to be present at an assault in force on the town. The train moves somewhat more slowly

than usual, because accidents will occur even on comparatively level roads when rails are lifted. But when you mount into the wild mountain passes in the province of Vittoria, you become perceptibly more sensitive to that particular form of danger. The curves are so sharp and the gradients so steep that the strongest breaks could hardly save you if they happened to be applied a moment too late. Yet here, in the face of such very probable perils, the train dashes along at a somewhat reckless pace for a mountain line. If you ask the armed conductor the reason, he points out that of two evils it is wise to choose the less. Nothing is more likely than that you may go flying over some precipice at a corner, instead of running round the curve, except, indeed, the probability of the Carlists firing a volley into the windows by way of practical joke, were you to slacken pace sufficiently to tempt them. For the time being they are invisible, like Old Alpine warriors before they started into sight at their chieftain's signal whistle; but doubtless the copsewood is quite full of them. It is true the railway directors have contracted with the Carlist leaders that the trains shall go free for a certain blackmail; but subordinates are apt to override such arrangements when they have not been invited to share in the subsidy.

Suppose you emerge from the Carlist country with your person safe, and without having been executed as a Republican spy, or put to ransom for the benefit of the Royal Exchequer. Suppose you escape those independent outlying bands which infest the Guadarrama and the environs of the Escorial. You find yourself in the capital enjoying a new phase of excitement. Here there is no fighting or civil disturbance. It is merely a question of amicably arranging the new constitution of the Federal Republic. It is all to be settled within the walls of the Cortes in Parliamentary debate. You obtain a ticket for the gallery, and, having occasionally assisted at the deliberations of the Versailles Assembly, are not much scandalized by the vigour and fervour of these Southern orators. A burning matter of detail is being debated, and you explain the violent and tedious personalities of the irreconcilables by the certainty of their having to succumb on a division to an overwhelming majority. Soon you surmise that it was not altogether without an object that they have been talking against time. Something like a dull roar is coming through the open windows, and you see faces on the Ministerial bench turning from red to pale in spite of the heat. The debate is hastily adjourned without the objectionable resolution being passed, and when you have made your way out of the door, you are landed in the middle of the Madrid mob. You may have seen the many-headed in the bull ring before, and thought it one of the very ugliest monsters you had ever set eyes upon. You like its looks much less now, when it has been largely recruited from those desperate ragamuffins who cannot even command a peseta for the bulls, but who can all afford the long Albacete knives which they wear conspicuously in their ragged sashes. Nor is it altogether reassuring, if you care for your life more than for Señor Salmeron and his Constitutions, that the windows of the great Medina Celi palace opposite should be filled with civic guards and their rifles. It would be so safe in the meantime for those amateur soldiers to pour a volley down among the knives and rusty muskets; and the decent dress which marks you an aristocrat and a foreigner is already causing you very serious anxiety, although the mob as yet has not been lashed into fury. You have, in fact, arrived in Madrid during a Spanish Ministerial crisis, and, as a stranger and a neutral, the situation becomes rather tense for your nerves when you can never take the shortest walk abroad without passing between the hostile positions of excited politicians of the most advanced opinions.

Proceeding southwards, your speculations take a somewhat anxious turn as you approach the railway junction in the Sierra Morena. It is not that you are doubtful about "establishing connexions," but because it is the celebrated Peco who superintends the arrangements of the line, and Peco is a brigand of the good old school, although he can show his colonel's commission from both the Carlists and the Republicans. If you reach Cordova without having been interviewed by Peco, you glide along the banks of the tawny Guadalquivir to Seville; and, had your luck been better, you might have seen the Communists executing their masterly retreat, leaving the city in flames behind them. Shells from an insurgent cruiser are falling fast into fair Cadiz. You cannot carry out your intention of riding from Gibraltar to Malaga by Ronda, because the Internationalists are established in force in the Sierra, and none of the horse-hirers of the Rock will trust his animals in the clutches of these men and brethren. So you take a berth in a coasting steamer. It dares not touch at Malaga, because a bombardment is going on; you can hear the shots as you hold out to sea; and at Almeria you see the visible signs of a bombardment which took place before your visit. Off Carthage you are chased by one of the ironclads of the Murcian navy, and you only escape being made prize of war because the landsman in command of her cannot sail his ship. Alicante, the port of the capital, is quiet, because it is filled with vessels of war, and all bristling with bayonets; and Valencia, because the Communists have had their will of it already, and left it in comparative solitude. But you find Barcelona in full insurrection; the Commune is proclaimed at last by its thousands of Internationalist workmen; the fort of Montjuich is firing on the town, and the Carlists are occupying the suburbs that have sprung up round the villas of the manufacturing princes. It is out of the question landing there; nor, if you did, would it help you out of the country, which by this time you begin to have had quite enough of. All travelling is stopped on the great

line of communication with France, and the Carlists are threatening all the Northern fortresses.

With the exception of the outbreak in Barcelona which is always imminent, and the bombardment of Malaga which was merely avoided by an accident, we have combined these experiences of our imaginary tourist entirely from the telegrams of the last few months, and who shall say that the future does not promise as much sensation as the past? We have avoided Salamanca and Granada, and many other places of interest; but even his flying trip by the chief cities and the main lines must have provided excitement enough to satisfy any reasonable man.

BISHOP REINKENS'S PASTORAL.

WHEN we spoke last week of Bishop Reinkens's consecration, we stated that he had issued a Pastoral, but that the text was not yet before us! And we might have added that the telegraphic summary, which represented it as a homily on the duty of passive obedience to the State as comprising the whole duty of man, or at least of an Old Catholic, did not strike us as very likely to be correct. That suspicion is now abundantly confirmed by the appearance of the document itself in the German newspapers, though it is no doubt open to the intelligent criticism of the *Times*' Correspondent, who dismisses it with the contemptuous remark that "the Bishop is silent upon the nature of sin, the efficacy of prayer, and the immortality of the soul." We believe the Lord Chancellor's Judicature Act is equally "silent" on the rights of man. But Dr. Reinkens might fairly plead that a pastoral is not a treatise on the first principles of natural and revealed religion, however "all-engrossing" such subjects may be, and that a Christian bishop must be presumed to believe what nineteenth-century Christians of every communion regard as elementary truths, unless he expressly asserts his disbelief. His manifesto is, in fact, an extremely able and comprehensive statement, defining with much force and clearness the position of the Old Catholic body, and their conception of the true office of the episcopate. But, before giving an account of the document, it may be as well to say a word of the writer and of the present religious situation in Prussia as it affects his prospects.

Our readers are already acquainted with the recent decision of the Supreme Court of Appeal at Berlin, which recognizes the full rights of the Old Catholic clergy and laity as belonging equally with their Ultramontane adversaries—and indeed by a better title—to the Catholic Church. Dr. Reinkens and the priests he ordains must therefore be acknowledged as a Catholic bishop and Catholic priests in the eye of the law, just as much as Bishop Ketteler or Archbishop Ledochowski and their priests. And what makes this all the more important is that the Prussian Government is just now engaged in an interminable struggle with the diocesan bishops, who one and all refuse to submit their seminaries or their appointments to benefices to civil inspection, according to the new laws; while all priests trained in colleges not sanctioned by the State, or appointed without its sanction to any cure of souls, are henceforth to be treated as intruders, and their acts—e.g. of marriage or baptismal registration—as having no civil validity. It may be as well, however, to add that the Ultramontane *camard* about their priests being forced to serve in the army, which the *Times* went out of its way to repeat the other day, long after it had been contradicted, never had any foundation, except that the law of conscription will henceforth apply to theological students in unlicensed seminaries. Still it is a very pretty quarrel, and both parties look resolute and uncompromising enough; in fact, both have gone too far now to recede without sacrifice of dignity, if not of self-respect. Under these circumstances it is obvious that the existence of an Old Catholic episcopate and priesthood—whose orders, be it remembered, even Rome cannot venture to impugn—may have a very important bearing on the future progress of the conflict. And, although Bishop Reinkens, who is naturally careful to keep quite within the mark, only lays claim as yet to "more than fifty thousand German Catholics" who acknowledge his jurisdiction, the number is continually increasing, and is likely to increase more steadily now that the movement is better organized. Moreover, as we have before observed, the influential and significant Silesian address to the Emperor would alone prove that there is a very large reserve force of anti-Ultramontane sentiment among the educated members of the Church who have not openly joined the anti-infallibilist party. There is nothing in the character or antecedents of Dr. Reinkens to prevent his winning the confidence of moderate men who are Catholics without being "Romanists," in the sense attached to that word in Germany. He is 52 years old, and was ordained priest in 1848 at Cologne, having previously distinguished himself at the University of Bonn. In 1849 he received a doctor's degree at Munich, and in 1850 commenced teaching as a *Privat-Dozent* at Breslau, where he has twice been Dean of the Theological Faculty, and once Rector of the University, and where for five years he held the office of First Preacher in the Cathedral. During 1867 and 1868 he resided in Rome, and thus had an opportunity of examining on the spot the present condition and policy of the Roman Church, his unfavourable estimate of which was confirmed by the conduct and results of the Vatican Council. His first work was a prize essay on the "Idea and Definition of Virtue among the Greeks"; and he published three years ago his *Aristotle upon Art*, for which he received an honorary doctor's degree from the University of Leipzig. His other publications

are chiefly on theology or ecclesiastical history, and include works on St. Clement of Alexandria, St. Hilary of Poitiers, St. Martin of Tours, and the *History of St. Augustine's Philosophy*. And he has the advantage, not perhaps very common among German Professors, of being a fervid and eloquent preacher, as well as a man of deep learning and thought. The Old Catholics, to all appearance, could hardly have made a more judicious selection of their first bishop.

The opening words of the Pastoral are calculated, and probably designed, to dispel any lingering doubts or misrepresentations as to the religious standpoint assumed by the newly consecrated Bishop for himself and his flock:—"Joseph Hubert Reinkens, Catholic Bishop, to the Catholic priests and laity of the German Empire who persevere in the ancient Catholic faith, greeting in the Lord." He then says that the delegates of more than fifty thousand of these Catholics, with their faithful priests, have chosen him bishop, by a method of election unusual now, though it is in reality the ancient, apostolic, and truly ecclesiastical method, and is not a novelty, but a return to the original and legitimate practice. He cites St. Bernard's authority to show that an election of bishops by the clergy and people was still in the twelfth century regarded as the sole legitimate and apostolic method of procedure, though it had already been disturbed and interrupted. As the episcopal office became more and more transformed into a place of worldly dignity and emolument, and an object of ambition, often of purchase, to the younger sons of noble families, the clergy and people were by degrees robbed of their rights, which were usurped under various pretexts by the Pope and the civil potentates, and the Pope began to call himself exclusively the Vicar of God, whereas all bishops had formerly shared that title. And thus we have been at last brought, after long contests, and to the deep injury of the Christian religion, to the present state of things, when Catholic princes nominate bishops in their dominions, and the Pope confirms them, while in non-Catholic countries the Chapters nominally appoint, but the Pope in the last instance, and in heathen countries, or countries treated as such, the Pope directly and alone. The conduct of the bishops, who act as mere creatures of "their master" the Pope, and have abetted him in overthrowing the divine order of the Church, and distorting the faith by additions made in defiance of Scripture and tradition, has compelled those who are loyal to the ancient faith to act for themselves, and fall back on the old apostolic system. Dr. Reinkens has been called to an office which he had earnestly sought to decline, but which is now his by virtue of legitimate election and consecration. He has not been named by the Pope, nor sought his confirmation, nor taken any oath of allegiance to him. In strict canon law, indeed, the Papal See must be regarded as vacant, for a Pope who obstinately persists in error is *ipso facto* deposed. And the two decrees of July 18, 1870, which attribute to the Pope universal ordinary jurisdiction and a final infallibility in faith and morals independent of the Church (*irreformabilem ex sese non autem ex consensu Ecclesie*), are an outrage on her authority, and would annihilate her apostolic constitution. Christ bids us hear the Church, but Pius IX. bids the Church hear him. To such a Pope no oath of allegiance can be taken, neither is there any necessity for it. Such oaths have never been required of Oriental bishops, and were only introduced in the West in the later middle ages, and the present form of oath is an usurpation and a sin against the Church. Bishops have now to swear obedience to the Pope as their master and absolute sovereign, whose prerogatives they will maintain and extend to the utmost of their power, while there is no word of their duties to their people or their responsibility before God. It is not Papal nomination or confirmation, but consecration by a bishop who can trace his succession from the Apostles, that makes a legitimate bishop, according to the teaching and practice of the ancient Church for above a thousand years. And this consecration he (Dr. Reinkens) has received at the hands of Mgr. Heykamp, a bishop of the ancient and rightful Church of Holland, which the Court of Rome and the Jesuits have iniquitously persecuted. "I therefore undertake the office by virtue of legitimate election and apostolic succession, and in order to help those Catholics, loyal to their faith, who, without any fault of their own, are involved in so terrible an oppression of conscience." For Christianity has become even more degenerate than Judaism at the time of Christ, when ceremonial was corrupted with heathen admixture, and men were taught to divert their religious reverence from God Himself to the priesthood who usurped his place. In demanding and promoting this worship of their office the chief pastors feed themselves instead of their flock. This worship of office (*Würdencult*) is as heathenish as the miracle-mongering through a senseless image-worship. "Instead of the Word of God, the pulpits resound with controversy; instead of Christ, the Pope is preached; instead of grace and truth, miraculous legends; hatred instead of brotherly love, and cursing instead of blessing." Nothing may be read or listened to which the Roman bishops forbid, without mortal sin. The upshot is, "Prove nothing." Thus the need is now at its sorest, but also God is nearest.

The Bishop proceeds to inquire what are the duties of his office. Not certainly to assume the pomp of an ecclesiastical court, which bishops borrowed from the old Roman Empire, or to receive divine homage and titles; above all, not to dominate. It is an error to suppose that bishops are to represent the divine attributes on earth by a standing personal miracle; their office is not a personal privilege, but the service of the faithful. What then, asks Dr. Reinkens, is my duty? To proclaim what God has revealed to little

ones; to preach from the housetops what He revealed in secret to His disciples. That is a message of which nothing is "inopportune," nothing for a privileged caste, but all for every one, and at all times. It is not a penal code, still less a sentence of condemnation or an anathema, that has been nailed to the Cross—but the Gospel, the good tidings, the truth which makes men free, the light which shines in freedom. It is a bishop's office to be the steward and dispenser of the mysteries of God. And his first duty is to be faithful, above all to God, who has made him His steward, but not His substitute, and who alone possesses those treasures of grace which He has committed to His Church to use and dispense. A bishop must preach the religion of Christ and stir up in men's hearts the love of God and of our neighbour, without which all outward show of religion is vain. And, lastly, a bishop must support and promote in the consciences of men loyalty towards the civil order, which is of God. Honour to kings, reverence for law, love of fatherland, are not ethical virtues outside Christianity and the Church, but Christian virtues, for which view various passages of the New Testament are quoted:—"It is not the domain of faith but of law which belongs to Caesar; but he possesses that by the immediate ordinance of God." A bishop, therefore, must exhort men to obey the secular power for the Lord's sake, and he betrays his office if he preaches disobedience. The Pastoral concludes as follows:—

Two mighty enemies are opposed to the fulfilment of my office, ecclesiastical materialism and indifference—both produced and fostered by the corrupting Romanism in the Western Church. The first merges religion in sensual excitement and the mechanism of Church government and ritual; it ties down the divine to accidents of place and person, which it makes the objects of worship, and leads on the inextinguishable superstition and thence for the marvellous of a people who have been continually kept in ignorance of Scripture and Tradition. In this there is no religious life, and the spirit is fled. . . . But the number of the indifferent is legion, who in the din of the world's market have grown deaf to the heavenly revelations of the glory of God and the music of the Gospel message of eternal peace and love. These men our opponents count as material ready to their hand. And then besides these, on our right and left are arrayed the half-hearted, some of whom cry, "You go perhaps too far for us," and others, "You perhaps don't go far enough." To them I answer, "We will go as far as the Spirit of Christ will lead us, and no further. If you believe that you are more entirely under the control of that Spirit, come and help or guide us: to stand all day idle, while the vineyard of the Lord is being worked and there is a cry for more labourers, is anyhow sinful." Yet we acknowledge with thankfulness to God that many who had been repelled by the materialistic Romanism in religion are now returned with joy to Church life, since it has been offered them in a worthy and really religious form. But it behoves us above all, beloved in the Lord, who by God's grace we clearly, to bring our hearts into entire subjection to the kingdom of God, which is truth and righteousness, that, as the spirit manifests His life in us, we may exhibit a true renewal of Christianity in its original light and winning loveliness before the face of the nations. And then will the elevating hope which inspires us grow stronger day by day, of seeing all the abuses at length healed which have led to the building up of a spiritual despotism in the Church. The schism between the Eastern and Western Church, and within the bosom of the latter, is a great evil. Not unity, but manifold division, has the Roman dominion produced, because it detested love and set naked authority in its place. We strive to regain unity, but in conflict, and on our banner is inscribed on one side, "No other foundation can be laid than that which is laid, Jesus Christ"; and on the other, "Whatever is not of faith is sin."

SERGEANT COX ON "BUTTONS."

THE newspapers have been treating their readers to long and unsavoury reports of a case of alleged fraud, which would probably have been disposed of in a few lines but for the nastiness supposed to be mixed up with it. A page, fourteen years old, was accused by his mistress—described as a "lady of fortune and social position"—of having defrauded her of some three hundred pounds by falsely representing that he was suffering from a painful disorder and required medical treatment. It was admitted that there was really nothing the matter with the lad, but it was alleged in his defence that the lady knew this, and that the imaginary payments to the doctors were only a cover for bribes of a particularly disgraceful kind. The jury were unable to agree upon a verdict, and the case will therefore be tried again. Upon the question at issue we have of course nothing to say. The lady appears to be one of those weak, impulsive persons who are capable of almost any amount of imbecile folly, and who painfully illustrate the saying that there is no fool like an old fool. Whatever may have been the original character of the page or the relations between him and his mistress, there can be no doubt what he is now. A wretched little puppy of fourteen, who spends his evenings at music-halls, intrigues with shop-girls, and imitates all the fashions of mature debauchery, is indeed a pitiable product of modern civilization. The poetry of Cherebin is lost in the gross disorders of this diminutive Don Juan. Apart altogether from the particular issue submitted to the jury, it is impossible to acquit Miss Warren of having contributed to corrupt and demoralize the boy by the outrageous way in which she petted and indulged him. No child of that age could resist the baneful influences of such a scandalous degree of freedom and dangerous command of money. His mother and a sister, who were also for a time in Miss Warren's service, assert that he ruled the whole household. "He used to order us about, go in and out when he liked, wear evening dress, with white waistcoat and roses in his button-hole; in fact, he was quite the gentleman." His brother, who was coachman, said the boy would often spend 5*l.* in a day. It is impossible to imagine anything more ruinous for a lad than such treatment as this. It is true that spoiling a child in this manner is not a criminal offence, but Miss Warren has certainly laid herself open to the strongest

censure. The old idea of a parental relationship between the master or mistress of a household and the servants is happily not yet altogether exploded; and the tender years of the boy in this case made it still more necessary that he should be sharply watched and subjected to strict discipline. Walter Howard could never have become such a precocious and disgusting little *roué* if his mistress had not failed egregiously in her duty towards him, and the painful and humiliating exposure which she has suffered is a very slight punishment for the evil she has done.

However, what now concerns us is not the case itself, on which, as we have already said, we express no opinion, but the remarkable dissertation on the whole duty of pages and the natural relations between them and their mistresses which is to be found in the summing-up of that learned judge, Sergeant Cox. The Sergeant appears to be disposed to take what we may call a broad view of the subject. "If," he told the jury, "they know anything of the habits of persons of the rank of life in which pages were kept," they would probably know what was the position of a page. We are not aware how far the sort of people who fill the jury-box at the Middlesex Sessions can be expected to know anything of the habits of persons who keep pages, but no doubt they were quite ready to believe anything the judge chose to tell them. Mr. Sergeant Cox, from the ease and confidence with which he dealt with the subject, is evidently under the impression that at least he is himself thoroughly acquainted with the habits of this "rank of life." It would perhaps be more correct to say that there are several ranks of life in which pages are to be found, and that there are a great many different kinds of pages. But we presume the judge was speaking of some rank of life with which he is himself personally acquainted, and the account he gives of the ways of this society is certainly rather startling. Mr. Sergeant Cox starts with the proposition that a page occupies quite a different position from that of ordinary servants. He is "appointed specially to wait on his mistress," and "to do all kinds of things." "He is admitted to all kinds of privileges, and to places where no grown man would be allowed." We rather that the peculiar position of a page is due partly to his extreme youth, and partly to his being specially attached to the lady; but we are hardly prepared for the length to which Mr. Sergeant Cox carries the principle of freedom and familiarity of intercourse between "buttons" and his mistress. There would, he assured the jury, "be nothing wrong in allowing a page to go even into his mistress's bedroom." We should rather have expected that this statement, which is somewhat sweeping as it stands, would have been qualified by the addition of "under certain circumstances." It is obvious—at least we should think it must be obvious to any one except the learned Sergeant—that this is a case in which a good deal might depend on circumstances—as, for instance, the time of day; and that what might be natural at one hour might be thought a little strange at another. The Sergeant's notion seems to be that a page is a sort of body servant, who is in and out of his mistress's room at all hours. We cannot say what he may have observed in his own "rank of life," but he may possibly learn on inquiry that in other spheres it is not usual for ladies who keep pages to dispense with the personal attendance of their own sex in their more private hours, and that "buttons" is not exactly a substitute for a waiting-maid. Having settled this point, Mr. Sergeant Cox (if he is correctly reported) pushed his argument a step further. "No familiarity," he declared, "with a child of eleven and a half years would reflect the slightest discredit on an elderly woman; not even if she kissed him every day, and even put him to bed." We may remark in passing that, although Walter Howard was eleven and a half when he entered Miss Warren's service, he is now fourteen; but the judge's observation would seem to be meant to apply equally to the more advanced age—at least we are led to suppose so from the absence of any hint to the contrary. When a Middlesex Sessions judge is explaining the mysteries of high life to a Clerkenwell jury he can hardly be too precise in his statements, and it is a pity that Mr. Sergeant Cox did not lay down the age at which, in his opinion, elderly spinsters who are in the habit of kissing their pages and putting them to bed had better draw the line. If there is no difference between fourteen and eleven and a half, is there any difference between fourteen and sixteen, or may the kissing and cuddling go on till the boy comes of age? As far as we can make out, the learned judge seems disposed to draw the line according to size rather than age. He was at considerable pains to impress upon the jury that the boy in this case was "a very little boy" for his age. If he had been the least thing bigger it might perhaps have made a difference. It would be interesting to know the exact point of stature which marks the distinction between innocent and compromising familiarities. The "only a very little one" argument has been heard before in the case of another infant, but the Sergeant is entitled to credit for the novelty of the application of it in this instance. It is unfortunate, however, that he did not favour the jury with a more precise indication of the size at which a boy in buttons becomes in his opinion too big for the purposes to which he so delicately alluded. If this had been furnished, a yard measure might perhaps have settled the question at issue.

With the Clerkenwell jury Mr. Sergeant Cox of course had it all his own way; but it may possibly surprise some persons of "the rank of life in which pages are kept" to learn on such high authority that it is usual for ladies to bestow motherly or grandmotherly attentions on the little boys who are hired to wait on them, and that there is nothing to excite remark in a lady

kissing and hugging her page, or putting him to bed. Miss Warren said that she had kissed and been kissed by young Howard, that he once addressed an indecent observation to her about her legs, and that he had also sung an indecent song in her presence. She hung up a photograph of this interesting child in her drawing-room, gave him the use of her pony, played the piano to him while he sang, called him "dear" and "darling," and kept him plentifully supplied with money. The learned Serjeant suggested that she took a grandmotherly interest in the boy, and that it was very natural she should do so. But, in the first place, we should expect to find a grandmother hoxing the ears of a boy who behaved in this disgraceful manner, instead of petting him; and, in the next place, mistresses can surely take a proper interest in a young domestic without going the length of grandmotherly fondling. The page was a curious and important figure in the social life of a former period, and those who came to study the relations which were then apt to spring up between pages and their adopted manus may satisfy their curiosity by reference to such stories as that of *Petit Jehan de Saintre*. The page of our own day had sunk, we imagined, from romance into common drudgery, and it is a pity that Mr. Serjeant Cox should have attempted to revive him as a poetical pet. On the whole, the grandmotherly attentions which he thinks so natural seem to us, and we should hope they would seem to most people, in exceedingly bad taste. To say the least, they are sickly and unwholesome, and liable to misconception. Elderly ladies who have no families to look after must, we suppose, have pets; but it is as well that they should confine themselves to the animal kingdom. Cats or parrots may be petted with impunity, but such a shameless young rip as Walter Howard is a social nuisance, and even danger.

Mr. Serjeant Cox made one rational observation in the course of his address, but we are hardly surprised that he does not seem himself to have understood it. He said it was difficult for parents to know when children ceased to be children, and that they often continued to treat them as mere children after they had passed the age of puberty. This may be natural with parents, but the case is different when we come to old ladies and their pages, and old ladies should at least be warned that they had better be careful to err on the safe side. The judge's address was no doubt framed in a spirit of amiable benevolence towards both elderly ladies and small boys in buttons. He seemed to be willing that they should be regarded as ethereal and disembodied creatures, apart from and above the censorious rules of conventional propriety. But the effect of his remarks is calculated, we fear, to produce dreadful confusion in a sphere of social life which is entitled to every consideration. Elderly ladies who do not care to have it supposed that they are in the habit of cuddling and slobbering their youthful domestics and tucking them snugly into bed may, after Mr. Serjeant Cox's startling assertions as to what is the common usage in such cases, feel bound to free themselves from suspicion by discharging the luckless lads. On the other hand, there may be old ladies who will be encouraged by the Serjeant's glowing pictures of the tender sympathies which he says prevail in high life between mistress and page to proceed to the extreme verge of grandmotherly familiarities, and they may even be led to suppose that they will be wanting in their duty unless they do so. As for the boys themselves, they will, no doubt, all expect to enjoy those privileges of their "peculiar position" on which the eminent judge descanted so warmly. As far as our own observation has gone, we cannot say that we have found that old ladies who kept pages were usually deeply enamoured of them. The tendency on their part has rather been to decry and disparage the youths as demoniacally inspired with a hopeless passion for idleness and mischief. The Serjeant's remarks will, we fear, still further embitter the relations of mistress and page.

VESTIGES OF CARACTACUS.

THE interest of the recent meeting of the Cambrian Archaeologists at Knighton turned rather on camps and entrenchments than on churches and castles. Knighton is a pleasant little town on the right bank of the Teme, on the confines of Radnor and Salop, and conveniently situated for exploring the border country on either side. On the English side Wigmore Castle arrested special attention both by its magnificent site and outlook and its great historic interest; Olun Castle claimed due notice as the original of the "Garde Doloureuse" in Scott's novel of the *Betrothed*; and Bampton Bryan was visited as the scene of Lady Brilliana Harley's famous resistance to the Royalists in the time of the Civil War. On the Welsh side, except for the faintly traceable vestiges of Abbey Owmlhir, once a Cistercian monastery and abbey of very noble dimensions, there was little to attract attention, the churches being of a rather poverty-stricken type; and across the Teme restoration had so mistaken its proper work as to limit or obscure considerably the province of the antiquary. But the number of British and Roman camps and stations in the neighbourhood, and the local sense of proprietorship in the British hero Caractacus and his gallant resistance to the Roman arms, justified a more than ordinary diligence in this department of archaeology, with a view to determine the claims of traditional sites to the honour of having furnished the brave Silurian with a last battle-field. The area covered by the excursions of the Association in the first week of August included at least three competing claimants for this distinction: the Gaer camp on the hill above Llanddewi and the valley of the Llan, Caer Caradoc, a mile

or two from Knighton, on the road to Ludlow; and Corwall Knoll, some three miles to the east, which relies for its chief title upon the fact of its nearness to the Roman station of *Travialum*. For each of these there is more or less to be urged, but we cannot say that the researches of the week succeeded in doing much towards an affirmative conclusion in favour of any one of them, although indubitably each may have been a fortress, and even a battle-ground, of the Silurian chief, whose final struggle we should be inclined to place a good deal nearer the Severn in Salop or Montgomery. The difficulty of the whole question consists in the very slender data furnished by Tacitus, who describes the scene of operations at second-hand, and in the total absence of any collateral testimony. Obviously the discussion may go on for ever, if the faintly marked lines of the Roman historian are departed from, and if local predilections assert pretensions not in accordance with his account, such as it is. A frequent rejoinder to those who suspend their belief in the claims of Caer Caradoc is that the name itself is conclusive. But unfortunately there is also a Caer Caradoc, or Camp of Caractacus, near Church Stretton, and another, called by the natives "Craddock," near Sellack, in Herefordshire. All these being in the territory of the Silures, each may have been, and probably has been, a defensive work of the hero of the struggle against Ostorius; but it is difficult to say which of them is to be identified with the scene of his last struggle.

As the whole campaign occupies only five chapters in the Twelfth Book of the Annals, and as no small part of these is irrelevant to the site question, being devoted to the arguments used by the leaders on either side to inspire courage in their soldiers, all that can be done is to get a clear general view of the geography and topography as Tacitus understood it, and as it is broadly set down by commentators and historians. If we take up Tacitus's account at the point where, having chastised the Cangri (at the extremity of Carnarvonshire), the Roman General Ostorius is recalled to repress a hostile movement of the Brigantes, who lay to the north of the Mersey, and extended from sea to sea, it appears that these were quickly quelled, but that the Silures offered a more troublesome and menacing obstacle to Roman supremacy. The Silures broadly represent the people of South Wales, with the addition, in all probability, of the counties of Hereford and Monmouth; and the Roman general's device of founding a colony at *Camulodunum* (Malden), in Essex, "as a bulwark against the rebels, and for inuring allies to the laws and jurisdiction of the Romans," seems a roundabout way of coercing the Silures. But it appears from Dion Cassius that Caractacus was the son of Canobelin, the chief of the Trinobantes, so that between the far East and far West there were ties of clanship and interdependence. Such must be the interpretation of the words "*Id quo promptius veniret—colonia Camulodunum deducitur*" (*Tac. Ann.* xii. 32); and in the fifty-first chapter of his *History of the Romans under the Empire* Dean Merivale gives ample reasons why this should have been a relevant act of repression and coercion, and not so incongruous as to justify resort to another theory—namely, of a *Camulodunum* in South Wales. When, however, this had been done, Ostorius, we read, proceeded to the direct task of crushing the Silures and their leader, who had laid waste the fields of the Roman settlers on the Severn and the Wiltshire Avon. Driving him across these, with the contingents which he would gather from his stations on the Outwolds, he may be assumed to have forced the Briton back first on his outer line of defences on the Malvern range, and then upon the inner line to the north of Herefordshire, where the undoubted British camps of Croft Ambrey and Wapley represent the southernmost fortresses of the inner series. Storming those with no small loss of men and time, he seems next to have been drawn by Caractacus, who knew the country, into the territory of the Ordovices (in other words, North Wales), the boundary line betwixt whom and the Silures Dean Merivale would place between the Wye and the Teme. Now such a boundary would not be inconsistent with the claims of the Knighton district to have given Caractacus a field for his last struggle; but, unless the other features which the historian expressly associates with it are traceable, prudence would dictate seeking further on in North Wales—in Montgomeryshire, for example—a site more exactly corresponding with the account of the Annalist. And the notes which he furnishes of the situation are simply these:—"Access, egress, everything, was in favour of the Britons, and inconvenient to the Romans." "The naturally steep ridges of mountain whereon the stand was to be made were strengthened, wherever they were of an easier ascent, by stones piled up in the fashion of a rampart." "At the base of the mountain flowed a river, which, either because of occasional floods or ignorance of its depths, was of uncertain forage (*yado incerto*)," and beyond it, on the rocks above, "stood swarms of barbarians ready to contest the vantage-ground." It follows surely that, amongst other things, we require, in the site of Caractacus's last battle, a river at its base which might test the legionary's skill as a swimmer, and that, the river passed, he should find a sheer height opposed to him, with the enemy atop of it. Furthermore, when beaten, the Britons, according to Tacitus, had easy means of retreat to their native fastnesses. "*Decedere barbari in juga montium*"; and this too by a way, as we have seen before, which was favourable and friendly to the Britons.

Of the three British encampments visited by the Cambrian archaeologists during their meeting at Knighton, two fulfil most requirements, but not one of the three quite satisfies the description of the situation by Tacitus. To take them in their order, the British camp above Llanddewi, visited on the 5th of August,

is a very strong entrenchment, with a triple ditch on the accessible side, where stood the principal entrance. From its top there is a commanding view embracing Plinlimmon and the Kerry Hills, and overlooking the Roman road and Roman station in the valley of the Ithon. Dean Merivale had already, in his history, recognized the possibility of a competing site in this place, and an ingenious theory was started by a gentleman possessing intimate knowledge of the country, that, supposing the object of the Roman general to have been to cut off the retreat of the Silures into the mountain fastnesses, he may have advanced from Wapley by the bank of the Arrow, and so into Radnorshire through the open valley of Painscastle, and along the line of what was afterwards the Roman road, now called the Portway. At Llanddewi the vale of Ithon narrows, and, to storm the Gaer camp, he would have had to cross the river immediately at its foot. As this is even now impassable, and as its fords are very uncertain in the rainy season, it would have still more merited the description of Tacitus when the valley was a swampy morass with dense underwood. The theory which we are recording proceeds on the supposition that the Silures after defeat retreated from this entrenchment on its north-eastern extremity, and made for the forests and fastnesses of Plinlimmon by way of Caer Sws; to effect which they would have no steep slope between them and the hills, whilst, if Ostorius endeavoured to advance further than Llanddewi, on the north-western side of the camp, his progress would be impeded on that side by the then impassable gorge of the Ithon. Here we have then the river, the Roman station in the neighbourhood, and the hills upon which the Silures could without difficulty retire. What chiefly stands in the way of the acceptance of this site is that it is almost certainly in the country of the Silures, whereas Caractacus's last battle was in the territory of the Ordovices. Whatever was the boundary line between these important tribes, there is no reason for supposing that it would affect the dwellers at Llanddewi and on the Ithon. That Caractacus may have occupied this strong position in the course of the campaign is quite possible; that it was one of his own strongholds, and one capable of defence by an uncivilized force against a civilized, is not improbable; but unless we decide that Tacitus was more lazy about the lines of demarcation between the British tribes than consists with his relationship to Agricola, who would be at home in the whole subject, it is hazardous to fix the last battle in the country of the Silures in South Wales instead of North. It might be added that this theory involves a greater *détour* on the part of the Romans than is consistent with a step-by-step pursuit, especially when, as Tacitus puts it, the retreating general was superior in knowledge of the country, and to a great extent determined the line which both armies would have to take. It is easier to believe that the Silurians retreated from Wapley on Caer Caradoc by the valley of Presteign and the defiles betwixt it and Knighton; or else on Coxwall Knoll in two bands, the one retreating towards Knighton, and then following the course of the Teme, the other finding its way less circuitously by the course of the Lugg.

Caer Caradoc was visited by the Cambrians on the 6th of August, and Coxwall Knoll on the day following. No one having the least acquaintance with the subject can doubt that both are British works of defence, the former being a fortress of remarkable strength and magnitude. The triple lines of entrenchment here are stiffer and steeper, as well as of greater height, than in the case of any other British camps in the neighbourhood. Its irregularly oval area extends over a larger space of ground, and its two entrances at north-east and west are conveniently placed and admirably furnished with facilities of defence. In many respects it gives the impression of a strong permanent fortress, such as might have been inhabited constantly or on emergencies for a considerable time, though there is no trace here, as at Wapley, of a spring or reservoir for the supply of water. At Coxwall Knoll there are two ponds which might have answered this purpose. But we fail to discover at Caer Caradoc the precipitous ascent which Tacitus's narrative supposes. Its character is rather, as Hartshorne has observed in his *Salopia Antiqua*, that of an elevated down. Besides this, the stream to be forded or swum across is conspicuous by its absence. The Teme at Knighton is three miles away. The Clun, its sister stream, is at a like distance. An inconsiderable rivulet, called Chapel Brook, is literally invisible from the summit, and no allowance for the lapse of ages and for changes due to cultivation and civilization can persuade us that it could ever have presented even a nominal obstacle to the Roman invader. Neither do we find here the easy access to mountain fastnesses when defence was hopeless, whilst it must be added that no Roman station is in the immediate neighbourhood. That this Caer Caradoc was a place of great strength and importance is indubitable; and it would be interesting to make excavations for traces of huts or dwellings there. But though it may possibly have answered the description of Tacitus as an Ordovician and not a Silurian fortress, it has so many notes of difference that one is constrained to give up an entrenchment worthy to have made the last standpoint of the gallant Briton. Of the pretensions of Coxwall Knoll (a wooded camp, as its name from *yagod*, "silva" and *gwel*, "vallum," seems to import) less can be said with plausibility. Its base is indeed washed by the Teme, which is here very shallow to all appearance; and it has opposite to it the Roman entrenchment at Brandon Camp, with Norton Hill at no great distance. But in its narrow oblong eminence of twenty acres, girt with double ditches and mounds following the configuration of the ground, there is no

great altitude, certainly not the commanding height which the Britons generally choose; and whereas Tacitus says of the "last battle" that its situation was favourable to the Britons, but not so to the Romans, it is plain that a position so comparatively low-lying would be easy for the Romans to scale, while its absolute insulation on all sides would render it signally unfavourable for the British retreat. Coxwall Knoll has some very notable features, particularly a sort of double camp, of which the east end, of irregular shape, is separated from the west and larger part by a fosse, or perhaps natural ravine, of great depth; but the theory originating with Aubrey, that it was the scene of the last battle, fails in so many particulars that Sir Roderick Murchison was led to suggest a commencement of the battle two miles higher up, at Holloway Rocks, and a final decision at Caer Caradoc. It seems a sorry return for the kindness of the modern Silures, who welcomed the Cambrian Association with so friendly and intelligent a spirit at Knighton, to rob them of the reputation of a supreme decision of battle in their borders; yet all that can safely be said is that their neighbourhood teems with vestiges of their hero's standpoints, and that if we cannot accede to their claim to have furnished him with the last of these, it may be because Tacitus wrote from hearsay, and may have been more or less vague and erroneous in his account. A learned antiquary at the Knighton meeting affirmed that the Breidden Hills, above the Severn, do not answer Tacitus's description; but we should like to hear more about another site, suggested by Hartshorne—to wit, Cefn Carnedd, on the western bank of the same river, near Llandinam, in Montgomeryshire. This site, like that latest mentioned, would lie in the undoubted territory of the Ordovices. It may, however, comfort zealous and patriotic Knightonians to be assured that the question is one which can never, at this point of the world's history, be clearly settled.

THE SCHUMANN FESTIVAL.

IT is two years since Bonn, as the birthplace of Beethoven, was chosen as the scene of the musical festival which (after being put off for a year by the war) commemorated the centenary of one of the very greatest musicians whom the world has yet seen. A concert-hall was built specially for the occasion; artists were collected from all parts of Germany, and worked together for the common end with a zeal, fidelity, and diligence worthy of such an occasion. The result was eminently successful. It is no exaggeration to say that the performance of Beethoven's masterpieces attained unprecedented excellence, and it excited an interest and enthusiasm which must have been an ample reward to both leaders and followers for all the toil which bore fruit in three days of perfect music. The impression made by the Beethoven Festival was one never to be forgotten; and it was natural that Bonn should not be content to wait for a second centenary of Beethoven to see other such three days. The Beethoven Halle remained standing; the organization once called into existence for the Beethoven celebration was ready at hand; nor was a new object far to seek. The most creative and original musician of the generation following Beethoven's passed his last days in Bonn, and lies buried there. The reputation of his works, which for some time suffered from the intolerance of those who demand that all music shall conform itself to their understanding of its principles, and from the impatience of those who do not care for music that requires any understanding at all, has since his death been steadily increasing within and without his own land. The time has not been long, but it has sufficed for the full establishment of Schumann's fame; and when the word went forth for a Schumann Festival after the pattern of the recent Beethoven Festival, the success of the undertaking was assured beforehand. And, in fact, the enthusiasm excited on this occasion has been even greater than in the case of the Beethoven Festival. Whether this was due to the way having been so effectually prepared by the brilliant success of two years ago, or to the personal interest of Schumann's life and works being so recent, may be left to conjecture; but the manner in which the artists performed their part was certainly, if possible, more perfect, and the sympathy of the audience more spontaneous and complete, than in 1871.

The effect of the Festival on the general aspect of Bonn is certainly very singular. A peaceful, and in ordinary times somewhat commonplace, Rhineland town is converted for half a week into a scene of enthusiasm to which it would be difficult to find a just parallel in any other country. There is an odd mixture of solemn exaltation and simple, almost childish, gaiety, which however seems quite natural for the time and place. An Etonian reader may perhaps form an approximate notion of this disposition by imagining the Fourth of June at Eton to be still a serious and veritable commemoration of King George III.'s birthday, and all its fireworks and other diversions to be gone through with a deep sense of duty and an almost religious reverence for King George and his works.

The celebration was made up of two evening concerts on the 17th and 18th, and a morning concert of chamber music on the 19th of August. Many of the artists were naturally the same who had been prominent two years ago. Chief of these must be reckoned Herr Joachim, who is the acknowledged master of all who handle his instrument, and who has also, by the result of a difference with the Prussian ex-Minister of Education, Von Mühler, supplied a practical illustration of the principle that it is better to play the fiddle well than to govern a nation badly. On this occasion

his principal function was that of conductor, though his violin was at least heard in its usual, or something more than its usual, power, in the final concert of chamber music. Strauss was there again too, in his place of first violin—a worthy lieutenant of such a commander; and Madame Joachim came as before with her gift of song, clear and strong, as if to match the tones which her husband draws out of strings and wood. The most notable change among the leading personages was a natural, and indeed indispensable, one. At a feast of Schumann's music, given in honour of Schumann's memory, only one person could be thought of as the interpreter of his compositions for the pianoforte. The office fell, as a matter of right, one may say, to Madame Schumann, the power and beauty of whose playing are well known to all English lovers of music. On this occasion she surpassed herself, and it is almost needless to add that the active part she took in the Festival contributed in no small degree to its interest and success. Two of the leading singers were also new to the Beethoven Hall; Madame Wilt, of Vienna, and Herr Stockhausen, of Stuttgart. Herr Stockhausen's finished and dramatic rendering of German song has during some recent seasons become familiar to the English public. Madame Wilt, we believe, is very little, if at all, known in England. Together with a voice of rare quality, she has the artistic cultivation without which no natural gifts can be rightly developed. These whom we have named, with other worthy companions of whom we are forced to omit special mention, and an admirably trained orchestra and chorus, making up the whole tale to something over five hundred, were the fellow-workers who met together to do honour to Schumann in these three days of August. The results obtained were such as to give a full reward for their endeavours. It was impossible to come away from the Festival without a heightened appreciation of the composer, and a sense of gratitude to the artists who had so perfectly realized his best conceptions.

The general effect of the music was indeed not to be compared to that of Beethoven's at the former celebration. Schumann has not the volume or universality of Beethoven. In the handling of music as an instrument to express particular moods and emotions he is hardly to be surpassed; he can be intense, exquisite, discursive; but he is not comprehensive. He seldom rises above the sphere of the emotions which supply the motive of his work to the serene position of the mastery from which every part of the artist's world is seen in its due harmony with the whole. This final satisfaction and reconciliation, which is the rule with Beethoven, and is most conspicuous in his greatest works, is the exception with Schumann. He never fails to stir, but he rarely satisfies. The symphony which opened the first concert at Bonn is fiery and restless throughout. It is a conflict brought to an end at last only by main force. If there is a note of triumph at the end, it is the triumph of some overbearing and destroying destiny which strikes us with astonishment, but does not command any worship; some force which we acknowledge as irresistible, but cannot reverence as good, or even understand as necessary; and we are left bewildered witnesses of a great event the importance of which cannot be realized at the time. We miss the perfection and sufficiency of the greatest masters. Beethoven is lord of all the elements, and develops a world out of chaos; Schumann is for the most part a Demiurgus fighting with chaos and uncertain of the issue. Perhaps this is the reason why Schumann's most satisfactory works are those in which he elaborated motives already determined by a poetical text. Such are the scenes from *Faust*, of which the final part was given at the second concert of the Festival. Goethe's poetry is pre-eminent in the quality of completeness which is wanting in Schumann; and, on the other hand, the exalted vision with which the second part of *Faust* comes to an end strains the powers of articulate language to the very utmost, and may be fairly considered to stand in need of musical interpretation—the only kind of interpretation perhaps which is likely to throw much light upon it. The raptures of the *Doctor Marianus* and of the glorified Gretchen, the joy of the angels who bear up Faust's immortal part to heaven, the mystery of the final chorus—

Alles Vergänglich's
Ist nur ein Gleichniss,
Das Unzulängliche,
Hier wird's Ereigniss;
Das Unbeschreibliche,
Hier ist es gethan,
Das Ewig-Weibliche
Zieht uns hinan—

can hardly be explained by any commentary; but they are sympathetically illustrated by Schumann's music. Madame Joachim, Madame Wilt, and Herr Stockhausen were all admirable in this performance. One exquisitely sung passage of Herr Stockhausen's solo was followed by a storm of applause and a shower, which might almost be called a storm, of bouquets. It appears to be the custom on these occasions to aim the complimentary missile, not vaguely in the direction of the artist's feet, as we do in England, but straight at his head, which is much more impressive to look at, but must be now and then embarrassing. The peculiarity which we have noticed in Schumann's genius is, however, not without splendid exceptions. A notable one is the concerto which Madame Schumann played on the second day. In this the composer lifts himself to the region of pure and consummate mastery. The impression given by this piece may indeed have been partly due to the performer, for whom it was

doubtless a triumph. We doubt whether Madame Schumann has ever yet put forth her powers so completely and successfully as at this Festival.

The artistic constellation has now dispersed, and Bonn resumes its usual aspect of a polyglot halting-place of Rhine tourists, where travellers diffidently address waiters in English-German, and waiters confidently reply in German-English. But the memory of the festal days remains, and we do not suppose the Beethoven Hall will be very long allowed to stand idly vacant.

ART AT THE VIENNA EXHIBITION.

III.

IN this, our concluding notice of the pictures, we shall give such description as space may permit of the several national schools not already passed under review. Beginning with the French, we can truly say, to the credit of the Vienna Exhibition, that never, except in France itself on the special occasion of some international competition, has a collection been brought together comparable to the present. We do not hold ourselves called upon to enter here on a deliberate criticism of the great French school—a school which will probably remain, for the next half-century at least, the foremost in Europe, notwithstanding the loss which France has sustained in the balance of European power. To do justice to so large and so inviting a subject would need not a page, but a volume. We shall content ourselves with a rapid survey, and at once proceed to show the exceptional character of the collection by mentioning some few of the works exhibited. M. Boulanger proves his versatility and audacity by five well-chosen examples. Cæsar at the head of the Roman army marching through the snows of Germany is almost appalling in its voracity. M. Bonqueroau, a pretty sentimentalist, and thus a favourite with London dealers and the English public, is seen also by five works, some of a higher order than any which commercial enterprise has yet brought into the London market. M. Breton exhibits four examples of his naturalistic manner, two of which, depicting peasant life in Brittany, have been for years familiar in the Gallery of the Luxembourg. M. Cabanel, in five creations, two of them large and most important, again stands, notwithstanding his extravagance, in the foremost rank of living painters. "Le triomphe de Flore" and "La mort de Francesca di Rimini et de Paolo Malatesta" cannot be overlooked when the history of the art of the nineteenth century comes to be written. M. Corot proves the monotony of his most charming landscapes combined with figures in no less than eleven effusions of grey-green pigments, the best of which we had the pleasure of praising when exhibited in the Gallery of French Artists in Bond Street. It is curious to observe how certain pictures, in passing habitually from exhibition to exhibition, make in the end the grand tour of Europe. The numerous master works here collected of MM. Delacroix, Desgoffe, Isabey, Rousseau, and Troyon serve still further to raise names which we had thought could not possibly be more exalted. MM. Ary Scheffer and Delaroche, leaders in the opposite school, are again absent, as they ever were from even the international Galleries of their own country. Like some of our English painters, presumed to be elect and precious, they have held themselves aloof from the arena of public criticism, not only to their own loss, but to the prejudice of the principles they espoused. Two more painters, who, thanks in great measure to the commercial enterprise of London picture-dealers, are now better known in England than any of their contemporaries, excepting perhaps only M. Edouard Frère, are particularly strong in Vienna. The one, M. Gérôme, commands the better part of an entire wall by seven characteristic scenes, of which "La promenade du Harem" on the Nile may be quoted as inimitable in workmanship, and in the delineation of character; this consummate product shows, by its tender silvery greys in the water, as by the shadowy phantoms of palm trees and villages rising like a mirage on the shore, a simple love of natural scenery for which the painter has not had due credit. Four out of these seven works have been seen in London. Need we say that the other artist to whom we refer is M. Meissonnier, here more than ever conspicuous by a composition of unwonted size and complexity—Napoleon in 1807, on horseback, surrounded by his staff and in the midst of his army; the foreground is reserved for a body of cavalry rushing headlong at full speed with brandished swords and loud shouts. This very remarkable work, nine feet long and four and a half feet high, lent by Sir Richard Wallace, is naturally viewed by the Germans with admiration and wonder. The picture shows unaccustomed largeness of execution. We must here unwillingly stop in justice to the claims of other nations. We will just add that the 657 works collected fairly represent the very many artists who, unlike those already named, have yet to acquire a European reputation. We are glad to see again "Le marchand d'esclaves," a chief work in the salon of 1867. The painter, M. Victor Giraud, we are sorry to say, died two years ago at the early age of thirty; the State has possessed itself of this pledge of genius. When will our Government pay like tribute to native talent? One cause of the exceptionally high character of the French Galleries is that more than one hundred and fifty pictures are contributed by the State.

Italy makes a strenuous effort to show to advantage at Vienna, but we regret to state that seldom has there been so sad a display as that made by the 277 pictures here ambitiously placed on view. The

art of modern Italy has been for several generations obsolete and effete, but latterly a revival has set in; yet the new life, with few exceptions, is as bad as the previous decay and death. Here are present all the styles that have ever been known to exist, and yet not one work is the best of its kind. A place in the International Salon of Honour—a kind of tribunal for distinguished talent—has been accorded to Signor Giannetti's "Relieve of the Queen of Hungary." This attempt at a noble historic style is distinguished almost as a matter of course by feebleness, refinement, and conventionality. It is certainly the reverse of an advance on "The Banishment of the Duke of Athens," by Francesco, a picture which won reward in a previous contest. A fairly favourable sample of the Italian Academic manner is given in Cavalotti's tragic scene on the bank of the river Po during the fatal inundation of last year. Signor Fazio has been scarcely so successful in the line of contemporary history when he exaggerates the portly swagger of the glib King coming from the excavations at Herculaneum. There are a few parts of tolerably well painted, and again Cavalotti's Induno, in Milan, takes the lead in that rough and ready-headed manner in which there is to bring about a revolution in the art of Young Italy. The broadscapes, like the figure paintings, are without fixity of purpose. Signor Vertuani, known on the line in our London Academy, is the only artist who approaches nature like a man, with complete independence, and unflinching truth. One chief use of the world-wide exhibitions is to tell a nation plainly when he is going to the bad.

The Swiss make a respectable show, though the fifty pictures exhibited seldom rise to the standard maintained by the great nations of Europe. It may indeed be questioned whether the Swiss have more of a national art than of a distinctive manner, one is almost tempted to say that, just as the people speak the tongue of France, Germany, and Italy, so do the artists adopt the several styles of the three countries which lie on the frontiers of the Federation. And yet when we look around this Gallery we discover, as might be anticipated, an aptitude among Swiss artists in the direction of snow mountains, Alpine pastures, cattle-herds, and peasant life. The modes of treatment are no doubt borrowed, but the themes are local and national; indeed it is instructive to observe that, as soon as a Swiss artist crosses the frontier in search of a subject, he takes a step in the wrong direction. In this exposure of national character we are once more met with the anomaly that the land of mountains and of storms, a land which most strongly excites the imagination of the stranger, leaves the native cold and prosaic. It is not the spell of imagination, but the love of country and of home, known to be inexhaustible in the Swiss, that serves for inspiration. Data in proof of these conclusions might be cited in abundance did space permit. MM. Koller, Meuron, Grob, Meyer, Stuckelberg, and Vautier are the chiefs in the several departments already indicated.

Belgium and Holland, as heretofore, exhibit in adjacent though separate rooms. Since these two nations were last weighed in the balance, little change either for better or worse has come to pass. Belgium indeed has for years, in Paris, in Pall Mall, and at Kensington, so nearly touched the limits possible to the conditions under which she works, that we know beforehand precisely how far she can go and no further. M. Gallut or the late Baron Leys cannot surpass their former selves. M. Gallut exhibits "Peace" and "War," of which every one had more than enough in the London Academy. The established position of Baron Leys is asserted by six works, all known before. M. Willems, fortunately the only perfect painter of satires now surviving, is less perfect now than he was in Paris six years ago. M. Alfred Stevens, who aims at something more than silks and satins, would justly claim our admiration for character, taste, treatment, &c., had we not seen in London, Paris, or elsewhere, all that he has produced, or is likely to produce. The same observation holds as to his brother M. Joseph Stevens, who devotes his undivided talent to that ill-used race, the harnessed and heavily burdened dogs of Belgium. In thus reiterating the complaint that there is little new, and that no progress is shown, we do but tell the old story that these International Exhibitions recur too often. We cannot, however, wholly pass over a couple of pictures which are seldom seen outside their resting-places in Brussels. One, by M. Wauters, represents the painter Van Goyen when insane. He is seated in a chair, distracted; he stands a monk leading a company of choristers with the monotonous voices may exercise madness. But the poor fellow shows himself tortured all the more. M. Wauters, having demonstrated his power, has received as a reward commissions to execute important mural paintings. One composition that calls for mention occupies a giant canvas; the subject is the "Fall of the Angels," and the painter is a madman, the late Antoine Wiertz, the astounding work of his life's labours in Brussels is doubtless familiar to our readers. M. Wiertz, consumed by vanity, cherished the hope that he could surpass any of the old masters whom he set before him to emulate, and the composition before us, it may be admitted, exceeds Rubens in extravagance. The volume and weight of this Belgian section are further enhanced by works of unusual worth from MM. Keyser, Portaels, Madou, and Olys in their several departments. We feel bound to mention as a bad sign that here and in other rooms large tickets *à rendre* are placed on the frames. Thus the Exhibition is scarcely saved from sinking into a shop.

The Dutch, who are always anxious not to be confounded with their neighbours the Belgians, make a small but laudable display. Yet M. Alma Tadema, the one signal phenomenon in Dutch art, does not appear at all, possibly because he is now a naturalized English subject. Among the best-known painters represented are M. Israels, the pathetic chronicler of peasant life; M. Bisschop, who sometimes takes the spectator back to Rembrandt; M. Bosboom, an absolute genius when within a small church interior, and one or more capital marine painters, especially M. Meulzer, who has always been fairly well placed in our Royal Academy. A survey of this Gallery shows that Dutch painters of the present day cherish the traditions of their forefathers, and emulate all antecedent styles from Rembrandt to Toniers; that, like the Swiss, they are true to their country and their people; that they do not, for the sake of the sky of Italy or the blue waters of the Mediterranean, surrender the legs of Holland and the mud of the Zuyder Zee.

In the Northern schools of Denmark, Norway, Sweden, and Russia, little calls for observation. The best Russian picture is that of the Winter Fair in St. Petersburg, a work which attracted at Kensington the attention which might have been expected from its fame in Russia. Denmark does her best, but had it the best; her distinction is that she takes the lowest place in the scale of European art. Norway and Sweden approach as closely to each other as sister nations can do. They continue as heretofore to be faithful to a twofold vocation; first, that of delineating the life of the peasant in those Northern latitudes, as in the genre compositions of MM. Tidemand, Fagerlin, Jeunberg, and Nordenberg; and secondly, that of giving a faithful and loving transcript of fjords, torrents, waterfalls, and forests, as in the landscapes of MM. Gude, Holten, M. Muller, and E. Borg. These products from the North strikingly illustrate the law everywhere proclaimed within these Galleries, that a national art is true, strong, and vital just in proportion as it proves itself faithful to the life of the people and to the local aspects of nature.

It is with pain that we speak of the humiliating position forced upon our English artists. Seventy-two pictures, even though they had been better selected than the ones now exhibited at Vienna, cannot possibly do justice to our native school. Yet we know that Germans appreciate the English collection even such as it is. Still every one must feel that English pictures, usually limited to cabinet size, and to the most part content with a genre treatment, not only suffer when brought into competition with large canvases from France and Germany, and even from Italy and Russia. We devoutly wish that it were possible for the whole Royal Academy to go over bodily to Vienna. Academicians and Associates would then have to confess, as did Sir Joshua Reynolds in the Vatican, that they were brought into contact with noble works whereof they could not so much as comprehend even the rudimentary principles. Yet we naturally looked for some compensation in the direction of English landscape and of native water-colour drawing. But the good cause of the one was rendered hopeless by two chief productions from the pencil of Mr. Richard Redgrave, R.A.; while as to English water-colours, what do we find? Why that here conspicuously are the men and the works that stand at a discount in London. The space assigned to England is avowedly inadequate; and yet, as if to make bad worse, the walls reserved for the fine arts are usurped by botanical diagrams and other abortions of "science and art." Never before has a nation gone into battle more deliberately courting defeat. It is right that our English painters, sculptors, and architects, when they find themselves humiliated in Vienna as they were in Paris, should know that it is to their generous and disinterested friends at South Kensington that their gratitude will be due.

In our next article we hope to speak of the Sculpture of the Exhibition.

REVIEWS.

TEUFFEL'S HISTORY OF ROMAN LITERATURE.*

IT is a good sign when one German Professor undertakes an English translation of a sterling work by another German Professor. Dr. Wagner's English is often far from idiomatic, and now and then he uses words in odd senses; but there is never any doubt about his meaning. We have before now had to deal with English translations of German books done after such a fashion that we have had to turn to the original to find out the meaning of the translation. We have not seen Professor Teuffel's own text, but we have certainly not had occasion to wish for it for that particular end. Dr. Wagner says, doubtless with truth, that he has "more than once found it difficult adequately to render the author's meaning in English, and that he is aware that his translation is sometimes awkward, because he has endeavoured to be rather faithful than elegant." He tells us that "the German work is not a great achievement in point of style," and that "there is not the slightest doubt but that many English readers will pronounce the present work 'dry and heavy.'" Well, there is no denying the truth; Professor Teuffel's book is dry and

* *A History of Roman Literature.* By W. S. Teuffel, Professor at Tübingen. Translated, with the Author's Sanction, by Wilhelm Wagner, Ph.D., of the Johanneum, Hamburg. 2 vols. London: Bell & Sons. 1873.

heavy; in Dr. Wagner's words, "it is a store-house of learning and exact scholarship rather than a brilliant composition." We do not think that Dr. Wagner goes too far when he speaks of Professor Teuffel's book as "being acknowledged as the standard work on the history of Roman literature"; but the author has certainly taken no small pains to put a great deal of valuable matter into as repulsive a shape as he could. It is a book of the old German type, which seems not to be meant to be read, but only to be referred to. Mommsen and Curtius are eminently books to be read; but Professor Teuffel's book comes to little more than a dictionary put into chronological order. Now a dictionary in alphabetical order is a dictionary, and there is no mistake about it. We should feel it a serious loss if our Potthast's *Wegweiser* were to be taken from us; but we never thought of reading our Potthast straight through. Now it is not fair to put Teuffel and Potthast on the same level, because Potthast is simply a dictionary, while Teuffel is a history, and a very valuable history. But when the history and the biography and the criticism and the references and extracts and lists of editions and notices of reviews and articles all come, if in different types, yet in one consecutive text, the thing is made ugly to look at and unpleasant to use.

We had hoped that this kind of thing was going out of fashion in Germany as well as in England. And it is the more pity that it should have been fallen back upon in the case of a book where the matter itself is so excellent. A History of Roman Literature, one especially conceived in the wide and liberal spirit in which Professor Teuffel's work is conceived, should have been a book which could be read and not only referred to. Foremost among its merits is that it really deals with Roman literature as a whole, and not merely with the literature of two or three arbitrarily chosen centuries. It does not seem to be Professor Teuffel's way to put anything forth in a bold and striking manner; otherwise one might have looked for some vigorous assertion of the true position of the Latin language in the history of the world. But, if he does not formally set forth, he not the less practically acts on, the doctrine that the tongue of Rome is something more than the mere tongue of Cicero and Virgil, something more than a tongue in which schoolboys may be set to make imitative verses, something more than a tongue whose literature may supply speakers in public assemblies with hack quotations. Professor Teuffel, in short, altogether rises above mere classical exclusiveness. We have here a History of Roman Literature in which their full space is given to those branches of it to which the tongue and the dominion of Rome really owe their abiding and Imperial character—to the legal and to the Christian writers. It is something to find a list of Roman writers which does not stop with Juvenal and Tacitus, which does not even stop with Ausonius and Claudian, but the last names in which are Eadhelmi, Beda, Tatwine, and Winfrith, otherwise Boniface. We should have been well pleased to have gone on further still, at least, we think, to the twelfth century. Roman literature, it strikes us, comes to an end where Romance literature begins. At that point Latin ceases to be the universal language. Long before that time it had been used, as the list of English writers we have just quoted shows, by many whose native tongue it was not. But it was still the universal tongue; it was the only tongue which men in the old Western provinces of Rome thought of writing. It was when men in Italy, Gaul, and Spain found out that the language which they spoke had become something essentially different from the language which they wrote, when they found that it was possible to write as well as to speak in the despised vulgar tongue, then, and not till then, the Latin tongue ceased to be universal. Beda had written in Latin, as Jornandes had written in Latin, because it was the universal tongue of the West, the tongue which was native to all save barbarian Goths or Englishmen, and which was the only tongue that barbarian Goths and Englishmen needed to learn. That the Teutonic nations, both within the Empire and within the other world of our own island, adopted Latin as their literary language, is, in truth, the greatest of all trophies of Roman conquest. It is when new tongues spring out of Latin itself, when men begin to write Italian, Spanish, Provençal, or French by the side of Latin, that the dominion of Latin is for the first time seriously shaken. For a long time the use of the Latin language had been something artificial. Men thought and spoke in Romance, but, when they had to write, they exchanged their Romance for Latin. But as soon as the Romance tongues began to be written, the use of Latin was not only artificial, but consciously artificial. Dante must have turned over in his own mind the question whether he would write his great poem in the language in which he spoke or in the language in which he wrote his political treatise. As soon as this recognition of the Romance languages is accomplished, native Latin literature comes to an end. The case is different from that of a foreigner writing Latin in any age. Latin is supplanted by its own children, or, more strictly, by later forms of itself; it is no longer the one tongue which suggests itself; it is something archaic, something chosen by preference, instead of another tongue which is more familiar. It will of course be remarked that, alongside of this recognition of the Romance languages, which we may look on as spread over the eleventh, twelfth, and thirteenth centuries, there begins to be a great improvement in the Latin literature of the time. This is what could not fail to happen. As soon as men became fully conscious that Latin was not their own natural tongue, they began to write it with the care and accuracy with which men write a strange tongue. It had been so with foreigners all along. There never was any time in England in which men wrote such prose as those with which the Italian poet commemorated the imprisonment of Lewis the Second.

We think then that Professor Teuffel might very well have gone on a little further, and might have traced the history of Roman literature till it split asunder into a natural Romance and an artificial Latin literature. At the same time our feeling towards him is one of pure thankfulness for having carried it on so far as he has done; the great point is gained when a History of Roman Literature overleaps the artificial classical barrier, and gives us not only Augustin and Jerome, not only Boetius and Cassiodorus, but our own Beda and Boniface. This witness is the more precious, as it is plain that Professor Teuffel starts from the classical point of view, but that he has seen that a History of Roman Literature, to be what its name professes, must rise above classical narrowness. When a man fully understands that the classical Latin poets, with their imitative Greek metres, are really interlopers, and that the mediæval Saturnians are the true representatives of the old Saturnians of Nævius, then he really understands the history of Roman literature, but not till then.

Professor Teuffel's book is not a History of the Latin Language, but a History of Roman Literature—two things which are quite distinct. With the forms of the language therefore, and with its relations to other languages, he has little to do. But he has to do with every scrap of extant Latin writing from the earliest times to the latest, and he certainly has gone through the whole of his task with amazing thoroughness. He has recorded, we are not ashamed to say, a great number of writers of whom we had never before heard, and we do not see that the book at all flags when it draws near to the end. Each author comes in his proper order, with comments on his literary and historical position, with a list of his writings, illustrated by such comments as each suggests, and a further list of the editions and of modern writers who have dealt with them. It is all this which, as we have said, is put together in a way which Dr. Wagner allows to be dull and heavy, and which certainly does remind us of a Bibliographical Dictionary put in chronological order. But the matter which is thus thrown into a needlessly repulsive form is as good and full, and, allowing for some of the oddities of the translation, as clear, as it well could be. We have never seen any book in which such a vast amount of information about the Roman writers and their works is packed so close together in a form which, though certainly wearisome to read through, is easy enough to consult. It would perhaps have been easier still if the references in the index had been made to pages instead of to sections or paragraphs—a way which is always puzzling at the moment of reference, though it has the advantage of not involving so much change in the case of successive editions.

The book, however, is not so purely bibliographical as might seem at first sight from merely turning over the pages devoted to any particular author. Professor Teuffel skilfully groups the various departments of Roman literature according to periods and according to subjects, and he well brings out the leading characteristics of each. At Rome, as elsewhere, verse came before prose, and Latin prose composition was checked in a way in which Greek prose composition was not—in the same way, in short, in which Latin itself afterwards checked the growth of the modern languages of Europe. The beginning of Latin prose writing, as distinguished from the publication of mere legal formulae, is placed by Professor Teuffel with the publication of the speech of the Censor Appian Claudius against peace with Pyrrhus. Then came a time in which the growth of the native literature was checked through the fashion of the Roman historians writing in Greek, just as the mediæval historians wrote in Latin. It is with another famous Censor, the elder Cato, that the prose literature of Rome really begins again. On this Professor Teuffel begins to comment:—

For long, however, the written speech remained insignificant by the side of the spoken one, and became its equal only in the time of Cicero, when the prose attained to its climax and became the adequate expression of the author's individuality. A rhetorical character remained to it for ever from its origin. In the first century of the Imperial period it begins already to decay, by being mixed with poetical diction and becoming estranged from natural expression. The decay of accident and syntax begins also about this time. Later on, the plebeian element found admission. And when the influence of provincial writers who were not guided by a native sense of language and who mixed up the diction and style of all periods, became prevalent in literature, the confusion became still greater. The language of literature became more and more different from the living language, and became entirely dependent upon the culture attained by each writer, which continually fell to a lower level. The more the provincial idioms were developed into the Romance languages, the more did Latin become a strange tongue.

This last remark naturally leads to the line of thought in which we ourselves indulged a little while back. Professor Teuffel goes a little later:—

The centuries during which Rome possessed no literature and the real greatness. Her literature arose through the demands of a stage, when the instruction gained by youths from accompanying fathers to the market-place and into the Senate appeared no longer sufficient, and when the stage was expected to give continuous instruction besides the customary national farces and dances. The Roman literature was, therefore, from its very beginning under the influence of the Greek, through this it was called into life, remained in its way always dependent on it, and thus could gain ground only at the expense of the genuine Roman character.

In short, the book, though it is rather hard work using it, is one which we can thoroughly recommend, and we are not surprised at the success which it has already met with among the scholars of its own country.

TRISTRAM'S LAND OF MOAB.*

WE have always had a little grudge against books of travel, though travel books are the most delightful reading in the world. The grudge springs simply from a sense that every traveller is robbing us of a little of the unknown. The griffins and strange beasts that marked the unexplored spaces of the older maps have hardly a waste left to browse in, and every season brings a new adventurer to the Geographical Society with a fresh bit of the undiscovered in his carpet-bag. The one chance of preserving a fragment of the world's mystery lay, as we had fondly hoped, in the Bedouin and the Turcoman; but the great Asian mystery has all but ceased to be a mystery since the Russian bayonets pushed their way to Bokhara, and now Mr. Tristram presents us with the inevitable octavo which solves for ever the problem of Moab. The problem, too, is solved with a fatal completeness. When Burton wanders alone to Medina, or Livingstone undertakes single-handed the exploration of the Nile sources, there are always nooks which they are forced to avoid, and certain departments of human knowledge which escape their scrutiny. But Mr. Tristram strictly follows Biblical precedent. He goes through the land to subdue it, and his company "licketh up the very grass thereof." Arab sultans protect him from the lances of the Desert. If he gets into trouble at Kerak, Pachas move armies to deliver him. His party is ready for every emergency; however wild are the savages he meets, he has a missionary to spring on them who is familiar with their tongue and their manners; he has a botanist for every shrub and a photographer for every ruin. And, besides all this, he is a host in himself—naturalist, philologist, antiquary, geologist, Nimrod; he is equally ready with his gun and his fossil-hammer, his Bible or his Arabic, equally adept in solving the difficulties of Bedouin etiquette, or stuffing a vulture, or determining a site. And besides all this, he carries a pen, and a very deft and ready pen, and when there is anything to tell he knows how to tell it; and so Moab has been reft from the domain of the unknown and the unknowable, and lies all mapped out and photographed and described in a very pretty little octavo for our drawing-room tables.

Not that Mr. Tristram is without his adventures by any means. There is an imprisonment at Kerak which agreeably breaks the middle of his story, and there is a most effective skirmish at its very opening. As the little party rounded the southern end of the Dead Sea they came upon "a savage-looking lot," who held the boundary line between Edom and Moab with a confidence worthy of olden days:—

They were a savage-looking lot, more like Maoris, or Fiji Islanders, than any western race, as they yelled and capered, evidently meaning mischief, and stripped for the fight, for the Bedouin, unless mounted, always go naked into battle. Some had guns, some spears, a few huge swords, and many only most formidable clubs, or maces with a round spiked head.

We were bewildered for the moment, and I feared the Sâfîh was destined to be, for the second time, a turning point for me. Suddenly our gallant old sheik, Selameh, dashed across the stream to parley with the single mounted horseman, a fine-looking, wild fellow, clad in a sheepskin coat with the woolly side in, and painted yellow. Several shots were fired harmlessly from the other side, but none in return from ours. As the old sheik mounted on the opposite bank, his horse sank in the mud, and rolled over; in an instant he was dragged out by the ruffians, his gun and all else taken from him, and he was lost to our sight in the mêlée.

Some of the foe now waded across to where we were standing in line by the edge, apparently aiming at capturing some of the mules behind. One of our Jehalin footguard, a fine young Bedouin, who was my special companion, and had been also with me on my former expedition, tried to push them back, and was instantly felled senseless to the ground, by the butt end of a gun, which cut his cheek to the bone. Another fellow came up, as if to despatch him with his club, but was held back by his own party. Old Hamzi now came to the front on foot, assured us that it was a tribal quarrel, and that we had nothing to do with the fray, and, barelegged, waded across in great excitement, when he too was lost in the yelling crowd.

But the skirmish turned out to be a sheer mistake, and a liberal baksheesh soon opened a way through the border country into a land "which has not been traversed at leisure by any explorer since the fall of the Roman Empire"; for hurried visits to a few of its more obvious sites, such as the visit of Irbay, have little in common with the very thorough exploration which Mr. Tristram was able to accomplish. The country is in effect a high table-land lifted some four thousand feet above the level of the Dead Sea, into which it falls to the westward in a succession of gentle valleys which narrow as they descend into wild ravines, while some thirty-five miles to the eastward it is again bounded by the low and barren ridge of limestone which forms the watershed, and is the conventional boundary of Arabia. Across this strip of table-land runs the great gorge of Arnon, breaking it into two portions, which seem always to have preserved a remarkable distinctness in physical and political character. To the north lie the great pastoral reaches where Reuben abode "among the sheepfolds to hear the bleatings of the flocks," a country which had been previously traversed and described, though not very accurately, by Biblical explorers. To the south lies the district which remained to the Moabites, and which served as a base from which they were again able to regain the country which had been torn from them by the Israelites—a district about which very little has been hitherto known, and whose minute description in the present work is a remarkable contribution to geographical and Scriptural research. Its character is that of a

land of tillers, as the character of the northern district is that of a land of shepherds. Knolls of bare limestone rise here and there out of the rich red loam which forms the general soil of the plateau, and which has been swept down by water action from the eastern hills. "Had the country," remarks Mr. Tristram, "been without these excrescences of rock, affording unlimited facilities for cistern excavation, and for the storing of water supplies, it is utterly impossible that it could ever have sustained, as it has done, a vast resident and agricultural population." As it is, after all the waste of time, its resources remain really unimpaired. The wells remain as of old. The limestone knolls are still honeycombed with vast cisterns that need only to be put in order. The soil is still fertile, and nothing is wanted but a settled government and the simplest conditions of peace and order to restore Moab to its old prosperity.

In reading accounts of the more sacred ground west of the Jordan we are often inclined to sympathize with Mrs. Burton's piteous protest against the peculiar enthusiasm which she styles "Holy Land on the brain." Whatever other attractions Palestine may have, nature has made little there to see, and man with his wars and Crusades has left—if the Exploration Fund will allow us to say so—very little to discover. But on the eastern side of Jordan, and, above all, in Moab, the scenery is often on a scale which needs no enthusiasm to enjoy, while the remains of the past have an interest to the architect and the antiquary which can hardly be equalled elsewhere. Each of the limestone knolls we have noticed is crowned with the ruins of a forsaken city, Greek, Herodian, Roman—in one memorable case Persian—here and there turned in later times into the fortress of the Crusader or the hold of the Arab chieftain, but for the most part abandoned and left to quiet decay ever since the Saracen wave rolled over them in the first years after the death of the Prophet. A ride of a few hours carries the traveller past buildings which would be notable anywhere, and which exercise a strange fascination as they stand silent in the Moabite waste. On the ride from Rabba, which we take at a venture, Mr. Tristram traverses a Roman road with three Roman milestones prostrate beside it. In an hour's time he comes upon "a tolerably perfect little Roman temple," with its adytum still standing, and the pillars thrown down beside their bases. A few more miles bring him to the great temple of Kasr Rabba, its gigantic columns still lying shattered as the earthquake left them. Another ride leads through terraced gardens walled by blocks of basalt to the Roman debris of Shiloh, with a vast view from its hill-top far away to Jerusalem and Mount Her. There is hardly one of these ruins at which one is not tempted to stop and ask for a little digging and delving, but the interest of none of them equals that of the exquisite palace of Mashita, whose discovery would alone have made Mr. Tristram's excursion a very memorable one:—

Suddenly drawing rein in front of Mashita, after a headlong dash at a herd of gazelles across the Hadj road, we were astonished at the unexpected magnificence of the ruins, unknown to history, and unnamed in the maps. It has evidently been a palace of some ancient prince. There is no trace of any town or buildings round it. The only remains, outside the walls, are those of a deep well near the S.W. corner. It must have stood out on the waste, in solitary grandeur, a marvellous example of the sumptuousness and selfishness of ancient princes.

We were at first perfectly bewildered by the variety and magnificence of the architectural decorations. The richness of the arabesque carvings, and their perfect preservation, is not equalled even by those of the Alhambra, though in somewhat the same style. The whole consists of a large square quadrangle, facing due north and south, 170 yards in extent on each face; with round bastions at each angle, and five others, semicircular, between them, on the E., N., and W. faces, all, like the wall, built of finely-dressed hard stone.

But it is on the south face that the resources of Eastern art have been most lavishly expended. There are here six bastions, besides the corner ones; for the fretted front, which extends for 52 yards in the centre of the face, has a bold octagonal bastion on either side of the gateway. This gateway is the only entrance to the palace, and on either side is the most splendid façade imaginable, of which our photographs alone can convey a correct idea. The wall is 18 feet high, and covered with the most elaborate and beautiful carving, nearly intact, and hardly injured either by time or man.

Mr. Tristram has added a conjectural restoration of the ruins by Mr. Fergusson, which seems to us to be built upon a number of very loose guesses and hypotheses, such as that of a substantial identity between work which he admits to be in effect Roman work of the seventh century after Christ and the work of Assyrian builders in we know not how many centuries before the Christian era. But Mr. Fergusson's familiarity with the architecture of India gives a very different importance to his conclusion that in the palace of Mashita, which he believes to have been erected by Chosroes as a hunting lodge during the few years before the reconquests of Heraclius in which he remained master of Syria and Asia Minor, we possess the only known link between the Roman architecture of the West and the great lines of Eastern buildings which are represented by the Jumna Masjid at Delhi. The earliest Indian mosques are of the thirteenth century, and the "wide gap" between this date and the seventh "can only be bridged over by buildings in Persia and the countries between that and India," which he believes still exist to reward some day the research of the architectural investigator. But even across this gap he is able to trace a substantial identity between Mashita and the Indian buildings in ground-plan, the elevation of their façade, and the elaborate style of decoration which is common to both. "That peculiar conventional treatment of vegetable forms which is the principal beauty of the façade at Mashita is reproduced, without the animals of course, in almost all the mosques at Gujarat." This is not the place to discuss Mr. Fergusson's theory, but the mere fact

* *The Land of Moab: Travels and Discoveries on the East Side of the Dead Sea and the Jordan.* By H. B. Tristram, M.A., LL.D., F.R.S., Hon. Canon of Durham. With a Chapter on the Persian Palace of Mashita, by Jas. Fergusson, F.R.S. With Map, and Illustrations by C. L. Buxton and R. C. Johnson. London: John Murray. 1873.

that he assigns so important a place to the palace of Chosroes is enough to direct attention to Mashita, even if one were not attracted by the exquisite instances of wall ornamentation which Mr. Tristram has given in the illustrations to his book.

But though explorers are bound to give attention to ruins, it is pretty plain that Mr. Tristram's natural taste does not lead him to stones. He is a very fair antiquary, and he is a keen geologist, but he only really kindles at the sight of birds of the air and beasts of the field. There is an unpleasant air of "sport" running throughout the volume; guns are perpetually going off, and this thing or that thing being "bagged"; but sport is allowable enough when, as in this case, the game-bag supplies the dinner-table and furnishes the one relief from perpetual boiled mutton, or when science glorifies butchery, and the bird is fetched down to be properly tabulated under its genus and species. But there are some creatures that have been described too often to give any excuse for murder on the score of science, and which certainly afford no excuse for it on the score of the table, and we could heartily wish that the page had been blotted from the book where its author pictures his party rushing into the midst of a flock of vultures, and for want of guns breaking the poor creatures' legs with the butts of their riding-whips. Still, to do him justice, Mr. Tristram prefers live birds to dead ones, and one of his liveliest sketches is that of the bird-life over Arnon:—

While we stood on the edge, looking down into that noble rift, the great birds of prey were rallying forth to forage. The griffons circled and soared from their eyries lower down, till lost to sight in the sky: the buzzards lazily flapped their heavy wings as they crossed and recrossed; but, grandest ornithological sight of all, a pair of lammergeyers (*Gypaetus barbatus*), the largest on the wing of our raptorial birds, kept sailing up and down, backwards and forwards, quartering the valley, and keeping always close to the brow, the sinuosities of which they followed without a perceptible movement of their wings; only their long tails gently steering them in and out, as each time they passed us, easily within gunshot, on a level with our eyes. They were perfectly fearless, as though they knew the sportsman had only No. 7 in their barrels; and in the morning sunlight their brown tails and wings gleamed with a rich copper hue, and their ruddy breasts shone brightly golden.

Quite as fresh and delightful is the description of Callirrhoe and the great gorge through which the sulphur springs make their way to the Dead Sea. After endless rides and endless ruins, the scramble in this wonderful gorge is a treat which the reader enjoys as keenly as the scramblers themselves seem to have relished it. By an amusing sort of irony, considering the very religious and Sabbatharian tone of the party, their guides chose to implicate them at this spot in an act of devil worship by their sacrifice of a lamb to appease the demons whom their presence was supposed to disturb. Nothing is more amusing through the journey than the lights and shadows of Arab life which it brings us across. The wild Beni Ateyeh and their skirmish at the ford, the robber chiefs of Kerak, the courteous and chivalrous Zadam, chief of the Beni Sakkr's, the Bedouin tribes migrating in long lines of camels across the waste, the hunt after the stolen horses, are all charming pictures of the life of the Desert. Our favourite in the whole book is one Goblan, a tall, spare fellow, over sixty, with a grey moustache, a sabre cut along the cheek, and a bloodshot eye, who tells the story of his first crime:—

When a very young man, riding over the plain, he noticed a horseman before him on a splendid iron-grey mare: the demon seized him—he resolved he would have the mare, and, watching his opportunity, he speared the rider, and carried off the animal. The murdered man was a Beni Sakkr's, though not of Zadam's sept. The man was recognized, and the crime suspected. Years have passed, and Goblan knows not the name or the family of his victim: but he feels sure that some one has vowed vengeance, and that he shall yet suffer retribution. "I cannot sleep," said he, "without seeing the grey mare and her rider before me. But she was a splendid mare! Who would not have killed a stranger for her?"

But, as we have said, there are other things than good stories in this book. The explorers did a great deal of careful and valuable work; the verification of the site of Macharus, the discovery of that of Zoar; and, above all, the exploration of Mashita, would suffice to raise this expedition above the general level of similar journeys. An account of the flora of Moab, contributed by the late Mr. Hayne, who acted as botanist to the party, is chiefly interesting as confirming and developing the conclusions previously arrived at by Mr. Lowe from his survey of the shores of the Dead Sea. Altogether the book is a very interesting one, and we can only hope future explorers will imitate Mr. Tristram's party in the zeal and thoroughness of its research.

A SIMPLETON.*

THOSE stupid and malicious beings, the anonymous critics, have, we regret to say, been once more vexing the peaceable soul of Mr. Charles Reade. Their last charge against him, made in "studiously courteous terms of course," is that he is a plagiarist. Mr. Reade accordingly annihilates these wretched cavillers in a preface to his new volume. He replies that he borrows facts from every accessible source, but is not a plagiarist; he appropriates raw materials, in other words, but does not steal the manufactured article. Mr. Reade proceeds to boast of the variety of the sources from which he draws, and assures us that he rarely writes a novel "without milking about two hundred heterogeneous cows" into his pail. Now as we have not been watching for criticisms upon Mr. Reade with that anxiety which the importance of the topic seems to him to justify, we are unable to say whether he puts a fair

interpretation upon them. Taking his account of the matter, however, we agree that the charge is absurd. It is a preposterous misuse of language to call a man a plagiarist because he gets up a subject before he proceeds to write about it. And Mr. Reade is perfectly right to study "men, journals, blue-books, histories, law reports," and anything else that comes in his way before describing the prisons, lunatic asylums, or manufactories, with which he may be dealing. Indeed, the accusation, as he states it, is so silly that we have a lurking suspicion that he may have misunderstood his accusers. Perhaps, if we may venture upon a conjecture, they meant to make another charge, which would bear not against Mr. Reade's literary honesty, but against his skill as an artist; and to which, in our opinion, the answer would be not quite so easy. They meant, it may be, not to deny Mr. Reade's right to seek for materials wherever he could find them, but to complain of his method of turning them to account. They would fully admit, for example, that a novelist ought to read a blue-book about Trade Unions before writing a story which turns upon trade disputes; but they would add that undigested lumps of blue-book ought not to appear in the finished product. If this were the intention of the criticism, however badly it might be expressed, we should be inclined to say that there was some force in it; and, indeed, that the fault thus indicated goes far to explain why Mr. Reade's books, with all their undeniable merits of vigour, decision, and brilliance, have yet a certain stamp of inferiority.

We may best illustrate our meaning from his present performance. The *Simpleton* is unmistakably a good novel. It carries the reader along with it. The adventures, when measured by Mr. Reade's scale, are not altogether preposterous; and, in short, though one is sometimes inclined to laugh when the author means us to be impressed, we admire its audacity and liveliness. The characters are of course those with which Mr. Reade has made us familiar in we know not how many previous stories. There is the regular type of handsome healthy young woman, with strong affections and inferior reasoning powers, coming right by intuition instead of logic, saying No when she means Yes, and most ashamed of herself when she is blundering into some action of unselfish heroism. In fact, there are, as usual, two of these young women—one in the costume of a lady, and the other, for the sake of contrast, in the costume of a farmer's daughter. We know them perfectly well, and like them very much; though we are a little surprised at the complacency with which Mr. Reade hugs himself on his knowledge of human nature when for the hundredth time he unravels the secret of feminine coquetry. Then, equally of course, there is the noble young man with big brains and muscles, who goes about exposing medical and other pedants with a few pithy common-sense maxims. He is always equal to any emergency, and whether he is turned adrift on the Atlantic Ocean or exposed at night in an African desert, he always has about him the ball of string or the pair of scissors which, such is his ingenuity, supply him with the means of overcoming sharks and tigers, whether bestial or human. On this occasion he is a doctor, and invariably sees at a glance the simple cause of the evil which has evaded the penetration of all the stupid old fogies who call themselves regular practitioners. The adventure upon which the novel turns is one of those good old-fashioned catastrophes which have been part of the common stock of novelists time out of mind. The admirable doctor is married to one of the admirable young women, who has unluckily no knowledge of housekeeping. They get into difficulties, and the doctor has to take an appointment which involves a separation. Then, by a strange series of adventures, he is supposed to be drowned, and escapes only at the price of losing his reason for many months. Consequently his wife goes through the usual brain fever, remorse for previous extravagance, conversion to better habits for the sake of her orphan son and her husband's memory; and, finally, a temptation to marry a clever scoundrel. We need hardly say that this last trial happens very near the last page of the third volume; nor shall we insult our readers by hinting at the conclusion. "As to the plot and characters," says Mr. Reade, "they are invented." In one sense they undoubtedly are; the characters were invented a good many years ago when Mr. Reade first took to novel-writing, and we can only congratulate them and him on the immense vitality, whether in him or them, which still enables their creator to follow their fortunes with as keen an interest as ever. As for the plot, we have certainly never read anything precisely like it, but we do not imagine that its contrivance can have inflicted any great torture upon a brain so ingenious and fertile as that of Mr. Reade.

We return, however, to the criticism from which we started. The course of the plot, as it will be seen, involves, besides other details, a good deal of medical business, some nautical business, and, as the hero turns up at Cape Town after his escape, some South African business. Mr. Reade gives us his authorities in each of these departments. His medical knowledge, he tells us, comes partly from personal experience, partly from books "far too numerous to specify." The nautical details were supervised by two practical seamen. For South Africa he gives us a list of authorities, but his chief obligation, he says, is to Mr. Boyle, who wrote and has republished some admirable letters to the *Daily Telegraph*. Mr. Reade, it may be admitted, has crammed himself (we do not use the word in an offensive sense) elaborately for his task; and so far we are grateful to him. When we come, however, to inquire into the use of his materials our commendation must be more qualified. To take instances, we have no objection to one result of his medical studies. The hero, as we have said,

* A Simpleton. A Story of the Day. By Charles Reade. London: Chapman & Hall. 1873.

loses his reason, and, as it returns, only recovers his memory in a strangely fluctuating, capricious manner. There are cases on record justifying this description, and Mr. Reade has turned them to good account. A man in whose memory all events previous to a certain date have been completely blotted out is not only an interesting phenomenon to physicians and psychologists, but is in a very pathetic situation. He is therefore a fit subject for art; and Mr. Reade uses his patient skilfully. The efforts to regain the lost thread of memory, the pain felt when certain old memories start again into life—these and other strange combinations of thought and emotion give interest to the story; and, if a more delicate artist might have turned them to better account than Mr. Reade, they still impress us when portrayed in his vigorous blacks and whites. But, if this is an instance of a fair use of cram, we can hardly say as much for some of the nautical information. Here, as elsewhere, Mr. Reade gives us irrelevant bits of information which have no conceivable bearing on the story or its development; and which at most could only be defended on De Foe's principle of attempting to deceive us into belief by the very fact of their irrelevancy. Nobody, however, could give to a story so palpably melodramatic as *A Simpaton* more than that amount of belief which we ordinarily concede to fiction, even were it not too plain that these fragments of irrelevant matter are dragged in, partly because Mr. Reade is too much pleased with his recent information not to exhibit it, and partly because it gives him a chance of trampling upon various idiotic prejudices common amongst mankind. Thus we are suddenly introduced to the sea-serpent for no particular reason except by way of expressing Mr. Reade's passionate conviction that people who deny the existence of sea-serpents on *a priori* grounds are fools. It is odd that any one should be so anxious to denounce this particular form of folly as to drag a sea-serpent into a novel for the express purpose: for, after all, we don't happen to know any one who denies the possibility of sea-serpents as big as whales, though the evidence for their actual existence is unluckily very doubtful. In this instance the superabundant pugnacity indicated in the superfluous assault on the sceptics has a kind of humorous effect; but elsewhere the constant intrusion of the odds and ends of facts which Mr. Reade thinks it may be useful to us to know, and which he assumes that we are perverse enough to ignore, becomes rather tiresome. A novel ought to be a novel, and not to be stuck over with hints upon housekeeping, plans for killing sharks, suggestions as to ostrich farming, and observations upon the geology of "diamondiferous" strata. The hints, it is true, are introduced under cover of illustrating the hero's cleverness; but one can't help feeling that the hero is Mr. Reade in disguise, bursting with stores of information just laid in, and unable to refrain from communicating them. We have, however, a still more serious objection to Mr. Reade's method. He names about a dozen books on South Africa which he has read for the purposes of this novel. Now we frankly confess that our acquaintance with African scenery is not sufficient to enable us to judge directly of the merit of Mr. Reade's descriptions; but we must confess to a profound distrust of such compilations. No description of scenery which we have ever been able to compare with the original was worth a farthing unless done from actual observation, and few are good for much that have not been at least prepared on the spot. Now Mr. Reade, with all his talent, is not an exception to the rule. Whether he makes many actual blunders or not is more than we will say; but nobody can mistake the second-hand nature of his descriptions. Mr. Reade's enviable self-reliance takes him too far when he fancies that he can really paint a picture without seeing the original, and do Africa without moving out of his study, by a few guide-books, popular travels, and letters of newspaper correspondents.

Without giving more instances, we may say that our view of the proper limits of a novelist's art is unfortunately different from Mr. Reade's. We are glad that on this occasion he has not treated us to a political or social disquisition disguised as a story; but we could wish that he had also refrained from emptying his note-books quite so recklessly. Perhaps we are treating the whole affair rather too seriously; the author seems often to be writing as if he were indulging in a practical joke, or burlesquing himself. He can, however, show so much spirit at times that we cannot but wish for a more artistic management of his materials.

LIFE OF MOHAMMED.*

THIS very able and most interesting volume is strictly an apology for the Founder of Islam, and for the doctrines which he wrought into a system. It regards the prophet as arraigned before the tribunal of European thought, and expresses the emphatic conviction of one who is no blind and unreasoning believer in his mission, that by that tribunal he has been unjustly tried, misunderstood, and condemned. Nothing but good, we may confidently say, can come from impartial critical efforts made by the adherents of one creed to correct or remove the misconceptions formed of that creed by others; and happily there are few subjects on which the progress of thought during the present century has done so much to bring about a more healthy state of feeling as in the matter of Mahometanism, so far as Mahomet himself can be made responsible for it. The phase of opinion which marked the pages of Pridcaux, and which delighted to

paint Mahomet as a conscious impostor sent out by the devil to do his own special work, either has passed away or is confined within bounds so narrow as to have lost all influence; and to this more negative gain has been added a more truthful and generous appreciation both of the man and of his work. Mahomet has of late years had many biographers, and there is not one among them who has not set himself patiently to sift the grains of truth about his career which may have been mingled with falsehood in the vast mass of Mahometan tradition, not one who has not shown a praiseworthy anxiety to avoid ascribing to him, on inadequate evidence and suspicious authority, words or acts which would tell against his good name. Some of them may have started with a bias against him; some may have felt that bias sensibly weakened as they went on with their task; some may have ended their work as they began it, with a painful sense that in the prophet of Islam not a little dross was mixed up with the pure gold. But all have seen and acknowledged that he has been charged with many offences which he never committed, and been made responsible for some doctrines which he never propounded. The result has been to reduce the points of controversy to a very small number, and to these Mr. Syed Ameer Ali addresses himself with an ability and an earnestness which should command respect, even if they may not be rewarded with complete success.

We will not attempt to praise a Mahometan of India for a command of English which few English writers possess; but we may say that it will be a good day for Christian missionaries when, in the language of those whom they seek to convert, they can utter their own convictions and plead the cause of their Master with the eloquence and force of Mr. Syed Ameer Ali. One thing assuredly they will do well to learn—and they can scarcely fail to learn it from reading this book—that the points on which the most thoughtful and educated among the adherents of the two faiths are agreed are by no means insignificant either in number or importance. It is impossible that the great work which they have at heart can be promoted by intolerance and uncharitableness; nor can the superiority of one religion over another be successfully upheld by those who obstinately shut their eyes, not to facts which seem to tell against themselves, but to those which tend to exhibit their adversaries in a less repulsive light.

Of Mr. Syed Ameer Ali it may be said in few words that, in his belief, the indictment against Mahomet which still remains to be met may be summed up under the three heads of slavery, persecution, and marriage. It is unnecessary to reserve for a fourth head the charges grounded on the alleged change in the character of his teaching, which may be said to have passed from the simplicity of absolute conviction to a condition closely bordering on conscious imposture, if not to wilful falsehood. On the subject of slavery there is not much to be said. The Mahometan may fairly argue that the spirit of the Koran is as much opposed to this primeval institution as is that of the New Testament, and that the former differs on this subject from the latter chiefly in that it defines the conditions under which slaves may be acquired. They are strictly to be captives taken in war after open fight. As Mr. Ameer Ali puts it:—

The possession of a slave by the Koranic laws was conditional on a *bond fide* struggle, in self-defence, against unbelieving and idolatrous aggressors, and its permission was a guarantee for the safety and preservation of the captives.

Nay, he infers further from this that Mahomet anticipated a very speedy ending of the incessant warfare which had been the normal condition of Arab life for centuries, and which for the present had received a fresh stimulus from the antagonism of a new creed with the old polytheism. With the zeal of an ardent defender our author asserts that, as Mahomet looked forward to the union of all the tribes in the true faith within a period of at the most two or three generations, so he felt assured that with this union the slavery which, by his restriction, could be fed only by warfare, would at once come to an end. The notion may seem to us to belong to the region rather of fancy than of fact; but whatever may be the iniquities of the nations of Islam, Christians are not yet in a position to cast stones at them. The New Testament has no positive and absolute condemnation of the system; it has existed in Christendom alike in the East and in the West, and by the great Digest of Justinian it was declared to be a constitution of the law of nature. But there cannot be the least doubt that the New Testament sets forth principles the hearty acceptance of which must excite an utter hatred for the vile injustices of a system which has filled the world with misery. Mr. Ameer Ali is not one who palliates the evil deeds of Mahometan peoples. He admits that—

To the lasting disgrace of the majority of the followers of Mohammed, it must be said that, whilst observing, or trying to observe, the letter, they have utterly ignored the spirit of the Teacher's precepts, and allowed slavery to flourish (in direct contravention of the injunctions of the Prophet) by purchase and other means.

Not very long ago the same hard words might have been applied to ourselves, and it was but yesterday that slavery was elaborately vindicated and eulogized on principle by Christian statesmen and divines on the other side of the Atlantic.

On the subject of the propagation of Islam by the sword, the author's defence seems to be less successful, although here too the controversy must be confined to the sayings and deeds of the Author of Christianity and the Founder of Islam. It would have been better for his argument if he could have abstained from the insinuation that the non-employment of force, perhaps from want of opportunity to use it, "has been looked upon as establish-

* *A Critical Examination of the Life and Teachings of Mohammed.* By Syed Ameer Ali, Moulvi, M.A., LL.B., of the Inner Temple, Barrister-at-Law. London: Williams & Norgate. 1873.

ing the divinity of the noble Prophet of Nazareth." But at least there is no mincing of matters when we are told that Mahomet had a mission to fulfil, and that he was not "obliged to sacrifice himself and the whole community over which he was called to preside, for the sake of carrying out what, in the present time, would be called an idea." The main fact is the declaration of Mahomet that he, the last of the prophets, was sent with the sword. Mr. Ameer Ali's comment is that the circumstances in which Mahomet, with his little knot of followers, found himself, made the use of force a question of self-preservation, and that all subsequent Moslem conquests were simply punishments for unprovoked aggression. With the latter assertion, which in its wide sweep justifies the career of Amr and of Taric, we are not here concerned. Even less can be said for the professors of Christianity than for the followers of the Arabian prophet. The atrocities of inquisitors in Provence, the iniquitous laws passed to defend the Reformation or the Established Church in England, fully surpass anything done at any time by propagators of Islam.

The real point at issue in this matter is the divine sanction which Mahomet claimed for acting as a leader of armies not less than as their teacher; and this point may best be tested by his precepts and acts on the subject of marriage. Unhappily, the two cannot be taken separately; but on both we may form, and are bound to form, a judgment without reference to practices prevalent from time immemorial, whether in Arabia or elsewhere. It is unnecessary to discuss the origin of polygamy, or the benefits which under certain conditions it has been supposed to confer; but it is difficult, if not impossible, to believe that the numerical inequality of the sexes originated the evil. Left to the working of natural causes alone, that inequality is the same in all ages. If we choose to speak of the further inequality caused by war, slavery, or infanticide, we are really altering the terms of the question. Still more puzzling is it to be told that in the generality of cases it is "sheer necessity which drives people to polygamy in the East" (p. 237). The words seem to apply to men and women alike; and in this case poverty in hot climates has an effect as wonderful as that which, according to Sam Weller, it produced on the inhabitants of Whitechapel. But if the words are meant to apply to the women only, it becomes a mere matter of statistics to ascertain whether, and how far, the women sent into the harems of polygamists are the daughters of beggars. All this, however, is for the present beside the mark. Unquestionably Mahomet found polygamy not merely in existence, but generally prevalent; and the position of Mr. Ameer Ali is that he

struck at the root of the evil . . . by limiting the maximum number of contemporaneous marriages; by giving rights and privileges to the wives as against their husbands; by making absolute equity towards all obligatory on the man; by guarding against their being thrown helpless on the world at the wilful caprice of licentious individuals.

At the least we may give Mahomet credit for doing something towards modifying the evil; but in his own practice he far exceeded the maximum. Even here his advocate is not at a loss. "A dispassionate examination of facts, a thorough analysis of motives from the standpoint of humanity will," he urges, "show us the extreme want of candour, fairness, and simple charity on the part of the writers" who cast the marriages of Mahomet in his teeth. The defence resolves itself mainly into the assertion that these marriages were almost all mere acts of kindness, which he would much rather not have performed if he could have helped it. Twenty-five years of age at the time of his first marriage, he had for twenty-five years longer but one wife in Kadijah; after her death he married Sauda, the widow of one of his earliest followers, whom persecution had driven to Abyssinia, where he died. His widow was destitute; what could the Prophet do but marry her? He married Ayesha while she was yet a child; but this was only at the earnest desire of her father Abu-bekr, who thus wished to testify his gratitude to the teacher "who had led him out from the darkness of scepticism." His next wife, Hafsa, the only daughter of Omar, he married merely because neither Abu-bekr nor Othmar would have her, and because Omar, on learning their refusal, flew into a rage, which threatened nothing less than a civil war. Three other women he married from the impulse of pure charity, because they were widows whom their kinsfolk either would not or could not support. Then follows the story of the wife of his freedman Zaid; and here also a justification is not wanting. The marriage was an unhappy one. The high-born lady could not bear the idea of consorting with a manumitted slave; and she greedily availed herself of a weapon with which an accidental utterance of the Prophet had furnished her. "He had occasion," says Mr. Ameer Ali, "to visit the house of Zaid, and upon seeing Zaynab's unveiled face, had exclaimed, as a Moslem would say at the present day when admiring a beautiful picture or statue, 'Praise be to God, the ruler of hearts!'" These words Zaynab so often repeated that the patience of Zaid at last gave way, and, resolving to be rid of her, he went to Mahomet and said that he was going to divorce her. Mahomet was grieved at this result of a marriage which he had himself brought about; but his efforts to change Zaid's determination were vain. Zaynab was divorced, and sent a message to Mahomet to say that she looked to him for support. "Under these circumstances Mohammed married her."

This is all that Mr. Ameer Ali says of this matter; but the real offence lies elsewhere. Sir William Muir has also told the story, and has necessarily told it without the wish to shelter Mahomet which animates Mr. Ameer Ali. Mahomet not only took Zaynab after making some one in the presence of Ayesha

to go and tell her that the Lord had joined her to him in marriage; he added a Sura to the Koran, representing God as rebuking him for his hesitation and for fearing men rather than God:—

When Zaid had fulfilled her divorce, W. F. joined thee in marriage unto her, that there might be no offence chargeable on believers in marrying the wives of their adopted sons, when they have fulfilled their divorce; and the command of God is to be fulfilled.

In short, he made use of his prophetic office as an instrument for carrying out his own plans and furthering his own wishes or pleasures; and one alternative only remains. Either he looked on his wishes and plans as being perfect—and in this case he was a presumptuous fanatic; or he did not, and thus far he was a conscious deceiver. Sir W. Muir is assuredly fully justified in putting down this Sura as a piece of "impious effrontery," and in adding the remarks which he makes on the subject. "Our only matter of wonder," he insists,

is that the Revelations of Mahomet continued after this to be regarded by his people as inspired communications from the Almighty, when they were so palpably formed to secure his own objects and power even to his evil desires. We hear of no doubts or questioning; and we can only attribute the confident and credulous spirit of his followers to the absolute ascendancy of his powerful mind over all who came within its influence.

Of his other marriages we need not speak. Of his concubinage Mr. Ameer Ali seems to take no notice; yet the affair of Mary the Coptic maid is one with which an advocate surely ought to deal. We may turn to another phase of his character, in reference to which Sir W. Muir says emphatically that "the daglarding assassination of political and religious opponents, countenanced and frequently directed as they were in all their cruel and perfidious details by Mahomet himself, leaves a dark and indelible blot upon his character." It is unfortunately not difficult to give specious names to sins and crimes; and on the champions of a religion the temptation to palliate or veil offences must always exercise a terrible force. The greater is the credit due to Mr. Ameer Ali for the firmness with which he has generally resisted it; but we, who look on Mahomet from a point beyond the circle of his influence, may fairly say that there are some dark blots which he has failed to hide, and which will not be washed away. We may appreciate fully the benefits which on the whole Islam has conferred upon the Eastern world; but we dare not shut our eyes to the flaws which are manifest whether in the man or in his work.

TULLOCH'S RATIONAL THEOLOGY IN ENGLAND.*

PRINCIPAL TULLOCH'S fresh and most instructive volumes may be regarded as specimens of biography directed to a purpose; and although we shall not agree with one of his reviewers in pronouncing the biographical parts to be the cream of his book, we may well bear testimony to the charm of the two or three upon which he has bestowed most pains, pre-eminently that of one whose posthumous works appeared under the title of the *Golden Remains of the Ever-memorable Mr. John Hales of Eton College* (1659), yet who is now scarcely remembered at all, save in the praises of his younger contemporaries. Dr. Tulloch's spirit and design in this considerable production of his active pen (which is inscribed to Dean Stanley), may best be described in the following extract from his vigorous preface:—

Deeply interested in the principles expounded in these volumes, and the writers who first advocated them in England, I have had sincere pleasure in endeavouring to do some measure of justice to both the one and the other. I have felt this pleasure all the more that some of these writers have hitherto received scanty acknowledgment. It is something of a misfortune for religion and the history of the Church, that the men who secure most attention in their own day, and afterwards, are by no means those distinguished for Christian moderation. Violent and picturesque characters, the fervid and zealous missionary, the eloquent fanatic, the dogmatic and denunciatory theologian, are all apt by their prominence to throw men of quiet thoughtfulness and tempered and rational enthusiasm into the shade. Churchmen like Hales and Whichcote are forgotten, while the noisy champions of extremes are remembered and live in the historic page. I have derived so much pleasure from the repeated study of Hales and Chillingworth, and again of Whichcote and his Cambridge contemporaries, and cherish so warm an admiration of their great gifts of Christian reasonableness, that I should rejoice if I have done anything to restore the images of men who appear to me the very best types of the English theologian—manly and fearless in intellect, while reverent and cautious in spirit.

"Christian reasonableness," or, as he elsewhere defines it, "the slow elaboration of the Christian Reason, looking before and after, gathering into its ample thoughtfulness the experiences of the past, as well as the eager aspirations of the present"—in short, the religion of the head, rather than of the heart or the imagination—is the special quality which attracts our author's sympathy towards men some of whom had little else in common, except that they lived in the same century and were all members of the same communion. The "Liberal Churchmen," as the Principal calls them in his modern parlance, thus commemorated in his first volume, are Lucius Cary, Lord Falkland (1610-43), John Hales (1584-1656), William Chillingworth (1602-44), Jeremy Taylor (1613-67), and Edward Stillingfleet (1635-99). We must

* *Rational Theology and Christian Philosophy in England in the Seventeenth Century.* By John Tulloch, D.D., Principal of St. Mary's College, in the University of St. Andrew's, one of Her Majesty's Chaplains for Scotland. Author of "Leaders of the Reformation," and "English Puritanism and its Leaders," a vols. Vol. I. Liberal Churchmen. Vol. II. The Cambridge Platonists. Edinburgh and London: William Blackwood & Sons. 1872.

confess to have felt at first a little surprised that our English Chrysostom should have found admission into so select a company; impassioned and moving eloquence is the characteristic feature of Bishop Taylor's writings, rather than the faculty of calm, sustained, and cogent reasoning. The argument is that both he and Stillingfleet hold their place there in spite of the general tenor of their minds and the dominant temper of their publications, as standing in a peculiar relation to the history of religious thought in this country:—

They belong to the liberal movement of the seventeenth century, in so far as they contributed by distinct and important works to its advancement; yet neither their special reputation, nor the prevailing character of their theological activity, has identified them with it. Jeremy Taylor's *Liberty of Prophesying* [1647] is among the most remarkable works of the century. Stillingfleet's *Irenicum* [1659] is of less significance, because less distinguished by genius and interest, and in our day it is comparatively forgotten. Yet it, too, claims to be remembered as marking the height to which the wave of liberal Churchmanship had risen before the reaction which set in with the Restoration.—Vol. I., p. 315.

The *Irenicum* would naturally be viewed with special indulgence by an eminent member of the Scotch Establishment like our author, inasmuch as its main object was to lay the foundation of a "Comprehensive Church," large enough to receive into its fold Episcopalian and Presbyterian alike; it is a clever and honest, if not a very successful, attempt to demonstrate that in primitive times diversities in Church government were regarded as insufficient to justify a severance of communion. The results of the Savoy Conference seem to have directed Stillingfleet's thoughts and studies into other channels; nor was he much disposed to argue against the essential need of the order of bishops, when himself seated on the throne of Worcester. "He was a great man in many respects," said Burnet long afterwards, in his quaint manner; "he knew the world well, and was esteemed a very wise man. The writing of his *Irenicum* was a great snare to him; for, to avoid the imputations which that brought upon him, he not only retracted the book, but he went into the humours of a high sort of people, beyond what became him, perhaps beyond his own sense of things." This perhaps is hard measure; but it is characteristic. He became distinguished as a defender of the faith against unbelievers; he was celebrated as an ecclesiastical antiquary; even in his final controversy with Locke he held his own better than some of that philosopher's votaries would have us believe; but his subsequent labours, "clever, able, and eminently successful in their day . . . [yet] lack the vital interest which alone some spark of nature, some fire of passion, or some glow of meditative or speculative genius, can give to theological polemics" (vol. i. 416), as well as to polemics not theological.

Passing by the honoured name of Falkland, which serves chiefly as a *πρόσπων ἐμπρόσπον* to the goodly building which Principal Tulloch has raised for our delectation, the model examples of "Liberal Churchmen" at that period were doubtless that pair of intellectual giants, John Hales and William Chillingworth. Their fortunes had this much in common, that they were both of them first honoured with, then ruined by, the friendship and patronage of Archbishop Laud, whose soul was not so narrow but that conspicuous merit, wheresoever found, had power to win his help and countenance; yet neither of them could have given a whole heart to the Royal cause, for the sake of which the elder of the two spent his last years in the deepest poverty, and the younger died only not a martyr. When they are compared together, to Hales must be adjudged the palm for erudition—"The Walking Library" was the appellation by which he was familiarly known. Chillingworth has perhaps no match in all literature for close and subtle reasoning; only that we are almost tempted to distrust that remorseless logic which first beguiled its master against his will into the bosom of the Church of Rome, and then forced him, possibly with less reluctance, *refrorum mala dare, atque iterare cursus*. It has always seemed to us that his grand treatise "The Bible, the Religion of Protestants," fails utterly as a constructive work; its destructive power cannot be exaggerated; as an engine of assault it is simply terrible. But the reader who thirsts for truth would fain learn something better than that what others hold is not the truth, and would have been at times right glad if his own champion's campaign had been less brilliant.

We cannot help returning for a moment to the Principal's Life of Hales, for whose genius, disposition, and pursuits he has a scholar's admiration and brotherly sympathy. Few representations can be more touching than the good man's disgust at "the brawls grown from religion," which his presence as a hearer at the miserable Synod of Dort in 1618 tended powerfully to foster; few protestations can be more pathetic than that which he poured into the ears of his patron Laud, whom he saw disposed to resent certain notions broached in his yet unpublished tract on "Schism":—

The pursuit of truth [Hales writes] hath been my only care ever since I first understood the meaning of the word. For this I have forsaken all hopes, all friends, all desires, which might bias me, and hinder me from driving right at what I aimed. For this I have spent my money, my means, my youth, my age, all I have, that I might remove from myself that censure of Tertullian—*Suo vitio quis quid ignorat?* If, with all this cost and pains, my purchase is but error, I may safely say, to err hath cost me more than it hath many to find the truth, and truth itself shall give me this testimony at last, that if I have missed of her, it is not my fault, but my misfortune.—Vol. I. p. 23.

The enemies of Laud's memory ought to be told that he replied to this noble remonstrance by procuring for its author a canonry of Windsor. It may not be true of the Archbishop that "fatal

learning led him to the block," but the love of it undoubtedly consoled and dignified his troubled life.

The second volume of this work, which introduces us to the Cambridge school of Platonists, will hardly be so popular as the first with general readers, but it overflows with new matter, and will repay even more abundantly the pains of an earnest student. Dr. Tulloch selects as his subjects men once deservedly esteemed, although the fame of scarcely more than one of them has survived the waste of two centuries. They are Benjamin Whichcote (1610-1683), of Emmanuel, who, in spite of the moderation of his opinions, suffered himself to be intruded into the Provostship of King's during the Great Rebellion (1644-60); John Smith (1618-52), also of Emmanuel, "in some respects the most remarkable of the Cambridge school—the richest and most beautiful mind, and certainly by far the best writer of them all"; Ralph Cudworth (1617-88), again an alumnus of Emmanuel, in reputation the Coryphæus of the company, intruded as Master into Clare Hall by the Parliamentary Visitors, as Whichcote had been into King's, from no identity of feeling with the party in power, but because the fact of their having been bred in the Puritan College "seems to have formed a sufficient passport to promotion in the eyes of Parliament"; Henry More (1614-87), of Christ's, the most voluminous and fanciful, but least readable, of them all. A few lesser lights are briefly glanced at in a chapter by themselves, as Nathaniel Culverwel, a Puritan indeed worthy of Emmanuel College, the Master of which, Anthony Tuckney, gave one proof at any rate of his practical good sense when, in reply to an exhortation that in elections to Fellowships he would have regard to the godly, he declared his determination to choose none but scholars, "adding very wisely, They may deceive me in their godliness, they cannot in their scholarship." At the tail of the list come two Oxford men, of whom Joseph Glanvill (1636-80) is best known by a defence of witchcraft, which in its posthumous form bears the title of *Sadducismus Triumphatus*. But, in truth, the catalogue is a melancholy one. It is enough to damp the spirit of any ardent young student who may pant for the praise of posterity to contemplate a whole busy school of intellectual thought, composed of men who formerly were the pride and righteous boast of one of our great Universities, but who are as much forgotten, save by a very few of those who now fill the self-same places, as though they had never been.

Cudworth, by this time become Professor of Hebrew, who in 1654 had been promoted from the Mastership of Clare Hall to that of Christ's College, was in this respect more fortunate than Whichcote, for he retained that post and the Professorship of Hebrew after the Restoration. His new college was then basking in its brightest sunshine, for Joseph Mede and Henry More were among its Fellows, and Milton had left it only some twenty years before. In this enviable station he composed the work by which he, and indeed the Cambridge school, are best known, the *True Intellectual System of the Universe*. This "immense fragment," as Dr. Tulloch calls it, extended in the original folio edition (1678) to about nine hundred pages, yet comprises only the first book or part of his projected task. It seems to have been suggested, and was largely affected, by Hobbes's able and insidious *Leviathan* (1651), wherein, under a feigned show of reverence for Christianity and good government, the very foundations of religion and morality are sapped, and no better substitute is put in their room than the iron despotism of irresponsible civil power. Since Cudworth's volume, though well known by name, and often cited in philosophical discussions, is far less read than it should be, our author supplies us with an excellent summary of its contents and general spirit, more full and satisfactory than that given by Hallam in his *Introduction to the Literature of Europe*, and on the whole more favourable. While regretting that "the massive build of thought is unrelieved by any graces of style or felicities of expression," and lamenting the frequency of digressions which increase the bulk of the treatise, while they even impair the force of its arguments, he yet pronounces that, "taken as a whole, it is a marvellous magazine of thought and learning, and remains one of the most undoubted monuments of the philosophical and theological genius of the seventeenth century." The subject which he handled so well goes to the very root of all knowledge and all truth, being no less than the settling forth of such proofs as our natural reason can afford us of the existence and personality of a Supreme Being. Cudworth saw as distinctly as those who are bearing their part in the same great controversy at present, that the whole question resolves itself ultimately into this—whether mind or matter be the sovereign of the universe; whether mind originates and controls every motion and combination of inert matter, or be itself but a function and property of such matter. It is not logically impossible for the most rigid advocate of materialism to be a Theist; whosoever believes in the independent existence of mind cannot be otherwise. We subjoin the final paragraphs of the Principal's review, though we do not sympathize with the cheerless tone of his concluding sentence:—

These are the questions which Cudworth pondered; they are those which our age still ponders. If he cannot be said to have solved them, he yet steadily and rationally faced them. He has shown—no one has ever shown better—how we cannot work from below upwards; and that if we begin with matter and a philosophy of sense, we can never reach conscience and a philosophy of reason. He has exhibited the co-ordination of the different planes of thought [a favourite metaphor with Dr. Tulloch], and made it clear how we must stand on the one side or the other. It is not possible perhaps to do more, or to fathom the depths of that dualism that meets us everywhere in the last stages of our inquiry.

If we learn nothing further from Cudworth, we will learn strength,

patience, and candour in conducting so great an argument. His form of exposition may be antiquated, but his spirit and reason will never grow old. And if we do not come in his pages nearer to that certainty which some minds are destined never to reach in this world of endless interrogation, we may be helped to trust where we cannot know, to tolerate those who differ from us, and to welcome light and truth from whatever quarter it may come.—Vol. II. p. 302.

We have said of Henry More that his writings are the most voluminous and unreadable of any of his school. "They never became literature" is our author's verdict. We must add in fairness that the man himself was the most genial, natural, and perfect of them all. "We get nearer to him than any of them," says Dr. Tulloch, "and we can read more intimately his temper, character, and manners—the lofty and severe beauty of his personality—one of the most exquisite and charming portraits which the whole history of religion and philosophy presents." In these respects the Fellow of Christ's (his contented soul never craved for higher preferment) was a pleasing contrast to the Master, whose disposition seems to have been a little jealous and exacting. Yet in solidity of sense and judgment More's was conspicuously the inferior intellect. Tormented for some years in youth by sceptical doubts, he afterwards became fascinated by the mystic writers, and even grew enamoured of the transcendental nonsense of the Cabbala. In this vein he took to writing verses; but though "there are here and there not a few gleams of poetic and spiritual insight, apart from the notes and interpretation general, which he has himself happily furnished, they are barely intelligible." One of his lady pupils, a sister of Lord Chancellor Nottingham, and afterwards wife of Lord Conway, contributed as much to the refinement of his mind as he did to the strengthening of hers. She ultimately caused him much grief by falling under the influence of the Quietists or Quakers. It was a peculiarity of this whole school that its teachers cherished a belief in supernatural apparitions. Even Oudworth alleges them as a direct confutation of Atheism, and a proof of the reality of the world of ghosts; but More and Glanville had carried their credulity into particulars, as *Saducismus Triumphatus*, which was virtually their joint production, too plainly demonstrates. Yet even here the Principal does well to remind us that "we may also recall the phenomena of what is called spiritualism in our day before condemning too loudly the absurdities of such men." Some of their stories are singularly like those now or lately soliciting scientific investigation. Their "spirit-thumping on the bench" must have been very much the same as our table-rapping. So strangely in very different ages do the follies of the wise repeat themselves.

And here we must take our respectful leave of this large-minded, lively, and thoughtful work, which deserves to the full the acceptance it cannot fail to receive. We note here and there a little ruggedness or carelessness of style, and the way in which Greek words and passages in the notes are printed and accentuated is not creditable to the printer. Admiring and thankful for these volumes as a whole, we shall not be thought to hold ourselves responsible for every incidental opinion expressed in them. Especially would we enter our protest against that gratuitous and unreasonable prejudice which persuades the author to disparage Oudworth's prophetic investigations, and to marvel that such a barren line of study as an inquiry into the chronology of Daniel's seventy weeks should have had charms, not for a Hebrew Professor only (for that were a pardonable weakness), but for laymen like Newton and Locke. We cannot conceive any possible theory of inspiration on which exact researches into the literal meaning of Scripture should be misplaced; and if their result should haply prove what those great philosophers believed or hoped, the inference to be drawn from such a fact would surely neither appear futile to, nor be regarded as unwelcome by, "One of Her Majesty's Chaplains for Scotland."

A SEASIDE EXCURSION IN ANCIENT INDIA.*

AN essay in the *Journal of the Asiatic Society of Bengal* comes opportunely at this season when half London is either at the seaside or is meditating a journey thither. It shows us how the ancient Hindus disported themselves at their watering-places more than two thousand years ago, and how they enjoyed their day's excursion to the sea with all the zest and more than the boisterous hilarity which attends the outings of our modern citizens. This very curious picture of ancient manners has been fished out of the ponderous volumes of the "Mahā-bhārata," a Sanskrit poem containing more than a hundred thousand couplets, compiled some centuries, how many it is difficult to say, before the beginning of the Christian era. We are indebted for it to Bābū Rājendra Lal of Calcutta, a learned Hindu deeply versed in the ancient language and literature of his country, who writes English in a style which might put many a well-to-do Englishman to the blush.

The scene of this excursion, or picnic, as the Bābū calls it, was Pīndāraka, a small watering-place on the coast of Guzerat, near Dwāraka, the "city of gates," a place of great renown as the capital of the god Krishna, the most celebrated and popular of the many incarnations of Vishnu. The place itself is described as a *dhāra*, or holy bathing place; but as the Bābū observes, "the trip was one of pleasure and had nothing religious about it." Krishna himself, some of the half-deified heroes of the poem, and a celebrated sage named Nārada, whose writings even yet retain their authority, are represented as leading

members of the party. But although the poet revels in describing the godlike powers of Krishna, that hero and his companions are all of the earth earthy, and enjoy themselves in bathing and sports, eating and drinking like ordinary mortals. They are but characters in a picture drawn by the poet from real life, exaggerated by a love of the marvellous, but acting parts in scenes similar to what he had actually beheld. So, putting aside all that is superhuman, the rest may be taken as only an overdrawn picture or extravagant description and amalgamation of scenes that might have been witnessed at watering-places in those ancient days.

Krishna, having determined to visit the seaside, placed his capital in charge of some friends, and set out, accompanied by his family—rather a numerous one, for his sixteen thousand wives are represented as being present; but we will assume this to have been in the spirit, not in the flesh. With him went in separate parties

the wise Balarāma, the lord of regions Janārdana, and other princes of god-like glory. Along with them went thousands of courtesans, dealers in their beauty, captive women who had been originally introduced into the city by the Judavas, and had been kept there by Krishna to prevent unseemly brawls, which at one time used to take place on account of women. Balarāma went out with his only affectionate wife Kevati, for whom the glorious chief entertained the most devoted affection. Adorned with garlands of wild flowers and jubilant with draughts of wine, he disported with her in the ocean waters.

It seems to have been the fashion for husbands to dance, sing, and sport with their wives, but the constancy of Balarāma to his only wife is dwelt upon as something commendable, though unusual. No mention is made of maidens; married women and courtesans alone are named, and these mixed together without any restraint, the courtesans enjoying a familiarity with the married ladies which appears almost incredible. Evidently immorality among the Hindus in those old days had sunk to a lower depth than it has yet reached in modern times. The *demi-monde* may be envied for its luxury, its dress and manners may be imitated in fashionable life, it may be spoken of and looked upon with only simulated disdain, but still it finds one barrier which it has not yet broken down, though even this shows signs of weakness. We will now see how the holiday-makers enjoyed themselves in the water:—

Krishna of the lotus eyes entertained himself in many forms with his sixteen thousand wives. . . . and they standing ankle-deep or knee-deep or breast-deep, each according to her choice, in great glee threw water upon him, even as the heaven pours on the sea; and Krishna, in his turn, showered water on the ladies, as gentle clouds drizzle on flowering creepers. . . . Others swam about supported on floats of various forms, some shaped like cranes, others like peacocks, others like serpents, or dolphins, or fish. Some, resting on their breasts like pitchers, swam about in great joy. . . . Gazelle-eyed damsels sported in the water with very thin raiment on their persons. . . . The accomplished and heroic princes, in a separate company, entertained themselves in the waters with the damsels that had come with them, and who were proficient in dancing and singing. Though these women had been forcibly torn away from their homes, they had been overcome by the suavity of the princes, and these, in their turn, were delighted with the singing and acting of these charming creatures.

The bathing being over, dancing and singing followed. Celestial damsels went through their performances to the delight of the eyes and ears of the beholders, for "by their sidelong glances, their hints and smiles, their assumed arrogance, and mirth, and complaisance, they completely charmed the spectators." Nor were creature comforts wanting. "Of eatables and drinkables, of things to be chewed, swallowed, sucked, or licked, there was nothing wanting, and whatever was desired was immediately forthcoming." But this was a mere refectory; the grand feast was to be served at a later hour. Next came dramatic and operatic performances, representing passages in the lives of the gods and heroes. "These and other most delightful subjects were enacted and sung by beautiful women." The pleasure-seekers then engaged in dancing among themselves. "Balarāma, the Majestic, inflamed by plentiful libations of wine, danced in joy with his wife, sweetly beating regular time with his own hands." In his appearance and dress he is described as "covered with sandal paste, with eyes glowing crimson under the influence of wine, and with unsteady steps, paying his attention solely to his spouse. Dressed in two pieces of sky-blue cloth, bright-complexioned as the moon, and languishing-eyed, he appeared charming like the moon partially hidden under a cloud. With a beautiful earring in the left ear, and a pretty lotus on the other, he looked upon the smiling face and arch glances of his love." Such, we must suppose, was the style in vogue among the exquisites of the age. Krishna himself and the leading members of the party all joined in the dance with such eagerness and spirit that "the creation smiled in joy." Now appeared "the Brahman sage Nārada, the revered of the gods, dancing with his matted locks all disheveled. He became the central figure in the scene, and danced with many a gesticulation and contortion. By mimicking the action of some, the smile of others, the demeanour of a third set, and by other similar means he set all a laughing who had hitherto preserved their gravity. For the amusement of Krishna, he mimicked the smallest little word of his, and he screamed and laughed so loudly and repeatedly that none could restrain themselves, and tears came to their eyes." If such was the behaviour of a hoary sage, supposed to be dead to the pleasures of the world, what was to be expected of mere ordinary mortals? But of a truth these old Hindu philosophers and lawgivers were many of them very far from being the saints and ascetics they have been described. Some of them appear in the dramas and poems with very worldly and carnal affections, and the oldest extant treatise on the *art amatoria* was the production of a sage

* A Picnic in Ancient India. By Bābū Rājendra Lal Mitra. *Journal of the Asiatic Society of Bengal*, Vol. XII.

whose ordinances are only inferior in authority to the Vedas themselves.

This morning performance, as we may call it, being ended—

Krishna took by the hand the venerable sage Narada of imperturbable mind, and coming to the sea-water along with his wife and his followers, said, "Let us enter the delightful water with the ladies in two parties. Let Balarāma with his wife be the leader of one party consisting of my children and half of the company, and let the other half of the company and the children of Bala be on my side in the sea-water." Krishna's wife incited by a wink from him began to throw water on Narada. Balarāma tottering with drink, with great glee fell into the water, and beckoning his wife, the charming daughter of Revata to his side, he took her by the hand. Then the sons of Krishna and those who belonged to the party of Balarāma, joyous and bent on pleasure, unmindful of their dresses and ornaments, and excited by drink, followed him into the sea. Krishna and Narada, with all those who were on their side, began to splash water on Bala and his party; and they returned it on Krishna and his supporters. The wives of Balarāma and Krishna, excited with arrack, followed their example, and with great glee squirted water from syringes. Some of the ladies, over-weighted with the load of love and wine, with crimson eyes and masculine garments, entertained themselves before the other ladies with squirting water. Seeing that the fun was getting fast and furious, Krishna desired them to restrain themselves within bounds.

The aquatic diversions were ended, but the day's enjoyments were not yet brought to a close. The grand feast was to follow. All repaired, by order of Krishna, "to the banqueting hall, and there, taking their seats according to their respective ranks, ages, and relationship, they cheerfully commenced the work of eating and drinking." The bill of fare is given—a very long and curious one. In it we find large joints of meat roasted on spits, various curries of meat, sauces made of tamarinds and pomegranates, young buffaloes roasted and basted with butter, buffalo meat fried in butter and seasoned with acids and salt, and "branches of venison boiled in different ways with sorrel and mangoes, and sprinkled over with condiments." As relishes and seasonings they had sweet basil, ginger, asafetida, and a variety of herbs. Of wines, or rather spirits, there was abundance, consisting of liquors prepared by the distillation or fermentation of flowers and other vegetable productions. Nor were whets and zests wanting to incite thirst and give a relish to the potations. The pastry and sweetmeats we must pass over. But amid this riotous feasting there were some who restricted themselves to more humble fare, "respected heroes who did not drink, but heartily feasted on vegetables and fruits, broths, curds and milk, drinking sherbets of divers kinds and milk boiled with sugar." Having thus got through the day, they proceeded to make a night of it. "The gallant chiefs, seated with their ladies, began to sing such choice delightful songs as were agreeable to them." The sage Narada took up his "rāmā" of six octaves and exhibited his musical accomplishments. Krishna himself beat time with the cymbals; another chief lent his aid with the flute, and all who were able joined in with their respective instruments. An accomplished actress then "delighted them with her acting and her exquisitely slender figure." Other songs and dramatic representations followed, till at last they came to the grand concluding piece of music, "which was sung in six octaves and in various modes." Young and old all joined in the song, which was repeated by different parties of singers and cheered over and over again. When at last it was ended, "Krishna rewarded the dancing girls and heavenly actresses, and the company broke up."

Such were the bhochanaliya caries in which the gentle Hindu indulged in ancient days, overdrawn and exaggerated, as we have said, by the imagination of the poet, but still having a broad basis of fact in the manners and customs of the times. All is not as it should be in modern India; morality is at a low ebb, and religion is corrupt and wildly superstitious; but, had a society may be, it is at any rate better than it was in days when godlike heroes and saintly sages and lawgivers trod the earth.

CHRONICLES OF ST. ALBANS.*

WHEN we reviewed the ninth volume of the Chronicles of St. Albans (September 23, 1871) we took advantage of the absence of matter of historical interest to criticize the text as produced by Mr. Riley. We observed that there were several instances in which he had failed to copy from the MS. correctly, and others in which he had missed the proper interpretation of it. There was one case in which we accused him of failing to interpret a word concerning which we hazarded a conjecture which we have now to retract. In the lines

Mitra sacra cunctum, vel dedicat annulus hircum—
Hec lupus agnoscit, heu vulpes præcedit amicis,

we ventured to suggest that the word written *amicis*, which must of necessity mean *goats*, was a mistake of the writer's; but a correspondent has reminded us that *amicis* must have been the reading which Mr. Riley found in the MS. and ought to have printed, the word *auca* being commonly used in post-classical times for a *goat*.

In the present volume, which is the tenth of the series, there are not nearly so many mistakes of this kind, yet there are frequent

indications of Mr. Riley's weak point, which is want of scholarship. We must not dwell long upon the execution of the work, because the contents are so interesting that they will demand all the space we can give to them. We shall only remark, therefore, that though misprints are not so common, as far as we have observed, in this volume as in those previously issued, yet it contains more errors than such a handsomely printed volume ought to present; by no means all of them having been noticed on the page of *Corrigenda*, which contains the very modest and allowable number of eleven *errata*. And as regards the editor's own suggestions, they seem to us in some cases to be most unfortunate. Thus, to give but one or two instances, at p. 153 Mr. Riley has inserted the word *utramque* as a conjectural emendation of a passage where two documents, written in Latin, are said to have been briefly and clearly explained to the unlearned. After mentioning the *carta regis* and the *bullæ Sanctissimi Patris*, the writer continues:—

Quarum vir alter discretioris et morum gravitate pollens, Vicarius Generalis Domini Episcopi memorati, vulgari eloquio succincte ac periculo omnibus explicavit.

We should have thought there could have been no reasonable doubt that *senum* is the word omitted after *quarum*, and not *utramque*. Soon afterwards, in the description of the Duke of York taking the oath of future obedience to the King, in the expression *quod de ceteri sic peccare non audiret* Mr. Riley has mistaken the last word, which is very common in mediæval Latin, and not unknown in classical times, as a substitute for *adjuveret*, and altered it into *adjuveret*, which is entirely unconstruable. Again, the editor has occasionally missed the meaning of his author, as, for instance, in the marginal analysis at p. 375, where the insurgent nobles are represented as "taking the sacrament" before they escort the King to London. The expression *inmolato tamen prius Domino Deo sacrificio laudis* merely implies that they were present at mass. As regards the proper method of representing the readings of the MS., the editor, apparently alluding to past criticisms on this point and deprecating further reference to it, quotes the Directions given for the Guidance of Editors in defence of the line which he has adopted; but he has neither succeeded in all cases in placing the Latin text before the reader in the ordinary classical manner, nor does he appear in all instances to know which is the mediæval and which the classical form. He might, for instance, have left *exillum*, and not invented the unheard of and improbable form, *exillum*; and the *pulchritudo* of the MS. might have been allowed to stand instead of what has hitherto been wrongly supposed to be the more classical mode of spelling—namely, *pulchritudo*. Again, what are we to think of the word *impissimus* at p. 288, and *corroberant* at p. 337, printed without attention being called to the anomaly? Or again, are *relaxamen*, p. 351, and *altissima*, at p. 407, classical modes of spelling? The truth is, we are frequently at a loss whether to attribute the blame to Mr. Riley or to the corrector of the press. And, on the whole, we see no reason to change the opinion we have often expressed in reviewing the volumes of this series, that such words as *dampnum*, *sollenpissus*, and the like, the spelling of which is uniformly the same in mediæval Latin of the period of these volumes, ought to be printed exactly as they are in the MS., no variation being adopted, except where the reading is a manifest slip of the pen of the scribe.

We now turn to the contents of the volume, which gives us the continuous history of ten years of the second period during which Whethamstede was Abbot of St. Albans, and which undoubtedly by its manifold points of interest amply atones for the meagreness which we complained of in our review of the ninth volume. It treats of the period from A.D. 1452 to A.D. 1461, the last ten years of the reign of Henry VI. Mr. Riley's introduction is confined to the single question of the authorship of the work. His title-page speaks of the book having been attributed to Robert Blakeney, who at some time or other was chaplain to Thomas Lantardge, Abbot of St. Albans from 1492 to 1522, and who wrote his name and designation on the flyleaf. Mr. Riley thinks there is ground for belief that it was written earlier than the year 1476, and inclines to the opinion that it was compiled by some unknown hand from various sources and put together shortly after the death of Abbot Whethamstede, which took place in January 1465. The object of writing, he thinks, was to disqualify William Walsingham, the Prior of the Abbey, from succeeding, as he afterwards did in 1476, to the Abbot's place. We have no time to follow the investigation here. We will only say that Mr. Riley makes out a very good case for his theory, and undoubtedly completely disproves the notion of its being the work of Whethamstede himself.

Of the first two years of the second abbacy of Thomas Whethamstede we have nothing to say. All the details respect the peculiar circumstances of the Abbey, and have little or nothing to do with the political history of this period; but the scene changes in the fourth year, when the first battle of St. Albans introduces us to the history of the Wars of the White and the Red Roses. This, which it is almost needless to say is far the most interesting part of the Register, has been printed before by Hearne, and is indeed one of the principal authorities for the history of the reign of Henry VI., which is somewhat meagre in original documents. The battle itself, which took place May 22, is evidently described by an eye-witness, who pictures the principal street of the town as filled with the mutilated bodies of the combatants, and who is glad to be able to fill up his descriptions with passages quoted from classical poetry, or feeble imitations of heroic and elegiac verse.

* *Chronicon Monasterii S. Albani. Registra quorundam Abbatum Monasterii S. Albani, qui seculo XVmo. floruerunt. Vol. I.—Registrum Abbatum Johannis Whethamstede, Abbatum Monasterii Sancti Albani, iterum susceptum; Roberti Blakeney, Capellani, quondam abbatum.* Edited by Henry Thomas Riley, M.A. Cambridge and Oxford, and of the Inner Temple, Barrister-at-Law. Published by the Authority of the Lords Commissioners of Her Majesty's Treasury, under the Direction of the Master of the Rolls. London: Longmans & Co. 1872.

which are the compositions of his own brain. And here again we light upon another indication of want of scholarship. Surely it would have been easy to make something out of the following:—"et clypeus clypeo et umbone repellatur umbo, esse minax ensis, podo pes, et cuspidis cuspis." The alteration of *esse* into *cuse* would have made the lines construable; to say nothing of the editor apparently never suspecting that his author was quoting a couplet of hexameter verses. But this by the way. The battle is made the pretext for going back twenty years in the history to trace the origin of the dispute to the time when, after the death of the King's uncle, the Duke of Bedford, in 1435, the government of Normandy had been committed to Richard Duke of York for the space of five years; after which followed the cancelling of the renewal of the appointment for another five years at the instigation of Somerset, who, with the help of Suffolk, persuaded the King to substitute him for the Duke of York. The writer apparently sympathizes with the King, and lays stress on the vindictive character of Richard, and the suppression of his hatred for Somerset till the time when his being made Protector of the realm afforded him the opportunity he desired. The illness of the King is described as consisting in failure of reason and memory and loss of physical power, to the extent of not being able to stand upright or to lift up his head or to move without assistance from the seat which he occupied. During this time York, having obtained from the Pope a dispensation from his oath of obedience to the King, imprisoned Somerset, who however was soon released upon the King's recovery. The battle of St. Albans gained for him what he most wanted, the death of Somerset, for whose burial the Abbot petitioned the victorious Duke. This was the first of the thirteen battles fought between the rival Houses of York and Lancaster.

We may omit all consideration of the concerns of the Abbey which fill the Register for about ten years from this period. The next point of interest is the description of the heresies of Reginald Pecock, Bishop of Ely, which have probably found their way into the Register because of their bearing upon Church history, but which have no immediate connexion with St. Albans. It is remarkable that the copy of his recantation contains an item which does not appear in any other known copy. The last article about which the writer says that Pecock *hæreticavit contra judem* is as follows:—

Item, bene licebit unicuique Scripturam Sacram in sensu litterato intelligere, nec teneatur aliquis de necessitate salutis alieni alteri sensui inhere.

After this the Register takes no notice of succeeding events of history till the Council of Westminster in 1458, which the writer describes as an attempt to make up the dissensions that arose upon the slaughter of certain noblemen at the battle of St. Albans. The King's final award as to the terms of reconciliation is given in full, and may be read in the historians of the period or in Lingard, who gives it in brief. We need not notice it further, except that we should have been glad if, in regard to such documents as these, running over in this case as many as ten pages, the editor had supplied us with the same useful marginal analysis which he has so copiously given throughout the rest of the volume.

The King spent his Easter in 1459 at St. Albans, and left the Abbey to go to London after arranging that his Obit should be duly celebrated at the Abbey. Soon after this we light upon the proposals for celebrating the Council of Mantua. The prelates and nobles deputed are named, but the breaking out of the Civil War put an end to their embassy. And the Register from this point to the end is wholly taken up with the narrative of the dispute between the houses of York and Lancaster, with the exception of ten pages only, which relate to the management of the property of the Abbey. It is not till the autumn of 1459 that we have any intimation of the compiler's belief that the purpose of the rebellion was to place the Duke of York on the throne. We do not intend to follow the chronicler through the details of the war, which began so successfully for the King, and ended in placing Edward IV. on the throne as the legitimate heir of Lionel Duke of Clarence. The writer appears to have been as fond of rhetorical as of poetical effusions, and describes a mock trial of the insurgent nobles which is supposed to have taken place after the sack of the town of Ludlow, Justice coming forward against the accused and Mercy standing up in their behalf. This is preliminary to the description of the Act of Parliament passed against the insurgents, in which the King had a proviso inserted that he might show mercy towards them without the consent of Parliament. The next year, however, witnessed a change in the state of affairs, and the King was obliged to submit to being recognized as *de facto* King, to be succeeded at his death by Richard Duke of York, upon his consenting to waive his rights during the lifetime of Henry, when he was to act as protector and guardian to the King. His protectorate was shortlived, as he fell in the battle of Wakefield, December 30, 1460, leaving his son, the Earl of March, to make good his claim to the throne.

And here, obviously enough, the sympathies of the writer seem suddenly to change, and Edward's claim to the crown is acknowledged as paramount, he being the representative of Lionel, third son of Edward III., the great-grandson of Henry III. The whole title is described in a long series of villainous hexameters, in which also the fall of Henry and the defect of his title are mourned over, and the victory of Edward described in some concluding lines of congratulation; and the Register concludes with the names of the Queen, the Prince, and several other persons, who are pronounced by Act of Parliament dishonoured and attainted. The writer has

chronicled no further, and if his own description of his falling powers is correct, it is scarcely likely that he lived to witness any of the events of the year 1462.

STRANGERS AND PILGRIMS.*

WHAT may be called Miss Braddon's later manner, though not disfigured by the unnatural sensationalism of her earlier, and though making a creditable endeavour to keep off dangerous ground, and to have some kind of relation to a higher line of thought, is yet not wholly satisfactory. With the abandonment of her old exaggeration of theme she has lost the vigour of treatment which characterized her earlier productions, and her innocence is almost as rapid as her crimes were once fiery. It is becoming too much like milk and water in exchange for alcohol. We cannot help, too, having an uneasy sensation that in *Strangers and Pilgrims* there is something like an attempt to make literary capital out of the Bible, and this helps to diminish its claims on our consideration. *Strangers and Pilgrims* is a painful story, and confused in its rendering of character. It does not scan somehow, and seems to have been written mainly for a bitter attack on lunatic asylums, which is the point of the third volume. Lunatics are "trying" to people of higher mental qualities than those usually found in the unimpaired men and women who are chosen for attendants; and it is difficult to know what to do with people who, while retaining consciousness and perhaps an exquisite sensibility, are not to be treated with their own lives or the lives of those about them. We are sorry that Miss Braddon has swelled the cry against these asylums. Unconfining lunatics would probably inflict greater discomfort on their friends than they have themselves to endure in these places.

Of the real nature of the heroine we confess we understand but little. Given a girl of strong will, changeable temper, tenacious affection, and infinity of purpose, full of pride and self-abasement, pure, yet guilty of questionable conduct, deep and shallow, passionate and cold, and what can we make of her? Out of such contradictory elements it would seem hard to create a character that will stand; but this is the character of Elizabeth Luttrell. We are of course expected to be profoundly interested in her; but for our own part we cannot see much in her to like or esteem. Her beauty seems to be her only real fascination, unless we add her misfortunes; for she is rather wrong-headed than true-hearted. As a girl, in what she would call her degenerate days, she is pert and superficial, unloving to her sisters, and vain beyond even the large amount of vanity allowed to a pretty woman. She takes up with district-visiting and goodness because she is in love with her father's curate, Malcolm Forde, and wishes to "cut out" her eldest sister. She is in love with Malcolm mainly because he does not care for her. Hitherto she, of all the four Misses Luttrell of Hawleigh, has been the one before whom the curates have gone down to a man; but Malcolm Forde, who has been in the army before he entered the Church, is a man of a different stamp from the ordinary "young Levite," as Miss Braddon calls the pædic curate. He is moreover fortified against the beautiful Elizabeth on two sides; on the one by his resolve not to marry at all, being a priest and regarding priestly marriage as unholy; on the other, by his recollections of his dead and dearly loved Alice Fraser, to whom he had been betrothed. At first he looks on undazzled and unalarmed at the all-conquering beauty of Elizabeth, whereby he piques her pride; and it is only when he takes an interest in her soul, which she mistakes for love, but which is really in the beginning nothing warmer than spiritual philanthropy, that he falls into her toils. The witchery of her eyes, the sauciness of her tongue, and the unnatural success of her district-visiting subdue the man who sets out with a memory and an ideal, and who is described as noble, loyal, and self-controlled. We cannot but think that Miss Braddon has stumbled here over the same difficulty as that which beset her in *Robert Endleigh*. Men of strong will, and, with a purpose in life, are not of the kind to be drawn aside by love. In the lives of such women play only a secondary part; and when the very soul of a man's purpose is a religious objection to marriage, we scarcely think the drawing true which attributes to him, along with will, conscience, resolve, the fluidity of sensuous weakness. Such a man as Malcolm Forde would have commanded his fancy and his passions more thoroughly than Miss Braddon has allowed. He would have been keenly alive to the inappropriateness of an attachment between himself and a girl who had already shown more levity of temper, and more coquetry in mystifying him, than harmonized with depth or straightforwardness of affection, and whose passion, when it did express itself, had an ugly look of recklessness rather than of intensity.

On this last count it is Elizabeth herself, who, to borrow Miss Braddon's own style, "makes the running." She goes to Malcolm Forde's lodgings alone, seeking to interest him in her conversion—of itself a rather startling proceeding in a country town where everybody knows everybody else, and no lights burn under bushels—and she all but tells him that she loves him when she follows him into his garden on the night of his intended leaving-taking. To say the least, she lets him see her drift too plainly for any mistake to exist, and Desdemona's "hint" was less palpable than hers. After this, and when she is absolutely engaged to him, she goes up to London to have her long promised "season" in the

* *Strangers and Pilgrims*. A Novel. By the Author of "Lady Audley's Secret." 3 vols. London: Maxwell & Co. 1873.

house of her aunt, whose mind is bent on making her Viscountess Paulyn; and she enters into all the dissipation of the fast set in which she finds herself, with the Viscount at her elbow, making hot love to her. Yet her conscience is void of offence, because she likes to have Malcolm's letters in the morning, and because, when occasion occurs, she speaks of her love for him as no girl of natural pride or delicacy could speak of her lover to another man. All this part of Elizabeth's character and actions is quite out of harmony. Either she was sincere or she was not. If she had been sincere in her love for the one man, she would scarcely have placed herself in daily contact and peril with the other. If she had been a more weak, silly girl, waited hither and thither by every influence, her conduct would have been natural enough. But then in that case her tenacity of memory and her undying love for Malcolm through all her social success and brilliant position would not have fitted in. To be sure, women who brood much over the past are apt to invest their love with qualities which it never had. They forget their distastes, their qualms, their doubts, and remember only that they loved. Besides, it flatters them to imagine themselves constant in their inconstancy, and they forget the loop-line into which they have run, and go on again as if things had never known a break. But it could scarcely have been Miss Braddon's object to illustrate this tendency in the portrait of Elizabeth; nor do we think she means to have it understood that a strain of madness existed in her from the first to account for much that is inexplicable. Crazy heroines may be pathetic, but they are not interesting; and to have to forgive follies because they have been committed under partial mental aberration is a better excuse for the reader's charity than a proof of the writer's dramatic power.

We object altogether and on every ground to the conduct and character of Gertrude, the eldest Miss Luttrell. Her piety is simply grotesque; her love for Malcolm, though rather indicated than clearly made out, is unnatural, and her conduct in the matter of the anonymous letter is too suddenly and abruptly vile. As the eldest of the four sisters, her father's housekeeper and district-visitor, Gertrude was never worse than decently disagreeable. She was not delightful, but she was not a monster; so that when we find her suddenly confessing to an action through which her sister's life had been in part wrecked, and the extenuating circumstances of which are of the weakest kind, we are struck by a rawness in the colouring and violence in the outlines from which a veteran hand like Miss Braddon's should be free. The bitterness which runs through the whole story of *Strangers and Pilgrims* is seen nowhere more strongly than in the character of Gertrude. Of course Viscount Paulyn, being the husband, is a brute. In all novels the coarse-minded man who loves and marries in good faith the superior being who marries and acts in bad faith is the brute. That is indispensable. Without such a self-evident target, where would the slings and arrows of outraged womanhood strike? But really even the vulgar horse-racing Viscount had his griefs. He is not a very charming person all things considered; but a man who sincerely loves with the best love he has to give, if it is only the commonest kind of passion, a woman who gives him in return nothing but loathing and cold calculation, may be forgiven if he shows more temper than docility in the years which have to come to all whose marriage has tested character, and daily intercourse has brought down the goddess into the narrower domain of the wife. In the third volume a characteristic scene, too long to extract, ends with what we must think a piece of injustice on Miss Braddon's part, taking her, at her own showing, as the partisan of Elizabeth. She is now Lady Paulyn, and has been asking her husband to take her away from Slogh-na-Dyack, the Scotch castle to which they have retired, and near which Malcolm Forde is officiating as a temporary substitute for the minister of one of the churches. The Viscount refuses, and the conversation ends thus:—

"Be happy any way you please, so long as you don't worry me with this kind of thing. Come, now, Lizzie, be reasonable, you know. Let us retrench this year, and I'll give you a month or two in Park Lane in the spring. Of course I'm proud of you, and all that sort of thing, and I like to show you off. Only you've contrived to make it so confoundedly expensive."

"What other happiness do you suppose I expected when I married you, except the pleasure of spending money?" she retorted, in her coldest, hardest tone.

"Upon my soul, you're too bad," he cried angrily. "You're not the first woman that has married for money, by a long way, but I should think you're about the first that would look a man in the face and tell him as much without blushing."

And with this reproach he left her, to go back to his friends and smoke a moody cigar in their congenial society.

We would also notice two minor mistakes of treatment that do much to mar that truthfulness to nature which is of the first importance in a novel, and the want of which is not to be atoned for by any vigour of thought or vivacity of expression. When Malcolm Forde makes Elizabeth Luttrell his confidante, would she have so continually talked to him of his dead love? There is surely something not only indelicate, but unnatural, in the incessant references which seem to repudiate all sacredness and tenderness in a matter essentially both sacred and tender. Also, for a naturally reticent and resolute man, would Malcolm have told, first, his love affair with Alice to Elizabeth, and then that with Elizabeth herself, now Viscountess Paulyn, to Mr. MacKenzie? Again, when he saw his and her danger by their nearness of neighbourhood, would he not have found another friend for the Reverend Peter, and have escaped? Playing with edged tools is risky work, and Malcolm Forde was no fool. Still, with all its

faults, there is a certain quality of intensity in the character of this book which carries the reader over the faults and dreary bits, which are not a few. But why has Miss Braddon given way so much of late to melancholy and the exhibition of awkward in her dolls? Cheerfulness goes further than moping, and there is real sadness enough in the world without inventing so many artificial woes. We trust to meet our author in a brighter mood on the next occasion, and to see that she has conquered some of the bitterness, injustice, and passionate spirit of partisanship which sadden her latest story.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

ADVERTISEMENTS.

ROYAL ACADEMY of ARTS, Burlington House.—The President and Council of the Royal Academy are prepared to receive offers for the LOAN of fine PICTURES by the OLD MASTERS, for their ensuing WINTER EXHIBITION, but they chiefly propose to include the Works of eminent deceased British Artists. Proposers of such Works are invited to aid the Academy in their endeavour that the departed Members of their body shall be worthily represented.
By Order of Council,
FRED. A. HATON, Secretary.

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRÆTORIUM," with "Night of the Crucifixion," "Christian Martyrs," "Francisco da Rimini," "Nephtye," "Andromeda," &c., at the DORÉ GALLERY, 35 New Bond Street. Ten to Six.—Admission, 1s.

ELIJAH WALTON.—EXHIBITION including "A Storm at Sea" and "Band Storm in the Desert," and many new and important Drawings, Alpine and Eastern, NOW OPEN at Burlington Gallery, 111 Piccadilly. Ten to Six.—Admission, with Catalogue, 1s.

BRITISH MUSEUM.—The BRITISH MUSEUM is OPEN to the Public from Ten o'clock on Mondays, Wednesdays, and Fridays, and from Twelve o'clock on Saturdays. On application to the PRINCIPAL LIBRARIAN, special facilities are afforded for the study of specified branches of the Collections, on Tuesdays and Thursdays, to Classes or Parties of not more than Fifty in number for the Lower Galleries, and Thirty for the Upper Galleries.
J. WINTER JONES, Principal Librarian.

ST. BARTHOLOMEW'S HOSPITAL and COLLEGE.—SCHOLARSHIPS IN SCIENCE.

Two Scholarships in Science have been founded at St. Bartholomew's Hospital:
1. An Open Scholarship of the value of £100, tenable for one year, to be completed by 30 September. The Subjects of Examination are Physics, Chemistry, Botany, and Zoology. Successful Candidates will be required to enter at St. Bartholomew's Hospital in October next.
2. Preliminary Scientific Scholarship of the value of £20, tenable for one year, to be completed by 1 October next, by Students of the Hospital of less than six months' standing. The Subjects of Examination are identical with those of the Open Scholarship.
For further particulars and syllabus of subjects, application may be made, verbally or by letter, to THE WARDEN of the College, St. Bartholomew's Hospital.

MINISTERIAL CHANGES.

THE Ministry appears to be in the position of an invalid who in the restlessness of debility constantly tries to gain ease by some trifling shift or turn on his couch. It cannot keep still for a week, and a new attempt to gain ease is now announced in the shape of what is termed the retirement of Mr. MONSELL. That unfortunate possessor of Ministerial honours is to be got rid of because it has been discovered that the Post Office has become too big a concern for mediocrity to manage. It is, indeed, impossible to conceive a greater damper to Parliamentary ambition than that which it has been Mr. MONSELL's lot to offer for contemplation. It appears that he was selected to fill the office of Postmaster-General on the two grounds that his appointment would please the Ultramontanes, and that the office was so unimportant that even Mr. MONSELL could fill it. Mr. MONSELL thoroughly appreciated the reasons which had led to his appointment. He was expected to be a cipher, and he behaved like the cipher he was expected to be. He made no attempt to control the machinery of the office of which he was nominally the head. His subordinates disposed of vast sums of money without taking the trouble even to let Mr. MONSELL know what was being done, and corresponded directly with the CHANCELLOR of the EXCHEQUER. Mr. LOWE and Mr. SCUDAMORE managed or mismanaged the Post Office between them, and saved themselves much time and worry by ignoring Mr. MONSELL altogether. The gratification of the Ultramontanes was considered to lie in Mr. MONSELL's being called Postmaster-General and receiving his salary, and to be quite independent of his doing anything for his money. It was, indeed, necessary to use his name for the publication of an absurd and vexatious edict forbidding the transmission of stamps by post, and he had to undergo the humiliation, if his weak mind is capable of understanding the meaning of the term, which was involved in having immediately to revoke this edict in deference to the opinion of the House of Commons. But in general there was no occasion to disturb him from the repose of utter insignificance. When the scandals of the misappropriation of Post Office money and of the Zanzibar Contract were revealed, he told with gentle candour the story of the process by which he had been reduced to a mere nonentity in his own office. He did not complain, or show any signs of irritation. He merely entreated the House of Commons to observe that he was a good, harmless, inefficient sort of man, and craved indulgence on that unanswerable plea. Censure and criticism were thus disarmed, and no one had a hard word for this mildest and humblest of officials. His punishment has now come in as mitigated a shape as possible. He was not at once removed from the sphere of mischief, like the fiery AYRTON and the irrefragable LOWE. He was allowed, when the first transformation of the Ministry was made, to go on calling himself Postmaster-General. Even now, when his turn has come, he is not abruptly dismissed. He is to continue, in the humorous language of official life, discharging the duties of his post until his successor is appointed, and that is to be before October; so that during September, at any rate, he is to have the pleasure of exhibiting that mediocrity of intellect in the conduct of his department which he has been given to understand will no longer suffice for its proper management.

That this should be the end of a long Parliamentary career, and of an attempt to please the Ultramontanes, suggests many reflections as to the vanity of human wishes and purposes. But we are obliged to forget Mr. MONSELL when we are told that his retirement is only the prelude to

a further transformation of the Ministry on a large scale. The basis of the GLADSTONE Cabinet appears to be that so long as Mr. GLADSTONE is Premier anybody else may be anything without making much difference. The whole composition of the Cabinet is thus thrown open to speculation, and kind friends of the Government are at liberty to make any suggestions they please as to the distribution of offices. The last scheme that has been started with somewhat of a solemn and semi-official air is that the Duke of ARGYLL should be discovered to be weary and ill, and should take Lord ABERDARE's place, that Lord ABERDARE should get any little post he can lay his hands on, and that Mr. LOWE should leave the Home Office and rule over India. This, it is thought, will be a source of much ease and comfort to the Ministry, because, by the time the remote Indians have begun to be dissatisfied with Mr. LOWE, the whole Cabinet will probably be out of office; whereas the calamities he would cause by being at the Home Office would be immediately felt, and the Ministry would suffer for them at once. Mr. LOWE is to speak at Sheffield next week, and may possibly give some hint of the feelings which the suggestion has awakened in his mind. But even if he keeps a discreet silence, it will be difficult to conceive that he can regard with equanimity a proposal to remove him from an office which he has not held a month, on the ground, not that he has misconducted himself in it, but that he is by nature so disagreeable and wrongheaded that he is sure to misconduct himself in it. To acquiesce in such a view of his character and probable conduct would be an avowal of defeat and disgrace which Mr. LOWE might prefer to avoid by resigning office altogether. The framers of these schemes of Ministerial reconstruction appear to omit from their consideration the possibility of men of some eminence thinking that to form a part of the Ministry in its present dilapidated condition is no such great gain as it is said to be. It is said that part of Mr. GLADSTONE's new arrangements should be the inclusion in the Ministry of a certain number of conspicuous independent Liberals, and the claims of Mr. BOYER and Mr. HARCOURT are especially selected for recognition. What office is proposed for Mr. BOYER is not divulged. The startling thought seems to have occurred that he might be made Home Secretary, but to have died away as too big for utterance. But a post has been contrived for Mr. HARCOURT by suggesting that Mr. MONSELL should be replaced by Mr. AYRTON, who is pronounced to be exactly the man to look after letters, and who certainly would vex the soul of Mr. SCUDAMORE in a way that would amply punish him for any misdeeds of which he may have been guilty. This would leave the office of Judge-Advocate-General open, and as it is an office which has a judicial flavour about it, it would, it is imagined, exactly suit the taste of Mr. HARCOURT.

If humble posts of this kind are offered to Mr. BOYER and Mr. HARCOURT and are accepted by them, that will be their affair, and the public will have no reason to complain. Considering that when Mr. GLADSTONE's Ministry was formed the Under-Secretaryship of Foreign Affairs was offered to and refused by Mr. HARCOURT, no one can say that five years afterwards, when the Ministry is in a state of collapse, the post of Judge-Advocate-General, which has been kept in abeyance for years as a useless sinecure, is above his pretensions. But if the Government wants to secure the services or the silence of conspicuous independent Liberals, and can get what it wants at such a price, it must be allowed that it will get it uncommonly cheap. What is the good of holding a minor office for a few months under an Administration that is struggling daily for existence? The independent member gives up his position, his pleasure,

his power, when he takes office; he must speak as he is told, defend the measures of his superiors, and toil through weary hours in order to make and keep a House. Even when the Ministry goes out, he is still a humble part of the recognised Opposition, and has to obey his leaders when out of office almost as much as when they were in office. The temptation seems exceedingly small, and it may be added that a member to whom such a bargain is now proposed will naturally think of his constituents. It certainly is no recommendation to electors that a candidate should be associated with the present Ministry, and a seat might be safe enough if sought for by an independent Liberal, which would be greatly endangered if the candidate appeared as the holder of some tiny Ministerial appointment. If the Government could be strengthened by the admission to its bosom of some of the leading Liberals outside it, the gain might counterbalance the cost of disappointing some of those obscure followers of the Government who think they have earned promotion by fidelity and length of service. But the probability is that what is proposed will be found impossible, and that no strength can accrue to the Government from this source. Nor is it in the least likely that any further transmutations in the existing Ministerial circle can do any good to the Government. To push Lord ABERDEEN and Mr. LOWE out of offices which they have only held for a few weeks in order to put some one else in, and to contrive new holes for the outgoing Ministers, will only increase the impression of weakness and incapacity for the effective discharge of administrative duties which the Government has created. There may be reasons not known to the public for further changes. Discord and jealousy may need to be appeased, or Mr. GLADSTONE may have cause to think that, unless he makes new arrangements, business cannot be carried on. For such reasons it may be worth his while to incur the risk of producing a bad effect on public opinion by another recast of his Cabinet. But the fact that he has to make another change, and cannot face Parliament again with the present distribution of his forces, must do him some harm in general estimation, and cannot possibly do him any good.

THE DUKE AND DUCHY OF BRUNSWICK.

THE will of the crazy and disreputable prince who was notorious as titular Duke of BRUNSWICK is worthy of his career. It may be doubted whether the document ought not to be considered invalid through the indications which it contains of partial or possible derangement. If the Duke of BRUNSWICK was not strictly insane, his character was formed after the type of the more extravagant and vicious Roman Emperors, whose moral perversity often seemed to affect their intellectual condition. His first care is to provide for an inquiry into the cause of his death and for the disposal of his body, and he then requires the erection of a gorgeous monument to perpetuate as long as possible the memory of an ignominious existence. A number of physicians are to ascertain whether he has been poisoned; and his remains are to be deposited at Geneva in a mausoleum above ground in a dignified and prominent position. Over the tomb is to be erected an equestrian statue of the deceased, and in his unworthy company are to be placed effigies of his famous grandfather, and of his father who died gloriously at Waterloo. The executors are enjoined to spare no expense, and to employ the most celebrated artists. Having as far as possible indulged his posthumous vanity, the testator next proceeds to gratify his feelings of resentment. The executors are prohibited from entering into any compromise with his brother the reigning Duke, or with his distant kinsmen the Hanoverian princes. Finally, all his property, real and personal, including rights which are scarcely the subject of testamentary disposition, are, subject to a few legacies, given absolutely to the city of Geneva. The enumeration of the details of his property recalls passages from English dramatic poets who have sometimes revelled in the description of imaginary wealth. Castles, domains, forests, estates, mines, saltworks, hotels, houses, parks, libraries, gardens, quarries, diamonds, jewels, silver, pictures, horses, carriages, and many other items, swell the catalogue of riches which failed to secure to the head of the old House in Europe the smallest consideration or respect. All these things it may have been in the Duke's power to defend and to bequeath; but other assets will scarcely be so easily by the city of Geneva. "That important part of

"our fortune which has been taken by force from us and kept since 1830, with all the interests in our Duchy of Brunswick"—a phrase which has perhaps been mistranslated—will scarcely be claimed by the legatees or surrendered by the actual holders. It may be presumed that, according to the law of the Canton of Geneva, the will will operate on the personality, unless it is set aside on the ground of unsoundness of mind. Difficult questions may arise as to the lands and houses which are devised; and the property which is attached to the Dukedom of Brunswick was clearly not at the disposal of a prince who had been long since dethroned. It seems that a previous will in favour of the Prince Imperial of FRANCE was revoked in 1870, either on the declaration of war or after the disaster of Sedan. Any feeling of patriotic indignation against the wanton assailant of his native country would have been entirely foreign to the character of the banished Duke. The will had probably been framed in the hope of embroiling France and Germany, and it may have been revoked when the beneficiary had become incapable of asserting by force vexatious claims on a German dukedom.

The fortunes of the great House of WELF, which culminated at the beginning of the thirteenth century in the person of HENRY the Lion, revived, after a long period of obscurity when the head of the younger branch of the family of BRUNSWICK married the daughter of the English princess ELIZABETH, Queen of Bohemia, and obtained the erection of his duchy into a ninth electorate. Duke FREDERICK of Brunswick, younger brother of the reigning Duke of the elder branch, one of the ablest among the lieutenants of FREDERICK the Great, commanded the English contingent at the battle of Minden. His nephew commanded the Prussian army which invaded France in 1792; and he might probably have occupied Paris if he had not been deluded into calculated inaction by DANTON and DEWOLLE, who flattered him with the empty hope of ascending the throne of France. His considerable military reputation was compromised when he fell at the battle of Austerlitz; and his son, the father of the deceased Duke, could only sustain the character of his House by his gallant death in the field of battle. The heir to the dukedom grew up an unbecoming tyrant, and the German Diet continued the sentence of deposition which had already been anticipated by a popular revolution in 1830. The Dukes and other minor princes of Germany had from time immemorial acknowledged the superiority of the Emperor; and they were in certain respects amenable to the jurisdiction of the Imperial Courts. Under the Federal Constitution which had been substituted at Vienna for the old organisation, the Diet succeeded to a right of interference which was not wholly inoperative for the restraint of petty potentates. The Dukedom of Brunswick corresponds in extent and population to an average English county; and even if the theoretical right of sovereignty had been absolute, it is obvious that the ruler of a petty province cannot, in the midst of well-governed States, really exercise the powers of a despot. In the eighteenth century the Dukes of Brunswick, though their allegiance was exclusively due to the Empire, had, like many of the minor princes in the North, become practically dependents of Prussia. The ducal dynasty owes the retention of its dominions to its fortunate weakness. In 1866 Brunswick necessarily adopted the cause of Prussia, while Hanover rashly affected an impracticable and ruinous independence. Notwithstanding the progressive consolidation of Germany, it is not impossible that the successors of the present EMPEROR may continue his policy of preserving as far as possible the rank and authority of the princes of the Federation.

The reigning Duke of BRUNSWICK is childless and advanced in years. At his death the succession to his dominions will probably be determined by mixed considerations of law and expediency. The ex-King of HANOVER, whose ancestors branched off in the sixteenth century from the House of BRUNSWICK-WOLFENBUTTEL, is probably the nearest kinsman of the reigning Duke in the male line; but a minute knowledge of treaties and family compacts would be required before the right of succession could be determined. The reigning families of Germany often exercised a power of modifying the strict rules of inheritance by contracts of so-called hereditary fraternization which created between the parties a reciprocal right of succession. As the Houses of HANOVER and BRUNSWICK have been repeatedly connected by intermarriage, it is not improbable that they may have formed between them-

selves engagements which may affect the title to the dukedom. The history of Germany down to the fall of the Roman Empire furnishes innumerable instances of quarrels on rights of succession, which were occasionally decided by agreement or litigation, and not unfrequently by war. In recent times the title of the Duke of AUGSBURG to Holstein was only established to be set aside, first by the Great Powers of Europe, and afterwards by the victorious arms of Prussia. The heir of Brunswick will owe his succession to the uncontrolled choice of the Imperial Government of Germany. It may be conjectured that the EMPEROR would not be unwilling to grant the dukedom to the King or Crown Prince of HANOVER in compensation for the loss of their kingdom; but the Hanoverian family have since their fall constantly preferred to their own material interests the empty assertion of their rights as legitimate Pretenders. The King of HANOVER would have welcomed the success of France against Germany if the war of 1870 had resulted in the restoration of his dominions. Henceforth an indispensable condition of the exercise of nominal sovereignty in Germany will be loyal adherence to the constitution of the Empire. If the princes of Hanover refuse compliance with the terms, the Duchy of Brunswick will be annexed to Prussia, or perhaps to the German Empire; or it will be transferred at the pleasure of the EMPEROR to some less impracticable nominee. The Duke of CAMBRIDGE, who comes after the family of Hanover as next-of-kin to the Dukes of BRUNSWICK, is supposed to share their disapproval of the annexation of the kingdom to Prussia. It may be doubted whether the English COMMANDER-IN-CHIEF would care to exchange his English rank and allowances for a petty foreign dukedom; and as the Duke of CAMBRIDGE is unmarried, his succession would only postpone the necessity of providing for the ultimate disposal of the territory. The sons of the Queen of ENGLAND are, according to German law, utter strangers to the succession. The union of Brunswick with the distant principality of Coburg-Gotha would be awkward and inconvenient; and it would seem an absurd alternative to convert a second English prince into a little German potentate. It is barely possible that the Court of Russia might be gratified by the transfer of the vacant dignity to the son-in-law of the Emperor ALEXANDER, but such an arrangement would have been more probable thirty years ago than at the present time. It matters little, except to the three hundred thousand inhabitants of the duchy, how the question of succession or annexation may be finally settled; but the German princes will watch with natural anxiety the manner in which the Imperial Government may think fit to deal with a lapsed fief, or vacant possession. If the Empire is declared to be the heir of all princely families which may happen to die out, the same process will have commenced by which some great European kingdoms were originally constituted. The Imperial Government is probably not anxious to accelerate the centralization of nominal as well as of real authority at Berlin. The minor potentates are never again likely to be tempted into connivance with alien enemies or invaders, for the reigning families would be summarily deposed by their subjects if they were guilty of treason to the nation. It happened by an odd coincidence that the late Duke of BRUNSWICK protested in his will, not against the aggressions of Prussia, but against the alleged injustice of the dethroned King of HANOVER.

THE FUSION, THE CHURCH, AND THE GOVERNMENT.

THERE seems a disposition in Paris, at all events among the Republicans, to underrate the probability of a serious attempt being made to place the Count of CHAMBORD on the throne. The visit of the Count of PARIS to Prohonor took the public by surprise, and most people jumped at once to the conclusion that everything was prepared for a Restoration. Now they see that there is still a great deal to be arranged; and they are consequently tempted to go to the other extreme, and to assume that, because nothing has been done yet, nothing will be done at any time. They forget that the Fusionists have no real reason for hurrying matters. It is very important that they should have resolved upon a course of action by the time that the Assembly meets in November, but there is no need that their policy should be set on foot, and published in the newspapers by the 1st of September. A premature dis-

closure would be likely to do them harm rather than good. It would give notice to the Republican party of the point at which the attack is to be made, and thus supply a motive purpose to their preparations for resistance. The fact that the obstacles which have stood in the way of any real co-operation between the two parties among the Royalists have not been removed hardly proves that they will be still in existence two months hence. Supposing that the Count of CHAMBORD has shown himself impracticable upon the question of the flag or the charter, nothing would be gained by announcing it. He may change his mind, or some new and more ingenious combination may succeed in satisfying scruples which have hitherto survived every suggestion of compromise. The proposal that the white flag and the tricolour shall both be used, the one as recalling the ancient glories of the French Monarchy, the other as symbolizing the modern victories of the French army, is in itself sufficiently reasonable; and it is difficult to believe that, if a Restoration should prove to be otherwise possible, it would come to nothing on such a trifle as this. The difficulty about a charter is more serious, because the two sections of the Royalists are equally opposed, the one to a restoration in which a Constitution is imposed upon the Sovereign by the Legislature, the other to a restoration in which the Legislature accepts a Constitution from the Sovereign. It may turn out, however, that there is no imperative necessity for a Constitution being either imposed or accepted. France has got along very well without one for the last two years and a half, and though the Provisional Government has been found inconvenient, it has been by reason of the uncertainty as to its ultimate character, not of any technical defects. If the Assembly were to proclaim the Count of CHAMBORD King, there would be no difficulty in adding a Second Chamber and introducing such limitations as may be thought necessary in the suffrage without the words Charter or Constitution being even spoken. France has all the essentials of a working Constitution already, and so long as she has a Legislature—a blessing of which the Count of CHAMBORD probably does not propose to dispossess her—the means of adding to or modifying those essentials lie ready to hand.

Even the Count himself probably sees that his chances of success is far greater than it has ever been before; and though, left to himself, he might prefer the gratification of his own obstinacy to the Crown of France, it is not likely that he will be left to himself. The most serious feature, perhaps, of the monarchical movement in France is its association with religion. The Roman Catholic Church has once more definitively allied herself with the Legitimist cause. In all the crowds of pilgrims who throng the sanctuaries of La Salette or Paray-le-Monial, there is probably not one who does not pray for the restoration of HENRY V. as well as for the restoration of Pius IX. This association with religion is an element at once of weakness and of strength. To the French middle class, no doubt, it is an additional obstacle to be got over. They do not like priestly domination, and they would much rather have their lives and properties made safe in this world without being troubled to make their souls safe in another. On the other hand, it is rather hard nowadays to get up much enthusiasm for hereditary Monarchy, and yet in fighting the Republicans enthusiasm is a most valuable weapon. The Church is in the highly advantageous position of having a large stock of enthusiasm to dispose of. There is apparently a genuine revival of religious feeling in France, and the clergy have had it very much in their own power to decide whether it should be turned to the account of any one political party. The character of the Count of CHAMBORD has determined them to use it in his favour. HENRY V. will not only be a good Catholic at home; he will be a good Catholic abroad; and at present this is the more essential qualification of the two. He will be the only Sovereign in Europe who has any personal zeal for the Pope—any desire, that is, to see his temporal dominions restored to him irrespectively of political considerations. M. THIERS is sound on the Roman question, but then he is sound for political reasons, and political reasons may change. If M. THIERS had seen his way to securing the Italian alliance for France, the Pope might have been confined to the Vatican for the rest of his life, even though he were to double, instead of equalling, the years of PETER. This is not the kind of support which the Roman Catholic Church wants. It will put up with it if it can get nothing better, and some of its shrewder politicians might even have preferred it as being likely to wear longer. But the Count of

CHAMBORD's devotion to the POPE for the POPE's own sake is naturally more to the taste of PIUS IX., and the influence of the Church in France has been given unreservedly to the Legitimists. It is not only as supplying the aid of religious enthusiasm that this adds strength to the Royalist cause; it supplies, what in the present instance may be almost as valuable, a means of bringing the Count of CHAMBORD to reason. If there is anybody who can make him tolerate the tricolour and recognize modern institutions it is the POPE; and though the POPE is as obstinate as the Count of CHAMBORD where his own prerogatives are concerned, he has only a very moderate reverence for other people's prerogatives. He is not likely to see the Count making up his mind to throw away his last and best chance without trying to change his purpose, and when PIUS IX. preaches concession, the sermon will at all events have the force of novelty. On the whole, therefore, we think it probable that November will find the Fusionists still bent upon carrying out their aim.

A good deal has been made of a speech of the Duke of BROGLIE, in which he preached the necessity of union among Conservatives, and called upon all honest men to rally round Marshal MACMAHON. Some critics have treated this speech as though it were intended to mark his disapproval of Fusionist projects. This view seems to be founded on a misconception of the Duke of BROGLIE's position. He is not himself a Fusionist; he is the leader of that Conservative Coalition of which the Fusionists are one element among several. If they were to succeed in absorbing those several elements, or were to become so unmistakably the strongest section of the Coalition that the alienation of the other sections would be a matter of no moment, the Duke of BROGLIE would no doubt declare in favour of a Restoration, and call upon all honest men to rally round HENRY V. But as yet the prospects of the Fusion are uncertain, and the Duke is bound to remember that the interests of Conservatism may survive the interests of the Monarchical party, and might be injured by premature identification with it. It is not for him to depreciate the authority of Marshal MACMAHON; on the contrary, it is as important for the Monarchists as for the Conservatives that this authority should be recognized and sustained. Marshal MACMAHON means the army, and without the army the Restoration could not last for a week. Consequently the Duke of BROGLIE's speech proves nothing as to his own belief in the Fusion, and need have no hostile influence on its prospects. It must be a very fanatical Royalist who would wish Conservatism itself to be identified with a lost cause, and a very sanguine one who would not admit that it is still possible, though, as he would insist, highly improbable, that Monarchy may yet be included among lost causes. The Duke of BROGLIE has better means of assuring himself as to the feeling of the country than can be at the disposal of any one who is not a Minister; and he may see reason to suspect that the deputies of the Left Centre will come back from visiting their constituents with a more settled conviction in favour of a Conservative Republic than has lately been attributed to them. In that case the majority in the Assembly in favour of proclaiming HENRY V. would be very small indeed; and though the Duke of BROGLIE has more courage than statesmanship, it is not likely that he will be so reckless as to wish to found the Monarchy on the support of one-half of the Assembly plus one. Again, it is better for the Royalists that they should appear to have converted the Duke of BROGLIE, by proving that the country is with them, than that the Duke should be supposed to have been a Royalist in disguise even when he professed to care nothing for the form of the Government provided that its substance was Conservative. Therefore, even if he were actually in league with the Fusionists, which appears improbable, he would have made precisely the speech which he has made. If a Government which claims to have no other end in view save to carry on the conflict with Radicalism accepts Monarchy as the standard under which it can fight the battle most hopefully, the impression made on the country is just what the Royalists themselves ought most to wish for.

THE EDINBURGH WORKING-MEN'S MEETING.

A LARGE meeting of workmen was lately held at Edinburgh to denounce the unpopular portions of the Criminal Law Amendment Act. Assemblages of this kind

are often described by their promoters as Demonstrations; and the phrase, however vulgar, indicates with approximate accuracy their purpose and character. The object is not to reason or to persuade, but to exhibit the numerical and physical strength of those who join in the agitation. A procession of eight thousand, or, according to another estimate, of sixteen thousand, persons traversed the streets of Edinburgh with the pomp which gratifies the unsophisticated taste of Scotch as of English mechanics. Some of the banners, preserved since the days of the Reform Bill, were probably unintelligible to the present generation, as they commemorated the public services of Lord GREY and Lord BROUGHAM; but there were also symbolical illustrations of the operation of the Criminal Law Amendment Act, including a picture by an ambitious artist of the commitment of a little boy to prison "in presence of a weeping mother and an execrating public." The members of Parliament who had been invited to attend unanimously excused themselves, with or without professions of sympathy. Mr. TREVELLYAN, as became an extreme democrat, expressed his approval of the object of the meeting; and Mr. AUBERON HERBERT, in a long letter, assured the astonished Trade Unionists that working-men "believe in the sacred duty of respecting individual liberty, and look with horror and detestation on all acts, by whomsoever they are done, which infringe upon this liberty." Mr. HERBERT's "complaint against the Act" is that certain actions which do not deserve imprisonment are included in the definition of 'molestation,' and that "an unusually heavy punishment is assigned to those actions, because they are supposed to be done with an intention to 'coerce.'" It is unfortunate that a scrupulous and delicate regard for individual liberty should express itself in acts which a perverse Legislature mistakes for molestation and coercion. The speakers at the meeting were less inclined to dwell on the sacred right of "picketing" than on the provisions of the Act which render certain breaches of contract criminally punishable. The judicial interpretation which has been given to the law of conspiracy constitutes a more solid grievance, and the Edinburgh orators denounced with cordial animosity Lord CAIRNS, the House of Lords, and the Conservative party in general. Some of them were of opinion that Mr. BRUCE had been the worst enemy of the working class, and at the same time they expressed the reverse of confidence in his successor. Mr. VERNON HALLGOURT had fairly earned the gratitude of those artisans who are dissatisfied with the present state of the law. The Bill which he introduced might perhaps have passed the House of Lords if the Government, which had originally discouraged his interference, had not converted a measure which would have remedied the grievances of the workman into a new law of conspiracy. Lord CAIRNS was justified in declining to discuss at the close of the Session a questionable alteration in one of the most difficult parts of the criminal law.

The speeches at the meeting were naturally monotonous; nor indeed has entire unanimity of sentiment any tendency to encourage eloquence. The use of speech, and especially of public speech, is to persuade, to convince, or to inform; and there is for the most part little use in declaiming to an audience which has adopted beforehand the conclusions of the speaker. The language which was used was for the most part temperate and decorous, though one enthusiastic advocate of Mr. AUBERON HERBERT's individual liberty proposed, it is to be hoped in a metaphorical sense, that certain "English rats" who had ventured to compete for work with Scotch compositors should be summarily strangled. When some dissatisfaction was expressed by a portion of the audience, the orator defended his proposition by the forcible argument that, according to the laws of nature, all vermin ought to be strangled. The minor premiss of the syllogism must have been that English non-Unionist workmen were properly described as vermin. Much interest was excited by the appearance of a victim of tyranny who had been imprisoned for a few days on a charge, as he said, of looking at a recreant who had deserted the Union. There are ways of looking at a person engaged in an unpopular act which, if they are practised by considerable bodies, may perhaps not be unreasonably thought to amount to molestation. At the same time it is possible that magistrates may occasionally be biased against members of a Union who are charged with attempts to coerce their non-conforming comrades. While some Unionists only look significantly at obnoxious workmen, others hold that the delinquents ought to be

strangled as vermin. If the class which was represented at the Edinburgh meeting should hereafter obtain control over legislation, it is certain that all the securities which now afford protection against the dictation of the Unions would be at once repealed. Other classes have been more or less selfish; but the working-men and their advisers professedly look exclusively to their own interests. No agitator against the law as it stands even affects to devise a remedy for breach of contract with an employer. The consumers will hereafter feel the benefit of absolute dependence on those who contribute manual labour to production.

The next election will diminish the existing uncertainty as to the extent of political power which has been conferred on the organized part of the working classes by the Reform Act of 1867. The principal speakers at the Edinburgh meeting urged their adherents to vote only for members who would promise compliance with their demands. It was also suggested that Mr. M'LAREN, who has given offence by his conscientious votes on the Criminal Law Amendment Bill, should be supplanted as member for Edinburgh by a working-man. Recent elections have not given encouragement to the advocates of democratic supremacy. Even at Dundee a local employer of labour obtains a considerable majority over a professed philanthropist whose theories border on Socialism. It has been conjectured with some probability that the smaller class of traders take advantage of the Ballot to express their jealousy of prosperous labourers and artisans. The great increase in the cost of living is perhaps attributed to the general rise in wages, which is but one of its secondary causes. The overbearing language of the working-class agitators produces a more legitimate resentment. It is still possible that the inference which has been drawn from isolated and occasional contests may be falsified by the result of a general appeal to the constituencies. The voters who exercised their franchise for the first time in 1868 were in many boroughs indifferent to political questions; nor had their forces been regularly organized. The political strength of the working class will not be fully tested until a general election turns on some question in which they are specially interested. Their leaders have with some adroitness taken advantage of casual opportunities to create excitement on the questions arising out of the Criminal Law Amendment Act and the law of conspiracy. It might be plausibly contended that the working class is interested in the enactment and enforcement of strict laws for the prevention of undue interference with the individual liberty, and for the enforcement of contracts; but it is not to be expected that penal legislation should be popular with those against whom it seems to be directed. If the indignation which has been loudly expressed at public meetings is generally and sincerely entertained, it is not improbable that the new electors may be induced to concentrate their support on candidates who will pledge themselves to the repeal of the obnoxious laws. The influence which has been for two years exercised by the publicans illustrates the power which may be exercised by sections of the community when their own interests are specially affected.

It is pleasant to find that even in a political gathering there was room for the gratification of ordinary tastes. A demonstration has the incidental advantage of serving as a reason for a holiday, and the younger attendants, at the meeting proceeded, when the speeches were over, to amuse themselves with dancing and similar recreations. The flags and the brass bands, and more especially the men in armour who form an indispensable element in popular processions, gave perhaps as much pleasure to the multitude as the eloquence of the speakers. A less satisfactory accompaniment of the meeting was an unusual amount of drunkenness. It may be taken for granted that the agitators and their more serious followers are too much in earnest to disgrace themselves by intemperance, but a large assemblage, whatever may be its object, always displays the characteristics of a mob. The same reasons which induce demagogues to arrange processions and to collect crowds have gradually put an end to all attempts to hold public meetings for discussion. It is found necessary that a popular audience should be of one way of thinking; and consequently the Houses of Parliament have gradually become the only places where debate is still allowed. The attendants at meetings of workmen probably fancy that statements and arguments which are never in their hearing answered are therefore unanswerable, and a Legislature which hesitates to comply with their demands is regarded as perversely tyrannical. It is not unlikely that some of

the more prominent leaders of Trade Unions may find their way into the House of Commons at the next election, nor would it be just to blame them for their natural ambition. At first they will perhaps be surprised to find that there are two sides to many political questions; and that Parliamentary tradition secures entire freedom of speech to all parties. If at any future time the middle classes are practically disfranchised by further extension of the franchise, it will not be surprising if Parliamentary debates degenerate into "demonstrations." The Government will probably rally the working classes to its side by offering them an enormous augmentation of their strength through the establishment of household suffrage in the counties. It remains to be seen whether the opposition to the measure which may be expected from other sections of the constituencies will counterbalance the benefit which the Ministers hope to gain.

FRENCH GENERALS AND REPUBLICANS.

LAST week we noticed the evidence of General DECROT given before a Parliamentary Commission. It was so much more vigorous and decisive than that of any other witness, and it expressed so forcibly the feelings of those who hate the Republic not only for its own sake but on account of the memories of the war, that it deserved especial notice. But the volume in which it appears is composed almost exclusively of evidence given by different generals. It is, in fact, an embodiment of all that those in command of French armies after Sedan have to say for themselves in the way of defence of their acts or in reproach of other people. It is therefore not without importance that we find the Generals, as a rule, evidently speaking with great soreness of the treatment they received and the conditions imposed on them. It is obvious that almost all of those who gave their evidence think that the rule of any such Republic as that which would recognize M. GAMBETTA as its chief would not at all suit them. Of M. GAMBETTA personally they almost all speak with respect, if not with admiration. But of his subordinates many of them speak with intense irritation, and they object to the whole system of managing affairs which then prevailed in France, on the double ground that it placed the care of important interests in the hands of ignorant men, who ordered experienced professional men about without knowing anything of the elements of the profession of arms, and that it inevitably led to the sacrifice of the country to the interests of a party, and the postponement of all other claims to those founded on a clamorous and obtrusive devotion to the Republic. As to the latter ground of complaint, it must be owned that the Generals had less reason to complain of it than any one else. All of them own—some of them reluctantly, and some of them eagerly—that M. GAMBETTA selected the best men he could, and stuck honestly and fairly by those whom he had chosen. He gave the command of the Army of the Loire to D'AUDELLE, who was as little of a Republican as possible, and who records for the benefit of the Commission the delight with which he witnessed his men go to church in the midst of their trials and defeats. BOURNAZI was removed from the command of the Army of the North on account of a clamour raised against him as an Imperialist; but he owns that the reception he met with from GAMBETTA appeased his wrath, and he was entrusted with the conduct of the last effort that was made to arrest the tide of adverse fortune. There can be no doubt that while the Republicans were in power they, like every other party in France, used the opportunity to promote friends and displace enemies; but this was not the case in the higher commands of the army. So far as supposed merit ever is the source of promotion in this world, it was the main, and perhaps the only, source of promotion to such commands while the Dictator of Tours ruled France. What is true is that he and his friends put the machinery of ordinary government into the hands of Republicans as much as they could. What is not true, on the showing of the Generals themselves examined before the Commission, is, that he looked to anything in his appointment of a general except his supposed capacity of beating the enemy.

What the Generals really complain of is that they were subjected to the surveillance and dictation of two subordinates of M. GAMBETTA who knew nothing about war, who took upon themselves supreme authority, and who were

constantly urging them to commit what were obviously blunders, and to attempt impossibilities. These two subordinates were M. DE FREYCINET, who was appointed by GAMBETTA as his delegate in the Ministry of War, and M. DE SERRES, who was simply appointed as an attaché to the Council of War. They were ardent and eager in the discharge of their duties, which seem to have been of the vaguest possible description, and they freely gave what to all appearance were orders to the different generals in command, although, when examined before the Commission, they insisted that what they gave were not orders so much as indications of what the civil authorities thought the military chiefs might conveniently do. M. DE SERRES more especially took upon himself to send General CREMER an order to shoot a spy, and General CREMER at once obeyed, and shot him. But M. DE SERRES insisted that a competent general would have read between the lines, and understood that the man was to be shot only after he had been satisfactorily proved to be a spy. In spite of his declarations, the order seems as positive as it was possible to make it, and M. GAMBETTA acknowledged that M. DE SERRES in his zeal had occasionally assumed an authority beyond that to which he was entitled. As we read the whole story it becomes evident that M. GAMBETTA and his subordinates did in point of fact give a variety of orders which were foolish and based on a wrong appreciation of circumstances, that they often did not know where the forces they were directing were, or of what materials they were composed, and that they started large bodies of troops on adventures of a very rash kind without having taken care that the men should be provided with the means of transport and with enough to eat. The expedition of BOUBAKI to the East was entirely the work of M. GAMBETTA and his subordinates, and M. DE SERRES seems to claim for himself the chief credit of having devised it; but he is obliged to own that the troops sent on this foolhardy adventure were without the commonest necessities of life, and he tries to throw the blame on the Railway Company, which, without having ascertained how it could be done, he took for granted ought to carry all they could want. It must, however, be remembered that the civil power at once found itself supreme beyond what is ordinarily the case in war, and destitute of the machinery which it usually possesses for aiding the operations of armies. The generals outside Paris could form no conception of the plan of war as a whole, as they were not in communication with TROCHU. A great general like NAPOLEON would have insisted on having all messages from Paris sent to him, and would have taken care that all messages sent to Paris should emanate from him. But there was no one at all like NAPOLEON among the generals who commanded after Sedan. There was no one of note or fame amongst them. They had not the confidence of the army or of the country. They were all much on an equality, and M. GAMBETTA therefore organized and conducted the campaign because there was nobody else to do it. He could only work with the instruments he had at hand. There were no experienced, cautious, energetic subordinates to be found after the collapse of the Imperial Government at Paris and the disasters of Sedan and Metz; and those whom he did employ were at least very energetic, if they did not know much and were not careful to keep strictly within the limits of their authority.

Nothing can be more obvious than that, had it not been for M. GAMBETTA, there would have been no resistance to the Germans outside Paris at all. Had France stood by the Empire even after Sedan, or had it been possessed by such a desire for a BOURBON restoration that it had immediately called one of the exiled princes to the head of affairs after Sedan, there might no doubt have been some one whose name is now unknown to fame who could have done, on behalf of the Government he served, as much as M. GAMBETTA did under the Republican Government which in point of fact was established. But, as things happened, it was M. GAMBETTA, and he alone, who made possible such resistance to the Germans as was offered. He committed a thousand mistakes, but the evidence given before the Commission shows that there was no general who had a plan of campaign in the probable success of which he believed, and that the plans of other persons may be criticized with quite as great severity as those of GAMBETTA. It was, as is now known, the plan of TROCHU to make his great sortie, not on the side of the Marne, but down the valley of the Seine, in order that Paris might be revictualled from Rouen and Havre; and in his evidence General Ducrot approves of this plan, and says that it was only

abandoned in deference to the foolish notion that the Army of the Loire was approaching, and that Paris must hold out a hand to meet it. General d'AURELLE, when examined before the Commission, took the opportunity of speaking his mind as to this scheme of a sortie down the Seine, and no language could be stronger than that in which he criticized its grotesque absurdity. He had taken the trouble to make a series of calculations showing how many men and animals must have been engaged in the operation, and how inevitably they would have fallen into the power of the enemy if they had made the attempt. None of the blunders of GAMBETTA or his subordinates seemed to General d'AURELLE half as ludicrous as the gigantic blunders which TROCHU and DUCROT were prepared to perpetrate if they had had the chance. When, therefore, it is said that M. GAMBETTA and his subordinates interfered with the Generals continually, and often unwisely, although this is quite true, yet it must be remembered that none of the Generals believed that they could do any real good, and that the schemes which each formed for doing the little he thought possible often seemed absurd to others of their number. It was because there was one civilian who really believed in success, who formed such plans as he could, and insisted to the utmost of his power on having them tried, that France did make a four months' fight after Sedan. Thus much must be said in justice to M. GAMBETTA; but, on the other hand, this volume of evidence brings into the strongest relief the patience and good temper with which the Generals tried to carry out the tasks assigned them, the small degree of jealousy which for the most part they showed at the time, and their patriotic anxiety not to let the attempt to save the country fail because they did not like the men who guided them in making it.

THE COAL QUESTION.

THE able and judicious Report of the Select Committee on Coal, drawn by the Chairman Mr. AYTON, can have disappointed by its moderate or negative conclusions only unreasonably sanguine expectations. No inquiry was needed to ascertain that the causes of the dearth of coal, whether they consisted of the concert of masters or of workmen, or of the operation of the ordinary laws of supply and demand, were beyond the reach of legislation. Although one or two of the members of the Committee seem by the questions which they addressed to the witnesses to have contemplated as possible an arbitrary expropriation of the coal-owners, the Report, which was unanimously adopted, recommends strict adherence to the principle of freedom of trade, and "an inflexible resolution of non-interference on the part of the State." The more plausible suggestion of an export duty on coal is for good reasons definitively rejected. Some exported coal is used by English ship-owners, and much of the remainder aids in the production of commodities which are afterwards imported into the United Kingdom. The Committee also forcibly remark that the recent excess of demand for export applied, not to coal, but to iron. Every ton of pig-iron represents three tons of coal consumed in the process of smelting, and every ton of rolled iron three additional tons. Unless, therefore, the exportation of iron were discouraged, the desired effect of lowering the price of coal by an export duty would only be produced to a comparatively trifling extent. As far as the more important question of production is concerned, it is evidently impossible to place an artificial limit either on profits or on wages. Since Parliament can do nothing to cheapen coal, political pedants might object to the appointment of a Committee for the mere purpose of collecting information; but it is not a waste of time to contribute to a better understanding among different classes, by means of a clearer comprehension of their motives and conduct. The evidence fully justifies the statement of the Committee that "the real order of events has been the rise in the price of iron, the rise in the price of coal, and the rise in the rate of wages." Indirectly the rise in wages has, by its effect in shortening the hours of labour, largely tended to maintain the high price of coal; but the prospects and growth of the iron trade are primarily responsible for all the disturbance which has occurred in the coal market. The Committee acquit the coal-owners of the charge of having combined to raise the price of coal; and while they express regret at the desire of some of the workmen to restrict the storage of coal for future consumption, they add the statement that some of the witnesses

who have appeared on behalf of the workmen disclaim the opinion that an accumulation of stocks ought to be discouraged. For the moment the question possesses no practical importance, because every coal-owner is using his utmost efforts to keep pace with the demands of the market.

The Committee prudently abstained from any attempt to ascertain the profits of the coal-owners since the rise in prices; but the witnesses who were engaged in the business candidly admitted the magnitude of their gains. Mr. ELLIOT, member for North Durham, who is largely interested in coal in the North, in Staffordshire, in South Wales, and in Nova Scotia, informed the Committee that, although during thirty years the coal trade had been comparatively unremunerative, a year or two more of the present prices would redress the balance by giving a fair average over the whole of the period. The price is, as Mr. ELLIOT readily admits, too high; but he holds out little hope of an early reduction. "It is unnatural," he says, "that a person investing in the coal trade should be making such a large profit as he is now." In other words, capitalists have a strong inducement to engage in the business; and, if the production is consequently increased, the price of the commodity may perhaps be gradually reduced. Canada, which now consumes a large quantity of English coal, will probably hereafter derive its supply from Nova Scotia; and steamships trading to America, to the Black Sea, and to China will probably become more and more accustomed to coal abroad for the homeward voyage. A larger diminution of the demand might be caused by an interruption of the prosperity of the iron trade. Some part of the recent activity has been produced by the necessity of improving every kind of machinery which affects the consumption of fuel. When the alterations are completed the special demand will be withdrawn, and the proportionate consumption of coal will at the same time have been permanently diminished. The Committee exhibited a sound discretion in not attempting to solve complicated and speculative problems. A small excess in the demand over the supply may sometimes cause a large advance in price. In the opinion of some of the witnesses, the expansion of the iron trade in Middlesborough alone, and the strike of the South Wales colliers in 1871, would together almost sufficiently account for the entire rise of prices. The consumers are also paying the cost of the provisions of Mr. Bruce's Mines Regulation Act of 1871. They have not only to bear the losses which arise from strikes, but to secure the coal-owners against possible strikes, and to compensate them for the diminution in the hours of labour. In the case of new lettings the owners of mineral property will probably be able to make advantageous bargains; but they are sometimes in their turn hampered by exorbitant demands for way-leaves when their access to railways is impeded by the caprice and imperfect information of Parliamentary Committees.

The most interesting part of the inquiry related to the demands, the condition, and the conduct of the working colliers. If the representatives of the Trade Unions may be trusted, the influence of these associations is habitually employed in favour of steady and regular labour during the reduced hours of work which have resulted from the high rate of wages. Although extravagance and intemperance are not uncommon, it would appear that the standard of comfort has been raised, that the children are better educated, and the houses better furnished, and that some of the men save considerable sums of money. One or two witnesses indeed assert that in Northumberland the collier "is not a gentleman as he was thirty years ago," but the alleged change for the worse is fully explained by the immigration of strangers among the hereditary mining population. The employers, with scarcely an exception, speak of the workmen with creditable candour and good feeling; and some of them think that a reduction in the hours of a severe and exhausting kind of labour is not unacquired. Mr. ELLIOT expresses a wish that the experiment of co-operative mining should be tried with the aid of the large capital accumulated by some of the associations of working colliers. He says that he has collieries which he would willingly let them have for the purpose; and that he would give them ample time for payment, and assist them in every way. A majority of the coal-owners who give evidence refuse to favour the plan of arbitration which was strenuously advocated by Mr. MANNING, a member of the Committee. The leaders of the Unions, as might be expected, announce in their reports a system

tem, which virtually recognizes their claim to a share in the profits earned by capital. The Committee, with its customary prudence, pledged itself to no definite conclusion on the subject. The more cautious witnesses confessed their inability to understand the basis on which arbitration was to proceed. If wages rise with profits, they ought also to fall in the same proportion; and yet it is evident that a workman requires a certain minimum of wages for his subsistence. According to Mr. ELLIOT, the average profit of coal lessees during nearly thirty years scarcely exceeded five per cent. The rate is now perhaps forty or fifty per cent.; and the collier earns eight or ten shillings a day. If the former state of things were restored, it would be impossible that wages should be reduced in the same ratio as profits.

Mr. NORMANSELL, Mr. MACDONALD, and other representatives of the associations of workmen generally profess their desire to deal with employers united in similar combinations. The masters, it is true, derive strength from union; but, on the other hand, they recognize by joint action the legitimate nature of the Trade Unions, and the official character of their representatives. During the South Wales strike of the present year, the chief contention of the ironmasters was for the right of each employer to negotiate separately and independently with his own men. In the result the demands preferred by Mr. HALLIDAY and the Miners' Association were practically conceded, but in point of form the men submitted to a nominal reduction, and the credentials of Mr. HALLIDAY were never acknowledged by the masters. Mr. LANDALE, an experienced manager of collieries in Scotland, assured the Committee that the uneasiness among the miners proceeded not from themselves, but from Mr. MACDONALD and other delegates, who, as he said, live by agitation. As might have been expected, Mr. MACDONALD earnestly denied the truth of the statement; nor is it either possible or useful to distinguish between popular feeling and personal influence. All unions of men, political or social, are directed by leaders who alternately impel the mass and submit to its pressure. As Trade Unions exist, delegates and members of Council must also be tolerated, with all the results which may attend their inevitable control over the decisions of the workmen. If a large body of colliers think fit to devolve the management of their interests on chosen agents, employers will probably find it convenient to recognize the delegation. In many cases, consultations among the representatives of employers and of workmen tend to prevent or to postpone collisions; but when the discussion takes the formal shape of an arbitration, the want of a basis for an award will sooner or later make itself felt. In seasons of prosperous trade, capitalists who are making large fortunes and workmen who are with much ease earning enormous wages will have strong reasons for avoiding a rupture. The consumer who pays for all is not represented at the arbitrations, nor was his evidence tendered to the Committee.

THE BANK FORGERIES.

THE virtual confession of two of the prisoners in the Bank forgeries case left the jury little to do. There was no doubt that MACDONNELL, NOYES, and the two BIDWELLS had all been concerned in the crime; the only question was whether NOYES and the younger BIDWELL had understood the nature of the transactions in which they were engaged. The jury thought that guilty knowledge was fully proved against them, and the judge saw no reason to make any distinction in their sentences. Humanity, like honour, may sometimes be found among thieves, and the two prisoners whose guilt was unmistakably proved showed considerable anxiety that their companions should be let off with a lighter sentence, even if they did not escape altogether. Perhaps some persuasion had in the first instance been necessary to induce AUSTIN BIDWELL and NOYES to join in the enterprise, and in that sense the responsibility of MACDONNELL and GEORGE BIDWELL may have been the greater. But there is nothing in the evidence to show that when once embarked in it there was any difference in the zeal with which they played their several parts. So much of MACDONNELL's speech as referred to himself was directed to show that the counsel for the prosecution had assigned too early a date to the first conception of the scheme. He reminded with something like indignation the charge that he had come over from America with an intention of committing a forgery on the banks of England. It was not, he said, until he had been some time in England that he conceived the

discount are not, as in America, sent round to the acceptor to be "initialled," that the possibility of forging bills of exchange presented itself to him. As, however, he immediately telegraphed to a friend that he had made a discovery of great importance, it was clear, even apart from the facts that have since been made public, that the idea of forgery was sufficiently familiar to him, and the *a priori* probabilities of the case are certainly on the side of the prosecution. The story as it came out in the evidence was this. In the spring of 1872 AUSTIN BIDWELL ordered some clothes of some tailors, named GREEN, living in Savile Row, and asked if he might leave some money with them while he was in Ireland. Mr. GREEN declined to become BIDWELL's banker, and instead introduced him to his own bankers, the Western branch of the Bank of England. BIDWELL at once opened an account with the very respectable payment of 1,200*l.*, and he soon followed this up by a further remittance of 1,000*l.* In September it was further increased by the proceeds of 8,000*l.* worth of Portuguese Three per Cent. Bonds. Having thus established their credit with the Bank, the confederates began to present genuine bills to be discounted. These bills had been bought by them in various European cities, and before being presented to the Bank they had served as models for the forged bills which they intended to present later on. By the 21st of January they thought the Bank had been sufficiently accustomed to the sight of their paper to make it safe to begin work, and on that day the first batch of forged bills was sent in and discounted. By the end of February 102,217*l.* had been made in this way, and, but for the accidental omission of a date, which led to a bill being sent to the supposed acceptor to have the oversight rectified, there would have been ample time before the bills became due for the prisoners to have made their escape. They had, as they thought, made it impossible for the proceeds of the fraud to be traced into their hands by a process of double exchange, first of notes into gold, and then of gold into notes. By this means, and by the number of different names and characters they had assumed, they no doubt hoped that their identity with the authors of the forgeries would remain unknown.

"Fraud," said MACDONNELL, in his speech to the jury, "though a very wretched, unhappy, miserable, and contemptible art, may be to a certain extent called an art 'nevertheless.' It is difficult to believe that this depreciation of his own pursuit was genuine. It is far more probable that the excitement and danger with which the execution of the scheme was surrounded had blinded the conspirators to its real character. There is something almost heroic in the idea of coming over to London and there turning a small capital into a large one by a series of forgeries clever enough to deceive such practised eyes as the officials of the Bank of England. It wanted something of this sort probably to supply the necessary motive. Desperate men will undertake desperate enterprises for the mere sake of getting money. They will not work, they are too proud to beg, and they take to robbery as the only alternative. But these men were not desperate. Previous forgeries had supplied them with a moderate capital which in the ordinary course of business would have yielded them enough to live on, and it is doubtful whether the desire to become rich would alone have sustained them in all the difficulties of their undertaking. The love of exciting adventure and the pride of successful adventure is seen in the letter written by GEORGE BIDWELL while he was flying from the police. He describes how 'his nerve has stood him through two taps on the 'shoulder and four encounters,' how he 'has been a 'Fenian, a priest, a professor, a Russian who could 'speak 'only verree little Engles mais un pen de Français 'et Allemand,' a deaf and dumb man with a slate and 'pencil—all in the space of a week.' Something of the pleasure which evidently underlies this description was to be gained at every step of the scheme. The same qualities seem to run in the BIDWELL family, at least if the brother JOHN BIDWELL is the author of the plot to get the prisoners out of Newgate, if not out of the very Court itself. Most men would have thought a well-guarded prison in the very heart of London too unpromising a field to be worth the trying. The BIDWELLS thought differently, and the result had almost justified their faith in the power of money in daring hands. A bribe of 1,000*l.* is supposed to have been too much for the honesty of one at least of the warders, and the extent of the precautions taken during the later days of the trial, and continued down to the moment of passing sentence, show, at all events, that the authorities

did not to the last think it impossible that a rescue of some sort would be attempted.

The whole case is too remarkable and exceptional to admit of any moral being drawn from it. It is one of those strange instances in which individualism occasionally asserts itself even in crime. America is just the country to furnish criminals of this type, because there alone is to be found the combination of large mercantile transactions with a state of society in which men still carry their lives in their hands. The scheme of getting one hundred thousand pounds from the Bank of England by means of forged bills might have suggested itself to the brain of a Londoner, but a Londoner would hardly have had the nerve to carry the idea out. In America the clerk who is sitting at a desk in New York to-day may next week be collecting debts in California, or making inquiries in Mexico. Under such conditions as these men learn to depend on themselves, and to believe that everything is possible to coolness and daring, to a degree which is hardly attainable in communities where civilization is more universally diffused. As regards the morality of the act, it is really no worse than some which have met in America with very different treatment. There was not one of the scoundrels concerned in the Erie swindle who did not deserve as severe a punishment as any of these forgers, and the generally lax tone of American comment on the proceedings of Mr. JAY GOULD and his fellow-criminals may well have led the BIDWELLS and MACDONNELL to think that success was all that was required to secure them immunity against disgrace, even if their plans for disarming suspicion should not do all that they intended them to do.

The Bank of England has been so heavy a loser by these frauds, that the best attention of the Directors will no doubt be given to devising precautions against a recurrence of the crime. Of course there is one great safeguard in the fact that nothing but a very long preparation could have disarmed suspicion, and a very long preparation implies that there is an amount of skill and capital at the command of the forger which is not very often met with. Still in the hurry of business even such frauds as these soon slip out of remembrance, and if equal ingenuity were directed to a similar object ten years hence, it is far from improbable that it might have much the same result. The manager of the Western Branch will perhaps in future be more likely to refuse a genuine bill than to discount a forged one, but managers who have not had his painful experience may be less cautious. What precautions ought to be adopted to ensure the Bank against deception is a matter for experts to settle, but it seems clear that when a succession of bills are presented by a customer having no recognized position in London, some steps ought to be taken to ascertain that the acceptances are genuine. After this startling proof of the necessity of some such process, no offence can possibly be given by laying down a rule to this effect for the future. Whether MACDONNELL's assertion that the absence of such a rule first suggested the forgery to his imagination be true or false, it certainly ought not to remain possible for any future criminal to make a similar statement.

ACCIDENT UPON ACCIDENT.

THE Retford railway accident is an occurrence of a much simpler type than its predecessor at Wigan. It is not yet known how the engine-driver will explain his apparent disregard of signals, but that the disaster was caused by his disregard of them seems scarcely open to question. No doubt the conditions under which the Great Northern line crosses the Manchester, Sheffield, and Lincolnshire line at Retford are unusually favourable to collision. The case with which trains are now taken up very steep inclines has not induced either Company to carry its rails across the other line by means of a bridge. The traffic from East to West and from North to South passes over the same spot at a level, so that the safety of the passengers depends entirely on the accuracy with which the signals are worked, and the care with which they are watched. In this case, two trains proceeding at right angles came in contact just at the crossing. The passengers by the train going East had seen the train approaching from the North, and expected that it would stop until they had passed. Instead of doing this it came on at a rapid rate, and cut the other train in two. Two days later, at Dodworth, also on the Manchester, Sheffield, and Lincolnshire line,

another excursion train was run into by a goods train, the driver of which had been unable to see the signal owing to the fog. At Eastbourne, a day earlier, two trains, which have to run for a short distance over the same rails, were both late, and came into collision. Here, therefore, were three accidents from the same, or nearly the same, cause within four days. There is no mystery about this class of railway disaster. In all these instances alike we have an overcrowded and unpunctual traffic, which necessarily leaves the lives and limbs of the passengers to the mercy of an overworked signalman or engine-driver. As regards railway travelling, a dark winter night is not half so dangerous a time as a bright August day. At this season the Railway Companies seem to set no limit to the number of trains they are prepared to run, except such as may be imposed on them by the amount of their rolling-stock. Tourists going off to Scotland, families going to the seaside, excursionists pouring out of the great towns to the nearest bit of woodland or coast—all these classes of travellers want to be accommodated at the same time, and the Companies have not the heart to refuse any one of them. Towards every junction therefore trains are converging at all hours, and there is nothing but the signals to preserve even the minimum of necessary interval between them. But no matter how perfect the system of signalling may be, it has to be interpreted at very short notice by men who as often as not are in urgent want of rest and sleep. Any one who will think for a moment what mistakes he has made when thoroughly tired out with work will be inclined to wonder that the drivers so rarely misread or neglect a signal, and that the signalman so rarely sets the wrong arm in motion or shows the wrong lamp. A recent accident on the Great Western line near Salisbury was admitted by the station-master at Wilton to be caused by first telegraphing to Salisbury that the line—a single one—was clear, and then, in a moment of forgetfulness, sending a train on. "In answer to inquiries," says a report of the Coroner's inquest, "he added that, in addition to the duties of 'station-master, he had to attend to all the accounts, to 'issue and collect tickets, to attend to the telegraph and 'to all trains, and that his hours were from six in the 'morning to half-past nine, and sometimes later at night, 'with only one porter to help him." Even an ordinary working day of fifteen hours might not have made him lose his head, but on the day before the accident there had been a great fête in Wilton Park, "and he had been very 'much harassed, having had a great deal of work to do"—meaning evidently extra work. Whatever verdict the coroner's jury may return, no reasonable person can doubt that the station-master's employers, not the station-master himself, are to blame for this accident; and it has yet to be seen how far similar causes have been at work at Retford and Eastbourne.

There are three conditions under any one of which railway travelling in August might conceivably be safe. One is that the Companies should run no more trains than their present servants can properly attend to. A second is that there should be no level crossings, and no part of the line on which trains going in different directions can ever meet. A third is, that, supposing the number of trains and the dangers of the crossings to remain what they are, the staff of servants should be large enough to ensure that every one of them may have all his faculties about him during the whole time he is on duty. If the first of these precautions were observed, the interval between trains going in the same direction would be considerable, and, though junctions would still be a source of danger, yet the punctuality with which the trains would be able to travel would allow of the distance of each from the point of possible contact being accurately calculated. If the second condition were observed, collisions would be very much rarer, because they could only happen when a train had been accidentally sent on to a line with which it would properly have no connexion. At Retford, for example, if there had been a bridge, and at Eastbourne, if there had been a different line of rails for trains having different destinations, the accident would have been altogether prevented. Even if the Companies were to establish their right to neglect both these safeguards, the worst consequences of the omission might be remedied by a very vigilant staff of servants and officials. Imperfect machinery thoroughly well worked may be safer than better machinery in the hands of less competent men. There is not one of these suggestions which might not be carried out in almost every case, supposing the Companies were willing to have

recourse to them. As it is, they neglect all three. They overcrowd their lines; they make the same line of rails do double duty; they work their servants till they lose their wits from sheer fatigue. And every one of these acts of wilful carelessness is committed with perfect impunity, except from damages. Parliament seems quite unable to devise any means of compelling Railway Companies to do their duty. We know as each summer comes round that the same accidents will happen from the same causes. And yet we are powerless to make the Companies take the necessary steps to guard against them.

In this state of things Lord CAMPBELL'S Act is the only plank we have to cling to. It is easy to find fault with it. It is easy to say that it bears hardly on the Companies because juries have, as a rule, more sympathy with the travelling public than with the shareholding public, or that what a railway passenger wants is protection for his life, not compensation to his representatives for his death. But so long as no other law bears on Railway Companies at all, and so long as compensation for death is the nearest attainable approach to protection of life, it is of the utmost moment that Lord CAMPBELL'S Act should be retained in its present form. We grant that it dispenses but a very rough justice; but even rough justice is better than no justice at all, and, little as Railway Companies seem to mind the prospect of heavy damages, they would mind immunity from heavy damages a good deal less. We should much prefer seeing some machinery in force by which the Companies should be compelled to adopt every approved precaution against disaster; and in that case we readily admit the responsibility for accidents would be removed from the shoulders of the Railway Directors to those of the department which had allowed a necessary precaution to be omitted. But we have not got any such machinery, and in the present temper of Parliament there does not seem to be much chance that we shall ever get it. Railway travellers, though a very large, are a very unorganized body, and the consequence is that in the House of Commons they are absolutely powerless. This was shown very clearly in the debates on the Railway Traffic Act Amendment Bill last Session. So long as it was a question of forwarding goods in safety to their journey's end the railway interest found that it had energetic adversaries to contend against. But as soon as an attempt was made to make some provision for forwarding passengers in safety to their journey's end, the railway interest had everything its own way. Probably it would now be impossible to pass such a measure as Lord CAMPBELL'S Act. But, as by a happy chance we are in possession of it, it only remains to take care that it is not in any way tampered with. Year by year there will necessarily be less and less competition between Railway Companies, so that the chance which we might otherwise enjoy of having greater safety in travelling held out as an inducement to prefer one line to another is denied us. Throughout a great part of the country railways possess a monopoly of the means of locomotion. The only choice left is the choice between travelling by railway or staying at home. The Companies are perfectly aware of this fact, and they show their knowledge of it by their studious disregard of the comfort and the safety of their passengers. Instead of the public being their customers, they are their serfs. Nor is the prospect an improving one. The increase in the working expenses of the several lines consequent on the rise in the price of coal and iron must be met somehow, and the most natural way to meet it is by carrying more passengers, employing fewer servants, and introducing no improvements. The Board of Trade can do little for us, for, though it can point out the cause of an accident, and suggest means of preventing its recurrence, it cannot insist on its advice being taken. The very day that the Wigan accident happened the surviving carriages of the tourist train were nearly run into because their engine broke down, and there was no means of signalling to the driver of the Limited Mail. Yet, if the suggestions of the Government Inspectors had been attended to, this source of danger would long ago have been removed. These are the facts which justify juries in giving heavy damages against Railway Companies. If they cannot be forced to make railway travelling safe, they can at all events be made to feel that leaving it unsafe costs money. If they could once be taught that a low death-rate means a high dividend, avoidable accidents might become as obsolete as stage-coaches.

SPORTS AND STUDIES.

A COMPLAINT which is rapidly becoming rather commonplace cropped up in the *Times* the other day. An "Officer of the Army with Limited Means" complained of the present system of exalting the importance of athletic sports as compared with the studies which are still conventionally supposed to be the main occupation of schoolboys. The Officer's point of view was perhaps not the highest, but it had the merit of being intelligible to large classes. He thought it very hard that, whereas he paid for Latin and Greek, the article actually delivered was adulterated with rowing and cricket. His explanation of the phenomenon was in accordance with this view of the evil. Schoolmasters, he said, let their boys play because they escape a great deal of drudgery. A master at a public school often receives a very large income; and if he were compelled to provide his boys with a corresponding amount of knowledge, he would either have to incur a much greater expense, or to work very much harder for his money. Therefore he behaves like a dishonest tradesman, and, instead of teaching the boys, allows them to amuse themselves, and then dignifies the amusement by a free use of the vocabulary of the muscular Christians.

This theory will of course be indignantly repudiated by the high-minded gentlemen who have the charge of our youth. Whether some infinitesimal grain of truth may lurk in it is more than we can say offhand. It is conceivable that the natural indolence from which schoolmasters are no more exempt than any other class of the population may incline them to look with undue favour upon a system which certainly lightens their duties. Nobody, however, who knows them will deny that schoolmasters, as a rule, are a very hard-working set of men; and it would be the grossest injustice to assert of any of our greater schools that the masters are consciously moved by such sordid considerations as those suggested by their military critic. It is pardonable in a father who finds that his son cannot construe a line of Greek, but can run a mile in four minutes and a half, to be rather irritated at the turn things have taken; and it is not surprising that he should deal in random accusations. Schoolmasters may profitably turn his remarks to account by looking at themselves with the eyes of the ordinary parent. We, however, can by no means accept his doctrine as final, or place the whole responsibility upon the shoulders of a deserving body of men.

To say the truth, the question whose fault is it? is about as useless here as it is in most cases. It is very convenient for parents to say that the wicked schoolmaster gives a bad article because he is idle or avaricious. The schoolmaster can, of course, retort with equal plausibility that the parent is the real source of the evil. Theoretically, a school is what the master makes it; practically, it is very much what the parent wishes it to be. The schoolmaster can only deal with the material supplied to him. Boys who have been brought up in idle luxury for fourteen years cannot be drilled into intellectual activity in the four or five following years. The ultimate appeal is to parental authority. If the average father cares very little for learning, he will not back up the schoolmaster's efforts at raising the standard of study. The same people who cry out against the laxity of discipline are roused to indignation if their own lads are stinted of amusement or exposed to any kind of hardship. Too much importance, it is generally admitted, is attached to cricket; but, if the head-masters venture to draw the moral that the public school matches should not take place according to precedent, a thrill of indignation passes through the whole country. If schoolmasters are to be regarded from the tradesman's point of view, it must be admitted that they will generally supply that kind of article which their customers desire. The application of this principle to particular cases is only too obvious. Why is a boy sent to a public school, as a general rule? Various answers may be given; and amongst others the obvious one that a boy is a trouble at home, and that whatever may be the faults of public schools, private schools are generally worse. When, however, this statement is examined a little more closely, it generally bears one meaning. A boy is not sent to school to learn, but to gain certain supposed moral and social advantages. If the father is a snob, the boy is sent to keep company with lords; if the father is an ordinary English gentleman, the boy is sent to get that kind of polish which for generations has been held by his class to be as essential as a power of discriminating between the proper uses of knives and forks. A phrase incidentally used by our military friend perhaps lets out the secret. He states it as a primary axiom that every parent, whether millionaire or poor professional man, "must in self-defence place his son at the same style of school to insure him a fair chance of success in life." Very many parents consider that the first requisite to success in life is the habit of associating freely with millionaires and their sons. They would, if possible, get teaching too; but the first demand is that their boys should go to the same schools with the sons of men of wealth and rank. When that is a predominant passion, it is not surprising that the prevalent tone at the schools should be determined by that prevalent amongst the children of the richest classes; or, in other words, that boys should be as eager to learn how to amuse themselves as to learn how to make an honest living by their brains. The public schools, again, set the tone for their humbler rivals; and thus the schoolmaster has to contend, not merely against the natural *inertia* which nine schoolboys out of ten oppose to learning, but against all the home influences which teach boys to consider success in life to involve the adoption of the habits of millionaires.

So much may be said as regards the attempt to localize the responsibility. That schoolmasters might do much to stem the current which now runs so strongly towards athleticism is undeniable, but they will be fighting at a great disadvantage until they are backed up by a vigorous body of public opinion. The general tone of feeling upon the subject requires a good deal of bracing, and there are fortunately signs that people are beginning to listen to reason. The old commonplaces are indeed put forward as an answer to very reasonable complaints. Athletic sports, it is said, have many good effects upon mind and body; the boy who plays best works best; and so on. We should be the last to deny what is true in those statements. We believe that a love of manly exercise is an excellent thing, and, so far as the desire for athletic sports is a result of the increasing prominence of town life and sedentary habits, we may admit it to be useful. So large a proportion of the population is now confined within city walls, that it is highly desirable that every healthy mode of physical exercise should be encouraged. But we object to its excessive development as decidedly in the interests of sport as in the interests of study. Under the present system play too often ceases to be play, and becomes a profession. In that case its effect on the body is as questionable as its effect on the mind. A daily constitutional and an occasional walking tour improve the digestion and clear the brain; a course of training which qualifies a man to do seven miles an hour is a severe strain on his constitution, and reduces his brain to be a mere machine for judging paces and making bets. We need not enlarge once more on the degrading tendency of every sport as soon as it has ceased to be a friendly rivalry between the boys themselves, and has become in a manner public property for the benefit of well or ill dressed London mobs, and even of the betting-ring. When athleticism is developed after this fashion, the saying about the best worker being the best player becomes the very reverse of the truth; the two pursuits are simply incompatible; but we could not ask for a better test of the utility of athletic sports than that which this doctrine supplies. So long as it was really true that a schoolboy or an undergraduate could excel in both capacities, it is presumable that he has pushed neither pursuit to an excess. When devotion to one practically excludes excellence in the other, as has long been the case, it is evident that his education is of a one-sided, and probably of an injurious character. The question is not, as the advocates of the present system insist upon stating it, whether boys are to be encouraged to play cricket or to over-eat themselves in confectioners' shops, but how the athletic mania which is now prejudicial both to sport and to study is to be kept in due subordination. The singular growth of that mania within the last fifteen or twenty years is probably due to various causes, some of which are unluckily difficult to attack. Partly, as we have already admitted, there is an element of real common sense in the movement, though it has been overlaid with mountainous heaps of nonsense. Something must perhaps be put to the account of the national growth in wealth and luxury which has made the great schools of late years too prosperous to be anxious for serious reform, and which has perhaps filled them with a class more anxious for the society of millionaires than for the acquisition of classical knowledge. Then that intense *esprit de corps* so characteristic of our great schools has prevented them from lowering themselves by any active competition with crammers; whilst the crammers, profiting by the increase of open examinations, have drained off the boys who really want to learn something. What was to be, in the calculations of its originators, a great impulse to education, has in fact left the general system of education pretty much as it was before, though it has led to the growth of a subsidiary system of very questionable merit. And thus, by an ingenious division of labour, one set of boys have their brains, whilst another have their muscles, overworked; a system which is hardly calculated to turn out very admirable results. We do not, however, profess to investigate in a few lines the causes of this curious current of popular feeling. When mankind by any accident get a new idea into their heads, they are apt to allow it for a time to exclude all others, and thereby make a half-truth as dangerous as a complete blunder. The protests which have been excited by recent excesses will, it is to be hoped, do good in time; and after the schoolmasters and the parents have been content with handying the responsibility backwards and forwards, they may perhaps agree to make some joint efforts to diminish an acknowledged evil.

ARCHÆOLOGICAL EXCURSIONS.

FOR some reason which it would not become us to guess, the doings of the British Archæological Association are always chronicled in the *Times* at much greater length than the doings of the Archæological Institute of Great Britain and Ireland. There are mysteries about these things which the initiators alone can understand. It certainly is not because, as some people hint, perhaps, not without truth, the proceedings of the Institute are falling off. For the distinction of which we speak has been made for years, long before the proceedings of the Institute had at all begun to fall off; and if they have fallen off, they have at least not fallen to the level of the proceedings of the Association, at all events as reported by the *Times* itself. We trust, for the sake of Mr. Edward Roberts, whose discourse at Coningsburgh Castle the *Times* has reported at some length, that he has been reported very inaccurately; still the report is there; there is the idea which Mr. Roberts discourses

conveyed to the mind of somebody, and we cannot believe that any reporter could have been so dense as not to have carried off a clearer notion of things if the orator had been Mr. G. T. Clark. Mr. Roberts and his company got to Coningsburgh, which, according to the *Times*, "is an interesting ruin and must have been of great strength." This light-of-nature way of looking at things is the *Times*' own, and must not be laid to the charge of Mr. Roberts; but we seem to get a touch of the lecturer himself in what follows:—

The keep contains a chapel, in which Scott, in his *Ivanhoe*, represents that Athelstan's body was laid; but Mr. Roberts expressed a doubt whether such a coffin as he would have had could have obtained ingress; indeed, he thought the castle was not erected till 1188-90.

It would seem that Mr. Roberts, or his reporter, or somebody or other looks on *Ivanhoe* as a true history, or at any rate as something so nearly approaching to truth as to make the probability or possibility of any part of the story worth disputing about. It is something that Mr. Robert "thinks that the castle was not erected till 1188-90," for some people have thought that it was built by Cartimandun; but the point is that it is plain that *Ivanhoe* has been brought into a grave discussion on Coningsburgh Castle as something other than a joke. And this alone is worth recording in the history of the human mind. If Mr. Roberts told his hearers anything of the true history of Coningsburgh, it made no impression on the mind of the *Times* reporter. People with their heads full of *Ivanhoe* are not likely to think much of Domesday. If they would deign to turn to the great Survey, they would find that, a hundred years or more before the present castle was built, its site, marked doubtless by some ruder fortress, was a possession of Earl Harold, and passed by the gift of the Conqueror to William of Warren.

One might be curious to ask how many of the people who talked about *Ivanhoe* on the site of the house of Harold believed, if they overheard of it, that the fight of Brunanburh was won by the "unready" hero of the fable. Chronology need not stand in the way. Cedric in 1194 is not a very old man, and his father was not a very young man when he fought at Stamfordbridge in 1066. After this, a century or so more cannot much matter, and the leap back to Brunanburh is easy. But presently we get some historical criticism:—

A tumulus in the vicinity is traditionally deemed the tomb of Hengist, but probably few antiquaries now believe in Hengist's existence.

Whatever antiquaries may do, historians do commonly believe in Hengist's existence, though they both know how to spell his name and are not likely to carry him into Yorkshire. Still we should like to know something about the "tradition," which, like most "traditions," is pretty sure to mean the guess of some one or other. But we must not forget that at Coningsburgh we have got within the elfin realm of the Rector of Sprotburgh. Was not our old friend there? We trow not; surely neither Mr. Roberts nor anybody else could venture to hold forth about Coningsburgh in the presence of the man who has made Coningsburgh his own. And against one of the errors of *Ivanhoe* Mr. Surtees would be quite guard enough. Mr. Surtees of course does not believe that Stamfordbridge is Stamfordbridge; if he did, he would not be Mr. Surtees. But Mr. Surtees happily lives in Yorkshire; so the great fight is at least kept within its own shire; while Mr. Roberts and the votaries of *Ivanhoe* most likely still think that it was fought by the banks of the Welland.

We had wandered thus far from the walls of Exeter, though we had been brought back by another road to their great builder in the tenth century, when we were suddenly awakened to the fact that we were still in a state of war with the *Pall Mall Gazette* about his doings. To be sure the critic who so jauntily took up Athelstan and his acts in the interval between "London task-work" and "the serious business of sporting" "hardly expects readers in general to take an interest in so antiquated a controversy," or "in that field of remote speculation." We can only say that it was he himself who began the controversy of which he now speaks with so convenient a contempt. We need not go through the dispute again, as we should only have to say the same thing over again; but one or two points are amusing, as showing the way in which men can evade evidence which tells against them. The *Pall Mall* critic affirmed that William of Malmesbury gives no suggestion that he used lost sources for his history of Athelstan. We showed that he distinctly referred to lost sources. Our disputant answers that we had turned three sources into four, that the sources were worthless, and that they did not bear on the particular question about Exeter. We admissions of these answers; but if we admitted them all, they would only prove that the sources to which William referred were untenable, whereas the proposition which we attacked was that he referred to no sources at all. This curious forgetfulness of that point at issue is, not unhelpfully, designed by our critic to "point the very moral of our discussion." He then goes on to say:—

That Athelstan may have visited Exeter we have not doubted, and cannot think why the critic chooses to mention with a variety of charter paragraphs to prove it. It is a very easy case that Exeter was, in the time of that monarch, a long-settled West-Saxon city, and may, of course, have often received its Saxon ruler within walls which he is commonly (and very creditably) asserted to have built.

That Exeter was in the days of Athelstan a long-settled West-Saxon city, as is shown by its mention in the days of Alfred, is just as much a part of our case as of the case of our adversary. It is implied in the very words of William of

Malmesbury, only he implies further that there was in Exeter then, as in many Welsh towns ages after, a Welsh as well as an English quarter. But the critic "cannot think" why we quoted various passages which prove a special connexion between Athelstan and Exeter. We know not whether our adversary's London task-work is of a legal kind; if it is, he may have heard of a species of evidence well known to country justices, called "corroboration in a material point." Such evidence of itself proves nothing as to the main fact, but it often proves a great deal as to the credibility of the witness who asserts the main fact. William of Malmesbury asserts that Athelstan did certain things at Exeter. His credibility is attacked and sneered at by a critic who puts him on a level with Geoffrey of Monmouth. We answer that, though there is no other direct witness to the fact, yet there is a large amount of independent and incidental evidence pointing to a state of things such as we should look for if the statement made by William of Malmesbury were true. We have evidence that Athelstan, and Athelstan alone, as far as our evidence goes among our early kings, had a great deal to do with Exeter, that he and he alone, in the language of the class of cases which we have in our mind, "kept company" with Exeter. This, though it proves nothing directly as to the alleged fact, proves a good deal as to the probability of the fact, and as to the credibility of the witness who asserts it. For the rest we have only to say that when the fact of the occurrence of undoubted Welsh names in certain districts is set aside as "scrapes of etymological conjecture," we can only say that the writer is very discreet in professing himself but little "affected by proofs of this nature."

We have quite rambled away from our immediate purpose, but such a vagabond process may not be unfit in an article which professedly deals with rambles, and we were really taken by surprise when we found that an adversary who we thought had fallen back into a discreet silence was once more in the field. However, he has carried us back to Exeter and Devonshire generally, which was where we meant to go, though not by quite so roundabout a road. The *Times* does not record that anybody laughed at the *Ivanhoe* talk at Coningsburgh, but most certainly a good many people laughed very heartily at some kindred talk at Totnes. There, on the great mound crowned by the shell keep which represents the fortress of the famous Judahel—the name is spelled a hundred ways—an ancient Briton stood forth to explain that the castle, or at least some earlier one on the same site, was the genuine foundation of Brutus, and moreover that the mark of the foot of Brutus was still to be seen in the street. This was asserted on the authority of "Forster's Chart of History," which, the orator added, "cannot be doubted." And as no one present had heard of the author who enjoyed this unique privilege, the believer in Brutus kindly explained that Mr. Forster lived in the Eastern counties, and moreover lived to be a hundred years old. Those who argued whether it were possible that the coffin of the mythical Athelstan could have been got into Coningsburgh chapel might have gone with all zeal to measure the foot of Brutus, but the more sceptical mind of the members of the Institute was satisfied with the judgment of some geologists present, that the relic was in truth a boulder with a hole in it. It might be worth a moment's thought whether the legend which thus specially connects Brutus with Totnes is purely arbitrary, or whether it arose out of any confusion with the occupation of the site by the Breton Judahel. Anyhow that occupation is one stage of the singular flowing backwards and forwards of the stream of conquerors and settlers between the greater and the lesser Britain. The Breton ruled at Totnes over what seems to have been a flourishing borough in King Edward's time, and he and his Norman tenants held the lands of a crowd of dispossessed Englishmen. The town is itself a hill-fortress, with the castle rising on a height above a height, a contrast to the position of another famous Devonshire site, where, almost suggesting the twin hills of Sitten, the castle and church—St. Michael's Church—of Okehampton, sit each on its height with the town at some distance at their feet. The *Ockenwone* of Domesday, the *Ockington* of local pronunciation, does not appear in the Survey as a borough, but we have the distinct entry "*ibi sedet castellum*." It was the fortress of the Sheriff Baldwin, the same who held sway on the Red Mount at Exeter, the son of Count Gilbert of Bretonne the guardian of William's childhood, and who must be carefully distinguished from the later Baldwin of Redvers, with whom he has sometimes been confounded in local history. A fine wild site it is that it occupies on the northern side of Dartmoor, as Totnes skirts the same bleak and lofty region to the South. But, though the present keep, on the highest point of the mound, is square, it is clearly not the building which is entered in Domesday.

In churches the excursions from Exeter were less rich than those of many meetings have been. The churches of Devonshire are for the most part inferior examples of the pattern which reaches its perfection in Somerset. Towers like those of Totnes and Collumpton would be wonderful in a midland county; in East-Anglia they would rank as distinguished foreigners; but beside Wington and Okehampton and North Petherton, or even beside Corstorphine, they do not count for much. But Devonshire is of all lands the richest in green-work, which at Totnes rises into a stone roodscreen and a loft which must have covered the whole choir. The collegiate churches of Okehampton and Crediton rise above the common type. Crediton has a stately minister-like outline, but the inside is disappointing, and disappointing it must always have

been in some measure, even before it was disfigured as it now is. Ottery, with its two side towers after the fashion of Exeter, is worth careful study as an example of a comparatively small church initiating a great one. In this process Continental architects were more successful than those of England. On the other hand, the great church of strictly parochial type, in no way imitating the minster, but just as good in its own way as the minster, is something distinctively English. Of Exeter itself, its buildings and its history, we have said all that we have to say long ago.

REPORT OF THE COMMISSION ON SCIENTIFIC INSTRUCTION.

THE Third Report of the Commissioners appointed to inquire into the state of scientific instruction, which has just been issued, deals with the condition of scientific instruction in the Universities. It is, as might be expected from the names of the Commissioners, wise and moderate in its tone. It is free from that querulousness, that sensitiveness as to whether their peculiar subject gets its full measure of appreciation, which has of late shown itself in the small fry of science, just as it did in that of literature before it was pooh-poohed out of existence by Mr. Thackeray. The Commissioners evidently feel that there is a certain arrogance implied in limiting the word science to their particular province, and "they desire at the very outset to guard against a possible misconception. Our use of the term science in this Report is limited, by the scope of the duties assigned to us, to the sciences of organic and inorganic nature, including under that general designation the sciences of number and magnitude, together with those which depend on observation and experiment." In the body of their Report, however, "science" is so used as to exclude pure mathematics, though that subject is comprised in the above statement.

The Report contains an account of the existing appliances for scientific teaching at the Universities, with various suggestions. The Commissioners find, they say, that "on many of the most important questions the evidence of the witnesses is on the whole characterized by a remarkable unanimity." We have ourselves in articles on the Universities adverted to this general convergence of opinion in particular directions as a very hopeful sign; it shows that great educational questions are being removed from the province of personal feeling and mere sentiment, and are approached in an earnest and genuinely scientific spirit. We can only touch on the portions of the Report which are of the most general interest.

The Commissioners desire that young men should be set free to follow their own bent in pursuing science at the Universities; it may be gathered from what they say that they have in their eye only those who have more than average ability and who would be candidates for honours. The "pass men," we suppose, do not come within the sphere of their observation. Herein their views agree with those prevalent at the Universities, and they admit that the condition of things at Cambridge does allow, and at Oxford easily might be made to allow, that after the first term a man may follow his own course. They think, however, that all should obtain some knowledge of a physical science—at Cambridge this is to a certain degree effected by the requiring of elementary mechanics from all students, while "pass men" must do Heat and Hydrostatics as well—but they intimate that they would be glad to see all the compulsory part of a student's work got through at school.

Here we pause awhile in pursuing the Report. Can we accept without reserve this notion of the day, that a young man after eighteen—for, though the Commissioners say that more students come to the University over nineteen than under, we have statements from Cambridge just to the contrary effect—that a youth of eighteen, we say, is to claim exemption from all further direction of his studies after some school examination, and devote himself to one subject? Our doubts are further increased when that subject is natural or experimental science. We hear, from Cambridge especially, that one of the bad symptoms is that young men are now overtrained for some special scholarship examination—it may be in mathematics, or it may be in natural science (the Commission says nothing of the numerous natural science scholarships at the colleges at Cambridge)—and that they are utterly illiterate in consequence. The specializing process begins too soon. We quite agree with Professor Adams in this. A boy has no mind for science, properly speaking, till he is at least sixteen; and if he is to qualify himself for a minimum in some branch of natural science before eighteen, it will often have to be done by leaving his general cultivation to take care of itself. But the minds of young people are best moulded, not perhaps by language, but by what language tells us of the doings and sayings of great men. It is the classical men in every school who form its intellectual life, who are known in its debating societies, who write for the *School Magazine*; so that we doubt whether this compression of all general education, including science, into the time below eighteen is not dangerous. In Germany, whence this "Leaving Examination" is borrowed, young men, it should be recollected, do not go to the University in general till they are twenty, and they go to school earlier, and when there work harder, than English mothers would at all permit. But we return, having eased our mind, to the Report of the Commissioners.

They advocate in consequence the introduction of a system of "Leaving Examinations" to be held at the schools and conducted by the Universities, the passing of which examinations should be

accepted in lieu of "Little Go." A plan for effecting such examinations is now being carried out by a joint Board of the two Universities; indeed, the term "Leaving Examination" was introduced in the discussion between the Universities and the masters. We have frequently expressed ourselves favourable to the carrying out of such a system, and have pointed out to the masters how much more that freedom which we consider to be of vital importance to all teachers could be maintained by their working in concert with the Universities than under a Government department. We have always maintained that such a system was better than a matriculation examination—first, for the sake of the schools, because in order to pass the latter boys will leave school to obtain special and very narrow instruction immediately directed to it, whereas by the other system the motive power of the examination is turned to account in giving life to the whole work of the schools; and, secondly, for the sake of the University, because a matriculation examination, that is, an examination on coming into residence—in which sense the matriculation examination at the London University is not a matriculation examination, but only the first examination of a course, like the "Little Go"—has many disadvantages which are pointed out in the Report, and one which is not so pointed out, though in the eyes of college tutors it is, it appears, a very strong one. Young men, it is said, come up from tutors, after some weeks of hard work, with every nerve bent on passing this examination; and when it is over and the burden is relieved, their nerves are altogether unstrung from the sudden withdrawal of the tension; they think they may give themselves a holiday after their work, and the holiday sometimes never comes to an end. At any rate it is bad for young men on first coming to the University to have their minds thus suddenly left in a state of vacuity by the withdrawal of an absorbing interest. The difficulty of the question, however, the Commissioners do not deal with. They speak as if all boys came from schools. But it has been found at Cambridge that one-third of the freshmen have not been to school at all, or only for a very short time. Among them many come from the colonies, some from America, and two or three yearly from India and Japan. What is to be done with them? We should think it sufficient to say that these must pass their "Little Go" in their first term; but it is alleged that this is putting them at a disadvantage when compared with the boys at schools, who, having got their general education done before coming up, will have more time for their particular study. Some open examination may be held to meet this difficulty; but then, if this be harder than the "Leaving Examination," the injustice remains; and if it be as easy, many boys will find that they will pass much more readily by leaving school and going to a crammer. We have in our own minds, we confess, a doubt as to the value of the knowledge which is supposed to be tested by an open pass examination. A boy gets much good from being well taught, apart from the actual information he lays up. The good which a boy got from being taught by Arnold did not lie in the Greek he brought away; and, on the other hand, he may be trained to carry a certain amount of information into an examination room and discharge it on paper, and in a day or two the knowledge will have disappeared from his mind, and it is not the better, but rather the worse, for the process it has gone through. The great value of a "Leaving Examination" lies not in the actual knowledge it indicates, but in giving a sanction to the teaching of the school. More good comes from the act of learning than from what is learnt, and we do not look to have a more scientific public opinion from the exaction of the "minimum" of science which is spoken of by the Commissioners. The difficulty we have mentioned does not exist in Germany, for there nearly all the boys go to gymnasias; they can hardly enter the Universities if they do not. A few noblemen and others obtain leave for their sons to pass the examination at the gymnasias though they are not pupils. Something of this kind might be done with us, but we do not see our way to maintaining the perfect equality which is demanded without doing some mischief to education; the "scientific culture" secured by an elementary examination unconnected with any particular kind of teaching would, we fear, come to mean the learning a portion of a manual which gives the nomenclature and the results of science. The difficulty is to get a boy's mind to follow any scientific process of thought, and to put these studies into such a definite shape that they may be made the subjects of lessons, so that a boy may be found fault with for not doing them. We cannot spare rigour from education just now. Improved science manuals are, however, in course of appearing, and the Cambridge Board of Natural Science Studies put out last June a sort of programme of study in each branch.

The Commissioners seem to be aware that they must have professors who shall not only lecture, but teach; two processes which are very different—different above all in this: that the professor only tells his hearers, but the teacher sees that they learn what he tells them; and for this purpose we find a new class of functionaries introduced called Adjoint Professors, who are to do for the University what college lecturers do for the colleges. They also recommend, as may be supposed, a considerable increase of the Professoriate proper in the scientific department, and they are inclined to make certain professors ex officio members of certain colleges. They say truly that it is very desirable to draw the professors into closer communion with the students and with the general course of teaching. The family feeling is, in truth, the strength of the college system, and the absence of it is the weakness of the professorial one. The complete absence of all personal

relations between professors and students in the German Universities is a defect often dwelt on by the students, and sometimes deplored by the professors themselves.

With regard to fellowships, the views of the Commissioners also agree pretty much with those which appeared in this journal at the end of December last. It is proposed—

- (1) That there be three classes of fellowships—senior, junior, and non-resident.
- (2) The senior fellowships to be permanent, and free from the restriction of celibacy, but subject, as a general rule, to the condition of residence in the University, and readiness to take some part in the work of the college or University.
- (3) That the election to the seniority should in ordinary cases be made from the class of juniors, but should not be limited to that class.
- (4) That the junior fellowships should be tenable for, say, fourteen years, and should be subject to such restrictions as to residence in college and duties as may appear desirable to the several colleges.
- (5) That the non-resident fellowships should be tenable for about half that time.
- (6) A junior Fellow may at any time transfer himself to the non-resident tenure, with a proportionate allowance for the unexpired term of his holding; so that, if he had six years to run, he might take a non-resident fellowship and hold for three.

The occasional election of men of science, of mature age, to the senior fellowships is contemplated. The three separate functions of the fellowship—that of providing the governing body, the educating body, and as stimulants to induce men to read for high honours—are here represented by distinct heads of tenure, most of which are in existence in Cambridge, where a considerable number of fellowships are held on limited tenure without the restriction of celibacy.

We fear that the proposal to impose the restriction of celibacy on the junior Fellows engaged in tuition will cause great disappointment to the younger reformers. "Why are we reformers at all," many may say, "excepting that we want to marry." On this point they take high ground; they find marriage early in life requisite to complete general culture; the dictates of culture take no refusal—it is fortunate that they so generally fall in with inclination. We, as impartial spectators, would say that there is no need to provide young college lecturers with the means of marrying before other people; the requirements, too, of the college may render their presence within the walls desirable, and if married men cannot live in college, a certain number of Fellows must remain single. The same restriction is practically imposed on some of the junior masters at schools; but we own that the junior Fellows should not be constrained to celibacy for so long a period as fourteen years, and we think that some provision might be made for permitting those to marry who had done work satisfactorily for seven years in college. It is most essential that a residence should be provided within the college precincts for that functionary, whether dean or tutor, who is answerable for the general discipline of the college, or who stands *in loco parentis* to the students. Indeed these junior fellowships form the great difficulty, and we are inclined to think that two kinds of fellowships might be sufficient, one answering to the seniors and the other to the non-residents spoken of above. The portion of the funds which would have gone to the junior Fellows might be employed in paying sufficient salaries to those engaged in tuition and in preserving discipline. In this way an inefficient person could be got rid of, but a junior Fellow would be a fixture for fourteen years, however great an incumbrance he might prove. Of course a non-resident Fellow might be appointed tutor.

Though not sanguine as to the Universities becoming places of technical education, still the Commissioners, we think wisely, recommend the establishment of a professorship of civil engineering. It is good for all schools of theoretical science to have the practical applications of theory under their eyes. There is a proposal that some accommodation in the way of a room or workshop, with the use of apparatus, should be provided for those who wish to carry on experiments by themselves. The want of this has certainly deterred many persons with a turn for experimental investigation from pursuing some idea which has occurred to them. The recommendation which will cause most demur is that of a doctorate in science, not from any jealousy on the part of divinity, law, and physic, but from the disregard of all academic titles which is now prevalent, and from the assumption of the title of doctor by so many questionable persons; but that we should have some means of aggregating to our academic bodies highly distinguished persons, by some process which does not involve examination, is what all will admit to be desirable. We believe that many persons would prefer the full degree of M.A., with its well-understood name and privileges, to the more pretentious title of Doctor of Science. This title would, for a long time at least, point out a stranger, whereas our object would be to make those distinguished persons whom we would draw to us as much at home as possible.

The Commissioners speak wisely and well in deprecating the tendency to look on the Universities as merely educational bodies, instead of as seats of learning. Of many kinds of learning they are now the homes, and it is most desirable that by furnishing themselves with every appliance for the cultivation of science they should become the foci of scientific life. Some things can be studied anywhere, but physical science localizes herself by demanding laboratories and museums. These appliances are daily getting more expensive, and, judging from the scheme of the Com-

missioners, there are no prospects of surplus funds to be bestowed on any of the fancy schemes which so many delight in contriving. After saying that it is "a primary duty of the Universities to assist in the advancement of learning and science and not to be content with the position of merely educational bodies," and touching on the spread of the feeling in favour of increasing the quantity and quality of education, both primary and advanced, they say:—"But there is some reason to believe that the preservation and increase of knowledge are objects which are not as generally appreciated by the public, and of which the importance is not so widely felt as it should be." In all this we most heartily concur.

THE WHEAT CROP.

ANXIETY as to the goodness or badness of the harvest in this country seems almost to be a thing of the past. England appears to have passed out of that phase of her existence when the yield of her corn-fields was a matter of vital or even of considerable importance to all classes. Bread is no longer, in the sense that it was five-and-twenty years ago, the food of the people. In years of prosperity the supply and the price of bread were always matters of less importance than they were in years of adversity; and a series of prosperous years seems to be yet unbroken—prosperous as no years have ever been before in making possible the payment of a scale of wages to the great consuming classes which has hitherto been unapproached in the history of the country. This high scale of wages, so long as our manufacturers can hold their own in the competition in the markets of the world, makes our statesmen and traders indifferent to the comparative plenty or scarcity, to the higher or lower price, of bread. It is no longer a question between existence and starvation, no longer a question between a very much greater and a very much less demand for the staple articles of consumption, no longer a question of somewhat less or somewhat greater wages to be paid to keep the labourers alive; for it is well known that the earnings of labour at the present time are sufficient not only to provide all that is necessary for subsistence, but also to afford a very considerable supply of luxuries. It is because the working classes now consume so much more meat than formerly that the price of that commodity has been so greatly raised and continues to be so high. It is the working classes who fill the excursion trains, and whose fares swell the receipts of the Railway Companies. It is the increased consumption by the working classes of beer, spirits, and tobacco that increases the Inland Revenue income of the country. And the effect of dearer bread would be perhaps but to lop off a few, and after all a very few, of these superfluities—a result which need not alarm any of us; and thus it is, probably, that so little anxiety is felt or expressed as to whether the barns of our farmers are well or ill filled. Moreover, the experience of twenty-five years of free trade in corn has demonstrated that, if the world is at peace, if communication with all the great producing countries is free, if the world's harvest has been of average extent, if England be the only country in want, enough corn will be sent here to prevent prices rising to a high level. In each succeeding year the development of new corn-growing regions, new railway communications, the speedier transit by steamships that are so rapidly taking the place of sailing-vessels, assure to this country the immediate supply of its needs, whatever they may be. The cereal year just ending affords a well-marked instance of the small disturbance that may be created by a bad harvest in this country. At this time last year, notwithstanding that we had no hesitation in pronouncing the crop to be a very bad one, we ventured to prognosticate that the foreign supplies would be sufficient, not only to keep the prices of wheat from advancing, but to cause a decline. Those skilled in the statistics of the growth and consumption of the country assured us that no less a quantity than about 12½ millions of quarters of wheat would be required to make up what was deficient; and although that quantity is forty per cent. in advance of the average importations of the four preceding years, no difficulty has been experienced in obtaining it. Indeed our anticipations have been singularly borne out by the course of prices; for although, as it appears from the *Gazette* Corn Averages, the value of English wheat last week was almost identical with its value a year ago, yet meanwhile there has been a fall of about 5s. per quarter, the lowest prices having been reached in April. Throughout the year, however, there has been very little fluctuation in values. There has been enough at all times, but none too much, and the year closes with empty storehouses at our ports, and with farmers' granaries and rickyards cleared out and ready to receive the new crop. Moreover, the resources of the country have enabled us to pay for this larger quantity of food without money-market troubles, and the new cereal year begins with money as cheap as any one can desire it. The time has arrived for us to take a fresh survey, a new outlook, and endeavour to make a forecast based on the results of the harvest now being gathered in.

Not even the most sanguine could expect the harvest to be a good one, if the influence of the weather for good or evil is to be counted upon. From the autumn throughout the early winter it will be remembered that rain was not only continuous but copious; it fell, indeed, to so great an extent that farmers had no chance of preparing their land for wheat; and consequently large areas remained unsown, to be planted in the early months of this year, either with spring wheat, at all times a hazardous and rarely a prolific crop, or with barley or oats. The wheat that was planted, unless it was on land in very dry situ-

ations, or on land that had been drained in the best manner, had its roots damaged by the water under which they were submerged, and the result was a miserably unhealthy and thin "plant." Much of the land so sown was ploughed up in the spring to be re-sown, or devoted to another crop, while that which remained has produced a very poor produce. The unhealthy winter-sown and the undeveloped spring-sown wheat had to encounter a bitterly cold spring, and late frosts and an ungenial temperature up to the month of June; and none but the most superficial observer would believe it to be possible under such circumstances that anything like a good yield could be the result. Every gardener knows that it is vain to expect fruit in perfection and in abundance unless the plant or the tree be in the highest state of vigour, and that no weather, however propitious, in the later stages of development and ripening, can make up for starvation or rough treatment in the earlier periods of the formation of the flower or fruit. There was a week or two of warm summer weather under which the wheat-fields seemed to improve, and there were as usual wonderful stories of the prolific yields that the harvest would give. The harvest was expected to be late, yet we were told that those few days had so hastened maturation that after all it would be no later than usual. But the spell of fine weather passed away, dull days supervened, storms of rain have been sweeping across the country, and early in this week, the last week of August, it was only in the earliest districts that wheat had been placed safely in rick, while in the great Midland and Eastern counties districts it is scarcely too much to say that nearly the whole crop was still in the fields. A late crop is proverbially a bad one, and the crop of 1873 will certainly help to prove the truth of the proverb.

So much is still ungarnered, and therefore in jeopardy, that it is too soon to attempt to give a correct account of the quality and condition of the grain, and we must be content with an endeavour to estimate the quantity of it. The most important element of the calculation is the quantity of land that has been planted; and, apart from common observation, we have the authority of Mr. Thomas C. Scott and Mr. James Sanderson, who publish their opinions annually in the *Times*, for saying that the area planted is considerably less than the average. The former gentleman expects the deficit, as compared with last year, to be 500,000 acres, and the latter states that the "area sown in autumn was probably the least that has been sown in a century"; and, although extra quantities of light and other lands were sown in the spring, he yet estimates "the acreage under wheat at 20 per cent. under average," which amounts to a deficit of about 750,000 acres. Deducting this from the average acreage of wheat, we have about 3,100,000 acres, as Mr. Sanderson estimates, while Mr. Scott reckons on our having 3,300,000. Possibly the truth may be between the two. Never were the "Agricultural Statistics" of more importance than in this year; and if the Board of Trade could, by a concentration of energy, publish its summary, at any rate of the wheat acreage, before the usual time, at the end of September, it would render a most important service to farmers and merchants. Meanwhile let it be assumed that 3,200,000 acres are under wheat, although we believe that the deficit of acreage will turn out not to be quite so large. Next comes the question what quantity per acre has been grown. A much more favourable answer, by way of guess, could have been given two or three weeks ago than can be given now. The *Gardeners' Chronicle* published the opinions of its 200 correspondents on the 16th instant, and in summarizing them the Editor says:—"Last year's harvest was unquestionably a poor one. Our returns this year are even less promising than those which we received at this time in 1872." Last year 11 per cent. of the reports were "over average," this year only 4 per cent.; last year 37 per cent. reported the crop "under average," while this year 60 per cent. do so. Mr. Sanderson, relying on the result of yields ascertained by threshing, reckons the yield per acre to be 20 per cent. short of an average, or 5 per cent. more than last year, when his estimate was 25 per cent. under average. This is in apparent disagreement with the reports of the *Gardeners' Chronicle*, but the discrepancy may probably be found in the fact that the correspondents of that journal estimate the crop on a combination of acreage and yield. Mr. Scott's estimate of a crop only 2 bushels per acre, or 7 per cent. under an average must be, we fear, looked on as fallacious, as he would probably now himself admit, for his letter is dated August 15th, and since then nearly all the reports that have appeared describe the great disappointment which has followed the experiment of threshing. If we adopt Mr. Sanderson's estimate of the yield—namely, 24 bushels per acre (or four-fifths of 30 bushels), and apply it to the acreage we have assumed (3,200,000 acres), we have 9,600,000 quarters as the aggregate of the crop. Calculating in the same way, the average acreage, or 3,800,000 acres, would give, with the average yield of 30 bushels per acre, 14,250,000 quarters; and thus we arrive, by comparing these two quantities, at 4,650,000, or say 4½ millions, as the deficiency to be made up by extra importations. Excluding last year, the average importation of four preceding years was, in round numbers, 9 millions of quarters, and we therefore shall want this year no less than 13½ millions of quarters of foreign wheat. This quantity is, without doubt, very large, and it is to be hoped that the acreage may not be so small as has been reckoned, for we fear that there can be no doubt as to the deficiency of the yield. Fine quality of the corn and heavy weight may to some extent alleviate the mischief of the short measure; but under the best circumstances there seems every reason to believe that an importation on a scale equally large with

that of last year is a positive necessity. We have no stock at home or abroad to fall back upon; we are living from hand to mouth, and we have nothing but the crop and the future importations to feed us until next harvest.

Now what are these importations likely to be? Last year we expressed every confidence in our needs being supplied, because ours was the only needy country. France, frequently an importing country, had enough of its own and to spare. Its surplus was, it is true, much over-estimated, and although its exports fell far short of what was expected, yet the harvest of 1873 found France with empty granaries, and considerable imports have been needed to feed the people until the new wheats become available. If this want were likely to be a temporary one, it would be a matter of indifference. Unfortunately, however, France discovered some weeks since that her harvest would be a bad one; and although, hoping against hope, the French corn-traders trusted that the deficiencies were confined to certain districts, it is now manifest that universally throughout the country the yield is bad, and not only bad, but very bad. Under these circumstances, and as France could afford only about a million quarters for export in the year now ending, even with an exceptionally good harvest, it is clear that nothing can be expected from that country in the coming season. But we fear that something more, and that something worse for England, is equally clear; for the statements of the best authorities published in the French agricultural journals leave no room for doubt that there is a very serious deficiency from an average crop. The only matter in doubt is how great the deficiency may prove to be. The lowest estimates put it at 15 per cent., while others, made on equally good authority, put it as high as 30 per cent.; and the later, and therefore more trustworthy, opinions incline to the latter figure rather than the former as being nearer the truth. The growth of wheat in France and the quantity consumed in the country cannot be accurately ascertained. An average crop is supposed to give from 30 to 35 millions of quarters, and with an average crop France can spare some quantity, but not much, to her neighbours. If there be a deficiency of 20 to 25 per cent., it amounts to 6 to 8 millions of quarters at least. Rye and barley are so largely consumed as human food that, with a good crop of these grains, the whole of this deficiency would not require to be made up by importation; but unfortunately this year the rye crop is also exceedingly bad, and we are forced to the conclusion, if the opinions of French authorities can be relied on, that France will need at least (and some will say it is a low estimate) the smaller quantity we have named. Both in years of surplus and in years of deficit French opinions have often proved to be exaggerated, either in a too favourable or too unfavourable direction, and it may possibly turn out that they are so in this year. We can but deal with the figures that are presented to us by those likely to be the best informed.

The situation appears to be as follows:—England's deficit is probably 12 millions and that of France 6, or together 18 millions. England, the only buyer in the past year, has imported from all other countries, France included, nearly 13 millions of quarters of wheat. The two countries now require that quantity and fully 5 millions more between them. The question is, can this quantity be obtained? It is too soon to give an accurate or a complete answer, but enough is known to enable us to say that, unless America has a crop enormously in excess of last year, the quantity cannot be obtained. America has a good crop—a better crop in the States on the side of the Atlantic than last year, though it is doubtful whether the States on the side of the Pacific have so much; it is too much, however, to expect America to more than double her exportation of last year. It is improbable, if not impossible, that she can do so. Either France or England must then go short. There will be active competition between the merchants of the two nations wherever wheat is to be had, and the result of the competition will be to raise prices. Bread must be dear; certainly dearer than in the past year, and perhaps very dear. There is only one encouraging feature in the prospect—namely, the probability that the potato crop will be the largest and soundest that has been gathered for many years. Nothing reduces the consumption of bread so much as a plentiful supply of this vegetable, and it is to be hoped that the promise that it will largely take the place of bread this year will be realized. Whoever goes short, this country will not starve; but we shall have to pay a high price for our loaf.

BUTTON-HOLING.

THERE are at present three recognized modes whereby young men of some merit but of small fortune may make a fair start in the world. The first is matrimony; the second is borrowing upon life insurance; and the third is button-holing. Of these three branches of the great art of getting on, button-holing is at once the most scientific and the most secure. Profitable matrimony is not, as times go, a bad transaction; but it is, mostly a delicate and risky operation, and few there be that can work it with facility. In matrimony, moreover, the *quid pro quo* is always serious. The young women of the finest fortunes do not always possess the finest tempers; and diamonds have now and days a tendency to associate themselves with the grosser forms of the Lancashire dialect. The course also of legislation is not likely during the next few years to be so favourable to a due control over his wife's fortune as the young climber on the ladder of life could wish. The six years with subversive

notions on the subject of woman's rights. The women may very likely be used before long, as the householder and lodger recently were, for the purpose of "fishing the Whigs"; and even if the Conservatives should discover a less objectionable mode of securing office than the extension of the franchise to women, there has been talk enough about it to turn the heads of half the heiresses in England. In fact, if a young Englishman is desirous of marrying an heiress, and feels that he has a gift that way, we should strongly recommend him to look out for the daughter of a German manufacturer. Any little defects in style or dialect will not be easily recognized in a forger; and for the present a German woman with money is likely to have less nonsense in her than an Englishwoman similarly blessed.

A very shy or very ugly young man, who does not feel that confidence in himself which is essential to a successful operation in the marriage market, may, if his health is good and he is not afraid of work, prefer the second of the two recognized modes of beginning life. To purchase an interest in a well-established mercantile house, or to buy a partnership in a firm of solicitors, are modes of starting in life which have for some years back been considered eminently promising and satisfactory; but they are modes which imply in the operator not only a certain reputation for ability, diligence, and integrity, but also the immediate possession of one or more thousands of ready money. The process, however, of procuring the use of such a sum of money is one which presents no serious difficulties to a healthy and energetic young man, particularly if he has had a public school or University career. He insures his life with some first-rate Life Society for about twice the amount of cash required to enable him to make his start, and after furnishing such guarantees as may be demanded for his continuance of payment of the annual premiums, he raises the cash amount required, at a moderate rate of interest, and on reasonable terms as to repayment of principal, by mortgaging his policy to the Society. Borrowing upon life insurance is in some respects the simplest and easiest of the processes whereby impecunious young men of merit gain a start over their fellows in the race of life; but it is a process of which the ease and simplicity are very soon exhausted, and which may at a later stage of an adventurer's career be found to produce inconveniences which will more than overbalance the advantage of the start.

The process of button-holing is free from all the risks and nuisances which accompany the other two processes. It may be a long process, but art is proverbially long. It may be a troublesome process, but what can poor young men of merit expect to obtain without taking trouble? And of course it may in any given case prove to be an unsuccessful process. But then what is certain except the rise of prices? It costs not a bit more preparation than that which is required for a matrimonial, commercial, or professional speculation. It involves the adventurer in no irritating or clogging connexions or liabilities. And its grand advantage is, that if the button-holer fails in any of his operations, he is not compromised; he is not hampered, weighted, or damaged; he must, however unsuccessful, have gained something from his last operation, and he is free to begin again with at least as good a chance as he had before. Button-holing, as the name implies, is the art of establishing special relations with influential persons, and it is an art which undoubtedly requires a considerable amount both of trouble and tact. There are men who fail in this art because they will not take trouble enough; and there are men who fail because they are hopelessly wanting in tact. On the other hand, with painstaking and discretion, particularly if these qualities are set off by a good personal appearance or a frank and conciliatory manner, there are no lengths of success to which the button-holer may not hope to go. There are those possessed of these qualities who can button-hole, not only men, but groups of men. Several boroughs possess a speaker or two who can button-hole a public meeting, and there is at least one statesman at the present time who can button-hole the House of Commons. But such success in button-holing as this is quite exceptional; and the term is therefore usually and properly restricted to signify the art of establishing special relations with a patron. In this sense button-holing is the modern and refined representative of the old and coarse art of toadyism. As a common trade or regularly professed mode of making a livelihood toadyism is gone out in this country, partly because there is not so much to be got by it as formerly, and partly because other and less nasty ways of rising in life have been discovered. The rich or noble fools who in the last century kept their toadies, much as two centuries earlier they would have kept their jesters, have lost much of their patronage and influence, and new channels have been opened out to the clever men who used to live upon them. The place that was once given by favour is now given by competitive examination; and the man who was formerly driven to become a parasite may now flourish as a Special Correspondent. For these and similar reasons, pure toadyism has ceased to be profitable, and is pretty nearly extinct as a trade. If indeed it lives at all, it lives only in its modern and much less objectionable representative, button-holing. There is this in common between the toady and the button-holer, that they both seek to profit by trading on the foibles of a patron. If patrons were indifferent to flattery there would be no place for the toady. If they could appreciate hidden merit, there would be little success to the button-holer. Both depend entirely upon the frailties of the powerful. But there the likeness ends. The button-holer is almost necessarily a superior creature to the toady. The weaknesses which nourish him are not special, gross, and palpable, such as the stupid selfishness or the

enervating vanity whereby the toady thrives, but are simply those which are common to all men, whether in or out of office—namely, that men do not see that which is far off so well as that which is near, nor that which rates so well as that which obtrudes itself. The toady may, the button-holer must, be a man of some merit. The toady can hardly help being servile; whereas the accomplished button-holer works with little, if any, loss of self-respect. Altogether, if it is fair to consider this toady as surviving in the button-holer, it is fair also to admit that he is a vastly reformed character.

Under exceptional circumstances, such as an Eastern despotism, or the sway of a Western Saviour of Society, the ability to button-hole may carry with it riches, pleasures, and gigantic power. And the power which is thus exercised indirectly by the judicious button-holer is even more enjoyable than that which is exercised directly by his patron. It may be questioned whether the power possessed by an able Vice-Emperor is not actually greater in quantity than that possessed by his master; but there can be no doubt that it is in quality more enjoyable. To the discreet man there are few things in this world more delicious than to pull hidden strings; and when the high-spirited and intelligent Radical expresses a preference for Cæsarism, it is always with the implied condition that he can button-hole Cæsar. And in the ordinary circumstances of English life it is the opportunity and ability to button-hole that gives to a young man entering a profession or the public service a prospect of a brilliant success. Diligence, tact, quickness, and accuracy, good temper, controlled enthusiasm, the power to do without sleep, and an imperturbable digestion, all these combined in one man, say a Civil Servant, will no doubt save him from being a failure in his career. But they will not secure him a brilliant or a rapid success. They, or some of them, are among the conditions of success; but they are not the sole or the essential conditions. It is well that he should be diligent; but it is better still that the great man should think he is so. He may strive much to be quick and exact in his work; but he should strive more to catch and keep his chief's eye. To happen to be always standing just where that eye happens to fall; to be ready with his "Here am I, send me," whenever the chief is considering whom he shall employ on a delicate business, and then, of course, to do the business satisfactorily; to be about his patron; to occur to him; to observe him; to oblige him; and so, as the last and triumphant achievement, to become the man of whom his patron thinks the best and the kindest in his particular department or profession, and whom therefore he means to send to the top of it—this is the cheapest, the safest, and the truest art of rising in life; and this is what is ordinarily meant by button-holing.

ICELAND POLITICS.

GEOGRAPHERS tell us that Iceland belongs rather to Greenland and North America than to our continent, and certainly no part of what we commonly reckon Europe can be named which has so little to do with the rest or is so little known by it. Even in the great days of the island—the tenth, eleventh, and twelfth centuries—its population was too small to give it any influence on the course of affairs on the Continent, and ever since then it has drifted on unnoticed. After nearly four hundred years of independence, latterly as a rudely federal aristocratic republic, it accepted in 1262-64 the sovereignty of the Kings of Norway, followed Norway in the union of the latter kingdom with the Danish Crown in 1397, and, when Norway was severed from Denmark in 1815, remained attached to Denmark, though it ought, no doubt, to have been assigned to Norway. Its venerable Assembly, the Althing, was abolished in 1800; but in 1843 a new Chamber was created, to which the old name was given, and by means of which a certain measure of political life and agitation has been created. The great wave which passed over Europe in 1848 made itself felt even in this remote corner; a National Liberal party has sprung up, whose claims and projects are not without interest to other countries, and they are the more curious to us because they recall some of the questions which have arisen with English colonies.

The government of the island is at present practically vested in the Danish Ministry at Copenhagen, who are responsible to the Danish Diet for their general policy, but in no special way for Icelandic affairs. There is a Danish Governor of Iceland, who resides at Reykjavik; but his administrative power, though enlarged by recent changes, is still limited, all questions of consequence being referred to Denmark; and there is, as before said, an Icelandic Assembly, consisting of twenty-one elective members, and six nominated by the King; but it meets only once in two years, for a month at a time, and is merely consultative. Matters are brought before it on which it may express its opinion, but it has no positive authority, either administrative or legislative; the King may, if he chooses, issue a law or impose a tax in direct opposition to its votes. As legislation is very scanty, and as the few taxes levied are mostly, with the exception of the imposts on trade, in the nature of local rates expended for local purposes in the parish or county (Syssel), this weakness of the Chamber is less of a practical grievance than it might appear. It is, however, in theory indefensible; and Denmark, which has enjoyed a very free constitution for some time past, feels herself unable to resist the demands of the Icelanders for a system more conformable to modern ideas. A constitution was accordingly some time since drafted,

providing for the control of the Althing over the finances and for its initiative in legislation. This was submitted to the Chamber at three successive meetings, approved by them so far as it went, and rejected only because it did not also provide for an Icelandic Ministry responsible to the Althing. The National party insisted that without this provision the Althing could not make its control effective; the Danish Government, on the contrary, insisted on placing the affairs of the island in charge of one of the Danish Ministers of the King, replying to the remonstrances of the Icelanders that the power of impeaching a Minister was practically useless, and that to allow the Althing to expel a Minister from office by its vote would be to sever the administration of Iceland from that of Denmark, since it would be absurd to allow a Minister of Justice for the whole monarchy who retained the confidence of the Danish Riksdag to succumb to the Icelandic Althing. They offered, however, to allow the Althing to impeach an offending Minister before the High Court of Justice at Copenhagen, but this was not accepted, and the dispute remained unsettled. The real point at issue, as may be easily understood, is the desire of Iceland to have a separate local administration—to be, in fact, independent of the Danish Legislature, while owing allegiance to the Danish Crown.

Like most other political questions, this one has a sentimental as well as a practical side, and the former is perhaps the more serious. Ever since she acquired the island at the end of the fourteenth century, Denmark has used it very scurvily, doing little or nothing for its development, sometimes neglecting her engagement to send thither every year six vessels laden with the goods needed by the people, allowing no Icelandic to own a merchant ship, and for a long period maintaining a strict trade monopoly, under which the brisk traffic that was driven sometimes with England, sometimes with Hamburg and Bremen, dwindled and disappeared. Till far down in the present century Iceland was treated as nothing better than a preserve for Danish merchants; and both her literary awakening and her growing material prosperity have been the work of her own children, discouraged by the selfishness of a Government which showed here, on a small theatre, the same folly which proved so fatal to it in Schleswig and Holstein. Now, indeed, Denmark seems to have turned over a new leaf. The protective laws have been abolished, and an annual sum of about 6,000*l.* is taken from the Danish Exchequer to be spent in the island. But the jealousy and dislike of their foreign rulers which ripened during so many generations in the Icelandic people is not so easily got rid of. As the last six centuries have taught them to abhor government from without, so their stirring history and noble literature in the days of the old Republic (930-1262) have created a national spirit and a desire for national political life. On a smaller scale the literature of the Sagas, always known and cherished by the people, has now done for Iceland what its mediæval literature did for Italy, what its historical memories did for Germany, in the way of rekindling or feeding the passion for national union. There has thus sprung up within the last thirty years, chiefly (the Danes say entirely) through the exertions of the younger generation of literary men and priests educated at the Reykjavik Latin School and the University of Copenhagen, an agitation which cannot perhaps be called warm—for in Iceland nothing is warm except the Geysirs and volcanoes—but which is kept up with steady perseverance, and enlists the sympathy of the large majority of the people. It may seem hard to rouse an agitation or hold a party together in a country where there can be few public meetings because it is often a dozen miles or so from one house to another, where the two little sheets that serve as newspapers appear only once a fortnight, and the Chamber meets but once in two years. But the National party has for its leader a man whose eminent talents, dignified character, and consistent advocacy of the same line of policy have given him an extraordinary influence over his countrymen, Jón Sigurðsson; it has earned the gratitude of the people by forcing the Danes to abrogate the old oppressive trade laws; it embraces most of the clergy as well as of the farmers, and can always command a large majority in the Althing.

As this National party has been constantly in opposition, it has not till recently found it necessary to propound a positive programme, and there has been some difficulty in saying exactly what its wishes and schemes are. Hitherto the business of the party has been to complain, and the grievances complained of may by outsiders be thought more sentimental than practical. Personal liberty could hardly be more secure or more extensive than it now is in Iceland; there is probably no part of Europe where Government plays so small a part and so seldom crosses the path of the ordinary citizen by police interference. The taxation is very low, though it must be added that the taxpayers are very poor; justice is fairly administered; everybody is of the same creed. On the other hand, people declare that many things are neglected which the Government ought to undertake—the making of roads, for instance, the establishment of an inland postal service, the foundation of a school of agriculture, and the establishment of educational institutions for the teaching of practical sciences which are now totally neglected; and when the Danes ask how all this is to be done without taxing the island more heavily, they produce certain ancient claims which Iceland has upon Denmark, and allege that the 6,000*l.* a year now paid is but a small part of what she ought to pay annually till these are discharged. At the time of the Reformation the Danish kings seized the church lands, sold a great part of them very improvidently, and applied the money to their own purposes; they are also accused of having diverted sums con-

tributed throughout Europe for the relief of Iceland after the great eruption of the Skaptar Jökull in 1783; as well as of various misapplications in time past of Icelandic revenues. Smaller grounds of complaint need hardly be enumerated—that Danes are placed in office in Iceland, and jobs perpetrated for their relations; that the Crown lands are ill managed; that no proper museum is kept up, all the antiquities found being carried off to Copenhagen; and that there is no law school on the island, so that students are obliged to resort to the University of Copenhagen, where Danish, but not Icelandic, law is taught. As there are but two professional lawyers in Iceland—though these too happy farmers, not knowing their own good fortune, desire to have more—it seems no great hardship that the budding procurator who appears, like the alow blossom, but once in many years should get his mind enlarged by a visit to Denmark. But whatever these grievances may be worth, the real cause of the movement is the wish for a mode of government which shall recognize the national existence of Iceland, and be committed to Icelandic rather than to Danish hands. The Icelanders dislike the idea of being treated as a subject province, and having everything done for them, even supposing it to be done well; and they insist that it must be done ill so long as it is done at Copenhagen. There is, therefore, a general agreement in demanding some sort of local independence, but there have been various opinions as to the extent of the independence to be sought. What has been publicly claimed is the transference to Iceland of the Copenhagen bureau of Icelandic affairs (connected there with the Ministry of Justice), and the permanent residence in the island of the responsible Minister; or, which comes to the same thing, the committal of its administration to the resident Governor, who is now little more than an executive officer carrying out the instructions he receives from Copenhagen. To this proposal the Danes make two objections—first, that the King must have his adviser in Icelandic affairs at his elbow, else how is he to exercise his constitutional rights of sovereignty? secondly, that the Nationalist scheme would amount to a breaking up of the Danish monarchy, and the making Iceland an independent State. The Nationalists answer, that it would be easy to arrange the responsible Ministry in such a manner that one of the members of it should by turns be constantly with the King, as is the case with Norway, so long as Iceland does not refuse to pay the cost of the machinery. As respects their relation to Denmark, they maintain that their union with the Norwegian Crown originally was, and that their subsequent union with the Danish has always been, in point of law, a personal one, such as was the relation of Scotland and England before 1702, and as is the relation of Norway to Sweden now. Some patriots go further, and think that it would be well for Iceland to dissolve altogether her connexion with Denmark; they feel, however, that so poor and thinly peopled a country could not stand alone, and are in doubt where to bestow themselves. There has been some talk of uniting with Norway, towards which, as their original mother-country, the Icelanders have always cherished warm feelings; and the Norwegians have by various little civilities offered of late years endeavoured to draw the bonds of friendship closer. Norway is of course much nearer than Denmark, and is thought likely, now that her wealth is growing with her increasing trade, to be more liberal in money matters. Others among the National party have suggested that Iceland should offer herself to England, to which she was once on the point of being sold by one of the Danish Kings; in this way, they think, not only would self-government be secured to them, but the English capital which is so much needed for the development of the resources of the island would be more rapidly attracted to it. All this, however, is nothing more than the talk of irresponsible persons, and does not seem likely to have any immediate practical result; it is hardly more serious than the aspirations one hears in Shetland for a return to Denmark. The recognized leaders of the Icelandic Liberals profess loyalty to the Danish King, and content themselves with demanding a separate local administration for Iceland, the repayment of the sums which Denmark is alleged to owe, and the extension of the powers of the Althing. The more important of these demands have, it appears, recently found formal expression in a draft constitution which on the 28th of last July received the sanction of a Committee of the Althing, and which is to be submitted to the King by delegates deputed for the purpose. The chief provisions of this instrument are, we are told, that Iceland shall in future be connected with Denmark by a personal union only, and shall be governed by a Viceroy with three Ministers responsible to the Althing. In the meanwhile, pending the final settlement of the new constitution, the King's assent is to be asked to a provisional arrangement to the effect that the Althing be at once invested with full legislative powers, that a Budget be submitted for its approval once in every two years—no tax being levied in Iceland for defraying expenditure incurred by the Danish Government—and that a special Minister, responsible to the Althing, be appointed for Icelandic affairs.

It is probable that the Icelanders may succeed in obtaining some considerable extension of the powers of the Althing, but it remains to be seen whether Denmark will concede demands which in fact amount to the virtual independence of the island. Iceland, it may be added, has by no means the same advantages for self-government which are possessed by most of our colonies, to whose example an appeal is often made. Its small population (scarcely 70,000) is scattered over a wide area;

there are no roads or other means of communication; it would be difficult either to bring public opinion to bear on a powerful Governor, or to keep the Althing in session to watch him during a considerable part of the year. On the other hand, she is united to Denmark by far looser ties than those which connect Great Britain with the larger colonies. Denmark was not her mother-country; her language, her literature, her national manners and character, her historical associations, are all different. The concession of a measure of independence to the island would not weaken Denmark, which draws from it neither money nor men; and though it would not produce in Iceland itself all those good effects which the Nationalists have persuaded themselves to expect, it would at least dispose the people to rely more upon themselves, stimulate their national life in all its branches, and make them exert themselves more vigorously in the development of their material resources. That want of enterprise which so much strikes a stranger, and which contrasts so notably with the magnificent force and daring of their ancestors in the tenth and eleventh centuries, is due in great measure to the state of dependent helplessness in which Denmark has kept them. A people with so much intelligence and so many private virtues may well hope to have, under more favourable political conditions, no ignoble future in store for them.

ENGLAND IN HARVEST-TIME.

IT is hard to say how much longer we shall have harvests in England. It is true that cereals are less speculative crops than some others—than hops, for example; still it is yearly becoming more expensive work to produce them, while it may be hoped in the interest of consumers that prices will, on an average of years, tend downwards. Land and labour are alike going up in value with us, and it seems possible that they may go on rising in a way which few people are as yet prepared for. As for the land, the mania of exchanging the hazards of trade and the sweet simplicity of the three per cents. for a lordship of the soil and admission to the caste of the squirearchy is already luring our *nouveaux riches* into investments where the returns are relatively a bagatelle; while eligible building sites in the neighbourhood of our cities fetch prices that are fabulous. As for labour, there are friends of the agricultural classes who assure them of such excellent times in store that it will become positively out of the question for farmers to employ labourers at all. We are promised manhood suffrage in the counties, when the emancipated serfs are to become conscious of their political strength, and are to force their own terms on their masters by means of a constitutional *jacquerie*. They are encouraged to look forward to a utopia when a fair day's wage is to be given for a fair day's work, when the fair day's work will be fixed by statute at something like the half of its present length, and when a couple of holidays in the week will be reserved for recreation in the agricultural institute or the beer-shop, according to the tastes of the elector. As those days draw near, however, it is possible that the farming classes, succumbing under the weight of their growing burdens, may be forced reluctantly to go into liquidation. Or, if the liberty of choice be still left them, they may elect to turn their lands to more profitable purposes than grain-growing. For while we shall have been proceeding with our social reforms in England without regard to any but strictly local conditions, the processes of civilization and the means of communication will have been developing themselves in foreign parts. Grain will be grown in remote districts more cheaply and in greater quantities than hitherto, as the farmers of the steppes and the prairies are brought into more certain connexion with the markets of the great cities. At present, large masses of grain go to waste, from the simple impossibility of finding seasonable transport for them. Then railways will have gone on spreading themselves through those new corn-producing countries, and production will extend in a corresponding ratio as mechanical improvements are adopted. At this moment we may say that the agriculturists on the great prairies of the Mississippi basin have had their land for nothing; they don't want to make manure or buy guano; we may assume that their only outgoings are for machinery and wages, and these last are naturally high. But as machinery comes more and more into use, great economies will be effected in labour. So in that broad grain-growing belt of Southern Russia where the black soil stretches from the frontiers of the Polish provinces to the Ural Mountains and beyond them. There, too, the rent goes for little in estimating balances; there, too, the soil is of a fertility practically inexhaustible; and labour, although cheap enough, is often extraordinarily scarce. It is only comparatively recently that cultivation has been extending itself over these steppes of Europe, and population of course follows cultivation. What people want there is the machinery that shall supply the scarcity of labour, and that they are likely to have in future. Hitherto, and in America as there, the difficulty has not been so much the prime cost of machinery, nor yet the insufficient appreciation of its advantages; for Americans and Russians, as well as Hungarians and Wallachians, have long been alive to these. It is the expense of fuel, sometimes the absolute impossibility of obtaining it, that has delayed the more general introduction of steam. But an ingenious invention has just been patented which, if it answers the expectations of its projectors, may revolutionize all the conditions of farming in those timberless and coalless plains.

An English firm of implement-makers, Messrs. Ransomes & Co., have attempted to solve the fuel problem by arranging steam-bollers to be fed with straw, and in those parts straw is a positive drug and incumbrance. As it is not wanted for manure, it is piled in stacks and left to rot. If, then, greatly increased supplies are hereafter to be shot into our grain markets from the elevators at Chicago and elsewhere, prices must ultimately go down under the pressure, and our English farmers will be puzzled to hold their own, heavily weighted as they are. It is probable, however, that they will have no cause to despair, but will still be able to pay their way in spite of falling grain markets. Even if the retail dealer should lower the price of bread, and the penny roll should be selling for a halfpenny, they may hope to be saved by their beef and mutton. Cereals thrive better in warmer climates than with us, and are by no means liable to be damaged in the transport. But animals which have been parched on the drier herbage of Australia, Russia, or Buenos Ayres will never compete in "prime cuts" with beasts of the field from our Midland counties, to say nothing of Aberdeenshire and Angus. It needs comparatively few hands to look to the stock on a grazing farm, and we fear that English meat may be in the ascending scale for many a year to come. So it is possible that corn may give place to horn, to quote from a standing agricultural toast.

These are somewhat melancholy reflections, but they are suggested by the pleasant sights of the season. We see landscapes such as Jules Breton or the Linnells love to paint lying in the noon-day blaze or in the softer moonlight, and enlivened by picturesque groups busy among the shocks and the standing corn, or piling the sheaves on ponderous waggons dragged by their clumsy teams; and we sigh to think that the day perhaps may be not far distant when all that life and bright variety of colour will die down into the rank green monotony of sewage farms. Cattle are picturesque no doubt; there is something agreeably suggestive of lotus-eating and voluptuous indolence in a great herd of dreamy shorthorns ruminating under the cool shade in the rich herbage by the banks of some winding stream, as they wait on the will and pleasure of the butcher. Thoroughbred Alderneys are, to our mind, quite as ornamental as deer, and as for the spirited little black West Highlanders, they show in the wild glades of some woodland park to as much advantage as the historical herds of Chillingham and Chartley. But even the cattle dotted about scarcely serve to relieve the sameness of a landscape that is all laid down in green. As you are rapidly whirled through it, you have no time to dwell on picturesque varieties of breed, colour, and form. Except for the first fresh verdure deepening in intensity and then dying away in brown, the aspect is the same from early spring to the end of autumn, when the cattle disappear in their stalls for the winter. The artist may make studies of the trees in a green country, but, so far as "bits" of lively nature go, he is very soon at the end of his resources. One cattle piece is much like another, even when a Paul Potter paints it. Cattle going out, cattle coming home, cattle being milked at morning, noon, and night, with lights and effects changing accordingly—you see the very most that is to be made of the subject in that great French saloon at Vienna where Constant Troyon exhausts ingenuity in trying his best to be versatile. The land laid down in tillage at least presents you with pictures far more varied and more homelike, even in the very depth of the winter, when the soil is being broken for the spring sowing. But of course the beauty of the scenes and their homelike interest culminate in harvest-time. They are constantly changing, and each is more taking than the other, as you go north from the coasts of the Channel to the Highlands of Scotland. What can be more brilliant in its way, in the light and the colouring, than the great wains that are being loaded on the broad yellow expanse above the white cliffs of the seaboard? There is a blaze of scarlet poppies wherever they have not fallen under the reaping-machine, and the chalk is reflecting the hot glare of the sun till you can see the air dancing upon its glowing surface; here and there in the group of busy figures is a crimson hood or a girdle that comes in as warmly as the wearers must find them; and thus you have a picture of the harvest-field at noon, with the white sails on the blue sea in the background. You may choose a companion study "at sunset" from the Midland or Western counties, which will be as different as possible from the other. It is old-fashioned farming there, and likely to remain so, thanks to the capricious character of the ground. Small fields run up in the nooks and angles of tangled copes. Hedgerows that might have been trimmed last in the times of the Heptarchy straggle over half the parish. The sun comes slanting down through the topmost oak boughs on the golden nook where the waggon stands drawn up; and the trees have thrown their heavy shadows on everything else. The shocks are balanced on ground that slopes at an angle of forty-five degrees, and the leading horse of the team has been taken out, because otherwise the waggon could not have turned itself. The people who are harvesting are the people of the district: they are all familiar acquaintances, and are shouting and laughing in spirits made boisterous by the imminent prospect of a harvest home. It is surely as peaceful and happy a scene as you would wish to look upon, and one which you would be sorry to miss either in nature or upon canvas; and one might multiply scenes of the kind from the glenlets let loose in the South, away up to the very north of Scotland, where the keeper charges the shooting pony with the armful of half-ripened oats which he has managed to save from the grouse and the red deer.

We shall regret to lose such scenes should the time arrive when all our grain shall come to us from Chicago or Odessa, and yet we

must own in candour that they show better on canvas or at a distance. Our "Cornfield in the Isle of Thanet" has been reaped chiefly by Irish and other labourers resident in Whitechapel and Bethnal Green, who have come to the sea-side for the season, like their betters. They are by no means regarded as social acquisitions in the neighbourhood, and both their habits and their morals leave a good deal to be desired. It may not be their fault that they are forced to herd together as best they may in empty limekilns or anywhere else, quite irrespectively of age and sex. Still this style of living conduces to a freedom of manner and speech which makes them anything but eligible models for the parochial youth of either sex who work with them in the harvest-field. They delight in humour, but the humour is of the broadest; their language is impassioned and animated to a fault, although the horrible blasphemies which come in as the regular garnish rather detract from the effect than otherwise. Of course they drink whenever they get the chance; and, as their limekiln offers but few attractions, they pass away their leisure time in the public-house. The liquor of over-night keeps still fermenting in them in the warm sun; and when they get into an argument, it is a word and a blow with fist, shillelagh, or murderous reaping-hook. So that a Southern harvest scene, peaceful as it may seem, by no means gains in charm upon close inspection; and neither there nor in the midlands will you lose anything if you content yourself with your first and more distant impression. The Irish, to do them justice, if they are loose in their talk and ready with their blows, are, as a rule, tolerably moral in their lives; and if their talk is often free, at least it is always lively. Our English labourers, on the other hand, are apt to let the freedom of the harvest-field degenerate into license of action, although it may be difficult to tell which is the cause and which the effect. Yet, if they are not so often licentious in their speech, it is mainly because it is not their vice to be lively. That it is the capacity and not the will that is wanting is shown by the doggedness with which they will ride some gross joke to death by boisterous repetition. We fear it is the proudest achievement of Hodges aping Don Juan to raise a blush on the face of comparative innocence, while his own dull and expressionless features are flushed by his exertions and by the muddiest of beer. We should say that the very worst place in the world for that young village beauty who stands on the cover of the ballad set to music, with the coquettish sun-hat on her head and the sickle in her hand, is the harvest-field where our idyllic poets are so fond of representing her. If English corn-land should be turned to pasture, we question whether the cause of virtue would lose by the change, although artists and ballad-mongers might have reason to regret it.

THE MARRIAGE LAWS AND THEIR WORKING.

THE Report recently issued by the Registrar-General contained a somewhat trite remark to the effect that "the system of marriage by banns in populous places affords great facilities for clandestine and illegal marriages." Three months earlier in the year so very obvious a truism would have passed with as little notice as a statistical table of averages, but at the beginning of the recess the streams which supply the columns of the daily papers run low, and even the *Times* must take what it can get, and be thankful. The result has been a slightly acrimonious controversy between the representatives of ecclesiastical and of civil authority, a kind of outpost skirmish between the forces—to use an expression just now in vogue—of the Church and the world, in which clergymen and registrars have been fighting each for his own hand, instead of dealing with the real question at issue, and which the *Times* has wound up, *more suo*, with a leading article starting from no particular premises and arriving at no intelligible conclusion, but very moral and dogmatic nevertheless. Of course if the question of the English marriage laws is raised at all, it is not to be disposed of after this summary fashion. Apart from the "religious difficulty," and the antagonism of the parish church and the registrar's office, a large portion of the recent discussion has turned on the comparative value of "banns" and licences as safeguards against irregular marriages. A very homely proverb was formerly, and perhaps may still be, current in the midland counties, which reminded you that you "could not bolt a deer with a boiled carrot"; and a comparison of value in that regard with a "boiled parsnip" as a means of effectual domestic protection might not untidily represent the practical bearing of this "banns" v. licence dispute. "Caesar very like Pompey, Pompey very like Caesar"; the one is just as great a failure as the other, "especially licences," if you look at them from the point of view given by the Court of Chancery. The real danger arising from the solemnization of clandestine or illegal marriages may be greater or less, and may or may not call for legislative interference. "Quiesca non movere" may be a rule of prudence in the matter, or it may be the resource of laziness or incapacity; but every one who has given careful attention to the marriage question during the past twenty or thirty years—that is, since the introduction of railways and the immense increase of population in London and the great centres of English life—knows that the security against irregular marriages afforded by the old ecclesiastical safeguards is absolutely worthless. With the alternative security afforded by the registrar's certificate or licence we are now not concerned. We believe that the registrar's banns were formerly read out at the close of Board meetings of Guardians, and that they are now hung up somewhere in the Guardians' offices; and it may be that fathers of marriageable, but

scarcely manageable, daughters may be able to sleep in peace under the shadow of that security; in which case we have neither wish nor intention to disturb them.

It is tolerably certain that any assertion of the utter worthlessness, as a safeguard, of the publication of banns will be met with an earnest and almost angry denial from thousands of country parsonages. From more dignified positions, where the rector writes himself "Surrogate," a like response will meet any parallel statement as to licences. The answer proves nothing in either case. Where the conditions of society in a neighbourhood make a clandestine or irregular marriage impossible under any ordinary circumstances, it is not likely even that the attempt will be made; and it is undeniable therefore that the licence obtained through the rural Surrogate is a very pattern of correct episcopal greeting, and that the marriage by banns in a village which does not see half a dozen weddings in the year is as orderly and free of "impediment" as the parsonage croquet lawn. But there have been times, all the same, when the smooth current of village life has been disturbed, and the ladies of the hall and the rectory have even forgotten to cut open the last number of the *Queen*; when the miller's pretty daughter has disappeared, and the scapegrace attorney's clerk in the market town is said to be away for his holiday. A very anxious letter goes that night in the Surrogate's postbag to an old friend in London, begging him to make immediate inquiries, of which the result appears a few days later in the form of a marriage certificate, "by licence," or "after banns," as the case may be. It was commonly said some years ago that the London and North-Western Railway had left no further need for Greta Green, St. Pancras Church being much easier and cheaper of access; and within the last few years the names of certain other churches in London have become conspicuous for the excessive and disproportionate number of marriages solemnized in them. One gross and open case of the kind has been repeatedly brought under the notice of the bishop in whose diocese the church is situated; but bishops are unable to take any real action in the confessed and utter confusion which has surrounded the working of the marriage laws. The Registrar-General would do good service if in his next Report he would substitute for the expression of mere vague generalities a table showing the number of marriages solemnized in every church in London, together with the population belonging to each ecclesiastical district or parish. The publication of such a paper would speak for itself.

It may be well to state in a few words as possible the conditions under which marriage may be legally solemnized in any church. They are based of course on the parochial organization, and much of the confusion of their working is the result of the practical breakdown of the parochial system in London for all ecclesiastical purposes. The marriage must take place in the church of the parish in which one of the parties resides, residence being held as established by a very brief period of living or lodging within the parochial limits. Legal residence being thus to a certain extent a fiction, it is not to be wondered at if it has been treated as a fiction entirely, and if the mere hiring a lodging without living in it, or even using an address with or without payment and without the pretence of taking a lodging, has been supposed by persons intending to marry to be a sufficient compliance with the law. The practical working of this idea is somewhat startling at first sight to an inexperienced searcher in many London registers, when he finds the same residence given for both bride and bridegroom in first one, and then another, and another entry, page after page. The simple interpretation is that the place of residence is fictitious as regards one of the parties, and very often as regards both. If it is known that inquiries are likely to be made in the case of publication of banns, it is an easy matter to arrange for their being satisfactorily answered. There is among the London poor a very widely prevailing desire to keep the wedding arrangements quiet. Partly to avoid expence, and partly to escape the notice which finds expression in "chaff," many a couple of the working classes look out for a quiet church out of their own immediate neighbourhood. "Why, sir, we are known there," a tidy young fellow once said to an incumbent who declined to take the notice of banns, and explained in what church they must be asked, "and rather than be married there I'd sooner not be married at all." He had his sweetheart on his arm at the time; and to go to another church "where the minister was not so particular" was the easiest thing possible. For if "residence" is an ambiguous word, "parish" is one of hopeless and endless diversity of meaning. A prominent member of the Metropolitan Board of Works was once called on at a parish dinner, as churchwarden, to propose the health of the clergy, and in doing so he carefully distinguished between the "real old rectors" and the "district clergy, excellent men in their way, but a mere mushroom growth," who presumed to call their districts "parishes." This controversy is deeply rooted; and accordingly the mother church continually asserts her legal claim to marry from the whole "parish," while the districts retaliate and protect their interests by asserting their right to get fees from the same area, with the result that each of half-a-dozen churches professes to be responsible for the residence of persons taken from a population of fifty thousand or one hundred thousand. The law is really distinct enough, restricting each church to its own ecclesiastical district; but the plea that no one could ever understand the Church Building Acts is plausible, to say the least of it.

It is unpleasant to be obliged to point out the real source and secret of this muddle; but it is necessary to speak plainly, and to say that if the clergy would give up the prevalent and unseemly

struggle and scramble for marriage fees, a great deal of the existing mischief and confusion would be avoided. We believe that in most cases the actual addresses of the persons married are honestly entered in the registers; but it is notorious that instances have existed where the mere name of a vast parochial area is entered as the "residence," just as it might be in the case of a country village with a couple of hundred inhabitants. It is, however, idle to expect any great reform in the practice of churches while the grotesque tradition of Doctors' Commons (to use the old phrase) remains untouched, and while any one who chooses to declare a falsehood, or who is ignorant of the requirements of the law, can get any licence he may ask for. It has often been noticed—and that in a way not complimentary to the dignitaries whose "greetings" to "our well-beloved in Christ" are scattered broadcast over London—that while the poor parson may be terribly punished for an irregular marriage by him, the diocesan official, not to say the prelate, whose name appears on a licence for a clandestine and illegal union has been unaccountably, and of course unintentionally, left out from the penal enactments of the law. The clergyman to whom a licence has been presented is protected from any legal penalties if he solemnizes a marriage in accordance with it; but he is not the less morally bound to use his own judgment in acting upon it, and to refuse to solemnize the marriage if it appear to be either clandestine or illegal. There will be occasions on which, with all his watchfulness, he may be deceived, and may discover the deception when it is too late to remedy it; but even then something may be done to lessen the mischief of a clandestine marriage, and we have known an instance where a bridegroom was as much astonished and perplexed as the parents of the young lady, a minor, were relieved and enlightened, by the announcement of his marriage a few days subsequently in the usual column of the *Times*.

Instances of clandestine marriages by licence are naturally far less common than those of irregular ones. These last are constantly the result of ignorance, and of the natural supposition that a marriage may take place in the church which one or both of the parties ordinarily attend, which is perhaps not in more than half the cases arising in the suburbs of London the parish church of either of them. It is almost impossible for an ordinary household to know, in very many neighbourhoods, to what ecclesiastical district he belongs, although he may have very frequent and not very welcome reminders of the name of the civil parish to which he pays rates and dues. But, so long as he is bound to see that his daughters are married in a church prescribed by the law, he has a right to require from a legally constituted authority some definite information on the subject. If he thinks that he can obtain this information in the precincts of Doctors' Commons, he will be more fortunate than we can encourage him to expect. With reference to the question of residence and other matters connected with the civil right of persons to enter into a contract of matrimony, it is impossible that the parochial clergy of London or the great centres of population elsewhere can long continue to be regarded, or to regard themselves, as personally responsible. Publication of banns may be a venerable ecclesiastical custom, but it is not any real safeguard or protection to society. The question whether there is "any cause or just impediment why two persons may not be joined together in holy matrimony" is a question for the law to answer, and sooner or later its decision must be made to rest on the authority of the civil power. That decision made, the succeeding question as to the church or other place in which the marriage shall be solemnized may fairly be left, as one would think, to be settled according to the wishes of the persons chiefly interested, to the convenience of family arrangements, and to the guidance of common sense.

THE COMPETITION MANIA.

THE Commissioners under the Endowed Schools Act express a confidence in their own principles which unfortunately is felt by nobody outside their office. One of their body almost pathetically laments that the public will not read the Report of the Schools Inquiry Commission to which he was Secretary. If people would only read his blue-book, and become convinced of the necessity of being reformed by him! But people either will not or cannot understand. It would have been easy for the Endowed Schools Commissioners to have printed and circulated this wonderful Report of the Schools Inquiry Commission, which ought to have prepared the way before them. But they entered on an unprepared road, and very rough and toilsome they found it. They did indeed put forth a manifesto of their own which enunciated some large principles and "rather frightened trustees" of Grammar Schools. This "Paper F," as it is called, contained a statement that "the Commissioners would be wrong not to avow their intention of laying the greatest stress on the eventual prevalence of the maxim that there should be no gratuitous education except as the reward of merit." Ill-natured critics say that the authors of this paper have been infected with the prevailing mania for competitive examination. They have "the courage of their principles," and perhaps when they have seen more of the world and its crooked ways, they will learn that the less that is said the more is likely to be done. But they innocently assumed that everybody must have read the blue-book of their colleague, who, as a sort of modern St. John, had announced the approaching revelation of a new gospel. A voice was heard crying in the wilderness "Competition, universal competition!" But little children be brought to the Commissioner and he will examine them in Latin grammar. But

those who are weary of learning lessons come to him and he will give them more to do. The children of England, not having read this interesting blue-book, do not foresee the trouble which awaits them. Alas! regardless of their doom the little victims play. They know not that the fair-spoken gentleman is ready to set them a paper in arithmetic. Happily for the children, their parents have become "rather frightened" by Paper F. The Commissioners find themselves misunderstood and even ridiculed, and they must be content to await the "eventual prevalence" of their maxim at the millennium. But still they are confident in their principles. "If," says one of them, "the Endowed Schools Act is allowed to work, there will probably be a large rush of endowments for the benefit of the schools." It was pointed out to him that in one conspicuous instance the rush had been the other way, and endowment had been withheld from fear that the Endowed Schools Act might affect the application of it. This, he admits, is true; but then people have not had time to read his blue-book.

The Commissioners have admitted that the working of the Act greatly depended on the co-operation of trustees, yet no policy could be less likely to secure such co-operation than that which they adopted. They have thought it their duty to remodel the constitution of the governing bodies throughout the country "on general principles," without regard to the practical working of the actual form of government. Nothing in the Act compelled them to adopt a course to which much of the opposition and difficulty they have encountered may be attributed. The supposed necessity of carrying out certain principles which had been enunciated in the blue-book already mentioned has been their ruin. They might have considered that, after all, good materials for governing bodies are not so plentiful as to make the work of reconstruction easy. They have proposed to introduce representatives of ratepayers, and a head-master who appeared as witness before the Committee fairly said, that "if it was wanted to give higher education, we should rather object to the people who will not use that education electing the governing body." Another proposal is to introduce into the governing body a member elected by the masters of the school. This proposal might possibly find favour among schoolmasters, but we believe that, if you were to take the opinion of the House of Commons or any other assembly of average Englishmen, the great majority would condemn it. The only expression of opinion in the Committee was by Alderman Lawrence, and he condemned it. He presumed that giving power to the head and assistant masters to elect was virtually giving power to the head-master, and this he did not seem to approve. The Commissioner who was under examination assumed him that this was not necessarily so, for the assistant-masters might elect adversely to the head-master; and this Alderman Lawrence clearly disapproved. He asked whether such an election was likely to tend to the good feeling and harmony and discipline of the school. This question the Commissioner did not directly answer. Probably he is aware that the balance of opinion is against him. If you were to ask the first twelve men you meet at your club, nine of them would probably say that if the head-master elects the member, he would do no good, and that if the assistant-masters elect him, he would do harm. The old-fashioned idea of managing a grammar school was to put a good head-master into it, and let him alone. A witness before the Committee said he thought "that the goodness or badness of a school depends far more upon the master than upon the governing body." The old plan is recommended by experience, while the new plan is a mere emanation of the brain of the Commissioners. They sat down seriously to consider whether they should let well alone, or whether they should try to make it better. Older and wiser men would have determined without consideration to let well alone. If they had been under a necessity to build we should not look so closely to the quality of their materials. But they assumed that this idea of a master's member or representative among the governors was so valuable that they have pulled existing bodies of trustees to pieces in order to apply it. Common sense teaches that the responsibility of the head-master is one thing and the responsibility of the governors is another thing, and that to mix up two things which ought to be kept distinct is wrong. We say that the plan would be viewed by the great majority of business men as wrong; but even if we go no further than to say that it is not manifestly right, that would suffice to condemn the Commissioners for forcing it upon reluctant bodies of trustees.

The great principle of "no gratuitous education except as the reward of merit" has been applied by the Commissioners so as to produce universal aid, as we think, justifiable discontent. We know that there are learned men who desire to put every man, woman, and child in England through a competitive examination, but we venture to doubt whether the system is suitable for children. It was objected to the Commissioners that they made reward dependent on intellectual attainment, and left moral qualities out of consideration. They answered that well-conducted boys were generally successful in their studies, and this may be conceded to them. If, however, we pass from school to college, we shall find examples of what are called "fast men" who have done well in the honour lists. Many of us can call to mind the names of men who have been very properly refused fellow-ships at their colleges which they would have got under a strictly competitive examination. The system of competition is unsatisfactory at any age, and more so as the age of the competitors diminishes. In many cases, no doubt, that system has been adopted as a welcome relief from the trouble of exercising patronage, but these Commissioners thought it their duty to interfere with all the grammar schools of England, whether they were working well or ill, for the purpose of extirpating patronage

and introducing competitive examination. We believe that the Governors of Christ's Hospital are endeavouring to get its constitution settled without the intervention of the Commissioners. The Governors are probably rather disturbed at the "rush of endowments the other way," and desire that wealthy persons who may be disposed to give money to Christ's Hospital may be informed what is likely to be done with it. We all know what the old system was. A man paid a certain sum to become governor, and he thus obtained a nomination to the school. If he was member of Parliament for a borough, his constituents of the middle class who had large families gave him a good deal of trouble when the time of his nomination drew near. If a struggling tradesman with four or five sons got one of them into the school, it did him good and nobody else harm. The widow of a clergyman or officer with a large family got some friend to apply to a governor of Christ's Hospital and had a fair chance of success. Among several similar cases it might be difficult to select the most deserving, and a perplexed governor might be glad to settle a troublesome question by turning over the candidates to a learned person who would put them through a competitive examination. The old system of Christ's Hospital looked for merit or need in parents rather than in children, and it looked for that which might with certainty be found. We do not, of course, deny that the system, as worked, fell short of theoretical perfection, but the Commissioners would be obliged to make the same admission as to the system which they propose to substitute. The Schools Inquiry Commissioners whose blue-book has unfortunately remained unread were shocked to find that among a lot of boys then recently admitted to Christ's Hospital "hardly any had had a good preparatory education." If this were so, they might reasonably have recommended that some moderate amount of preparatory education should be required. But this would not satisfy their desire for organic change. They gratified their own love of symmetry by distributing all the schools of England into first, second, and third grade schools, and they proposed to make Christ's Hospital a school of the first grade, or of the first and second grades combined, "and to fill it with scholars selected by competitive examination from all public schools of the third grade in England and Wales." The Commissioners under the Act have told us that they attached great weight to the recommendations of the Schools Inquiry Commission, and probably in the application of competitive examination to Christ's Hospital they would have gone, if it had been possible, even further than these recommendations went. They say in Paper F that "there is no point connected with schools on which the testimony of experienced persons is more uniform or euphonic than the ill effect of gratuitous education independent of merit." Let us suppose the case of a lieutenant in the navy who, according to the old saying, was unconnected with the asses and the Dunderges, and who had a family, and had sailed, although a gallant and experienced officer, to obtain promotion. Will anybody presume to say that a presentation to Christ's Hospital would not be well bestowed on the son of such a man as that, even if the boy throughout his school time preferred play to work? Take again the case of a half-pay officer settling at a town where there is a free grammar school of reputation to which he intends to send his boys. The Commissioners would take away the rights of residents to free education, they would establish scholarships open to the whole of England, and they would then announce in a blue-book that they had perfected a great and necessary reform.

RUSSIAN SOLDIER-SONGS FROM TURKESTAN.

SOME years ago a tiny volume entitled *Soldier-Songs* issued from Mr. Herzen's "Free Russian Press in London." The utterances which it was supposed to render audible were those of a down-trodden race, exposed to all manner of hardships and sufferings, and compelled by brute force to do the bidding of a detested master. Being by no means destitute of vigour, and giving evidence here and there of genuine poetic feeling, they were not unworthy, from a literary point of view, of the poet to whom they were generally attributed, Mr. Ogaref. But they bore scarcely the faintest resemblance to the songs which Russian soldiers were really in the habit of singing, and must have greatly puzzled those untutored children of nature, if they ever reached their ears. The themes on which the Russian military minstrel really loves to dwell are of a very different nature from those which inspired the Communist songster. The latter poured forth his sorrow and indignation in wallings and threnodies; the former is generally chanting poems, in honour of his regiment or his commander, or telling his tale of hardships endured and obstacles overcome in the tone of a man to whom past sufferings recall memories which are not altogether painful.

A few specimens of the authentic utterances of the Russian troops in Turkestan may not be without interest to English readers, especially to those who have carefully followed the accounts of the expedition to Khiva, or at least have made some acquaintance with the manners and customs of Central Asia, through the medium of Mr. Vereshchagin's pictures at the Crystal Palace. They are taken from the third part of the valuable collection of papers relating to Central Asia entitled "Russian Turkestan," and published last year at St. Petersburg. Their editor, Mr. Ivanof, who took them down on the spot from the mouths of the soldiers who sang them, vouches for their authenticity, but remarks that in many cases they are adaptations of songs which have previously done service in the Caucasus. Thence they have

been transferred into Central Asia, the names of persons and places having been altered from time to time by the force of circumstances. From the point of view, therefore, of the physical geographer they are often unsatisfactory, the existing face of nature being repeatedly credited by them with features which do not belong to it. But the pictures which they present of the life of the Russian soldier in the far-off land which is so unlike his own fondly-remembered home may be confidently relied upon, as well in most of its details as for the general impression it conveys.

No. 16, for instance, contains a full description of what its refrain styles "Our manner of living in Turkestan." Everything there, it says, is different from what it is at home:—

The Turkestan soldier carries a bag instead of a knapsack. All through the summer he is clad in a gymnastic shirt. His trousers are exactly like the poppies of the Steppe, and he has a kepi stuck on the back of his head.

As to what we do—we're either on the march, or working at all sorts of things. On the march—if it is along the plain, mind you take water with you. But if it is among the mountains, then you will have work enough for your boots. By day the sun roasts you, by night the wind pierces you through.

When the Turkestanian goes on a march he must carry everything along with him. If he doesn't do so, he won't get anything from the Sarts, for that horse is always shifting about.

We carry bottles with us, sewed up in bags, and we are always ready with kishmish [a kind of grapes] and tea. No sooner have you come to a halting place than the tea is boiling all ready for you.

On warlike expeditions our brother [i.e. the soldier] is always setting out. During such movements we have lots of diversions. One engages with the enemy, and works away with the bayonet. Then there are people to shoot at and try one's gun upon.

Should you take a town from the enemy, then you build a fort there at once. Many such-like forts have we set up among the Steppes.

Clever builders that we are, we make ourselves dwellings of earth. Of fuel we have no lack, lighting our fires with whatever comes handy—with thorns or cane, or with dry refuse.

We've already made friends with the Sarts, and got accustomed to live with the Kirghese. When you go into one of their houses, they treat you with koumis [fermented mares' milk], and with kishmish and green tea. We have begun to teach each other, so as to be able to have a talk, and nowadays the peaceful Sart addresses you as his brother.

On festival days we can get a good feast, and drink vodka made from grapes; besides tasting cakes, which they bring piping hot.

If a soldier only knows his drill, he will never go to grief. Never go to grief, but lead a jolly life. This is what is like, you see, our manner of living in Turkestan.

The greater part of the songs are naturally about fighting, describing various skirmishes with the enemy, or boasting of the victories which were crowned by the capture of Tashkent and Samarcand. Here is one which describes how the Russian troops dealt with the Khan of Kokand:—

The Sir-Daryan lads [of the Russian army] go roaming about the Steppe, but the Kokand fools are leaving their forts.

Suddenly our heroic commander moved his troops along the Darya. Boldly with him went the whole Russian force, ready to be always under fire.

Our father is he and our commander, the protector of his soldiers. Not a care is there among them, only songs resound.

To the Djulek fortress did we come, to regale Kokand and its Khan. Bullets and balls did we bring. "What do you order us to begin with?"

Without waiting for their orders whistled the cannon-balls on the mound. There did a howling arise—"O!-bo-ye, Uruss, Shaitan!"

Our general is not joking with you. He is ready to regale you. He will not let you out of his sight, however much the bullets may threaten.

His word is our law. With him we go into battle as to a feast. With him will we go right through, having made a breach in the wall.

The Beg saw it was a bad business; he shouted out "Allah!" He gave up thinking about the Djulek Kurgan, handing over to us all his standards.

Better is it for you to forget about your Kurgan Djulek. Strong is our Russian breast, we will seize all Kokand.

The Kokand men will we thrash, to the glory of the White Tsar. Nicely will we frighten them, till the Khan cries out "I will give up Kokand!"

"In memory of the affair under Zarni-Bulak" (the taking of Ketto Kurgan), "on the 2nd of June, 1868," a military songster has composed a spirited piece of martial verse. "The Bokharians," he says, "looking, in their red jackets, just like poppies, occupied their stronghold, and looked down on us as we marched towards them with our steady face. There were twice as many of them as of us, but they had a bad time of it when we gave them a taste of our bayonets." Then he proceeds to describe the fight:—

Hark! their signal is sounding! on comes their infantry—from their guns the balls are flying—their riflemen open fire, and shower a regular hail of bullets upon us, while all around gallop their horsemen.

But the Russian guns also open fire, "treating the enemy to grape-shot," and then a rush is made at the fortress. "The red-jackets are unable to hold out," and take to flight. After them hasten the conquerors, and in a little time the plain is covered all over with "heaps of dead bodies, all in wide trousers and Bokharian head-dresses." After this "the Amir wouldn't fight any more, but concluded peace with us," perceiving that, "although he had raised plenty of troops, yet the Russians were altogether the strongest." The poet concludes by stating that soon after the fight took place "our General Kaufman rewarded with a cross all who had distinguished themselves in it."

The song of the 3rd Battalion is full of confident aspirations. "We will subject Bokhara to the Tsar's power," it cries. "The brave General Abramof will lead us into action. Many a time has he shown himself what a hero ought to be." He will lead the troops to Khiva, just as he and Cherniaief "beat the Kokandians in Chenkent, and overthrew the Amir on the Darya, and those that remained in Khodjent."

The capture of Samarcand forms the theme of several poems, one of which begins as follows:—

It is not the dust that is sweeping around the Steppe, blinding the wanderer's eyes. It is our forces on the move, preparing themselves for the

march. From Kaufman have orders come to get ready by daybreak; and by the dawn the expedition is already on its way. For Samarcand is the army bound.

"By night," continues the bard, "the expedition started from Gish-Kupryuk, and without a halt it marched more than thirty versts to the river Zaravshan." Under the midday sun it already stood beneath the heights on which the son of the Amir had drawn up his countless forces:—

As when crows at the approach of evening wing their way towards a high mound, till the mound is no longer to be seen, but only a black mass, such multitudes of them having flown together: so did the Bokharians then, like so many crows, take possession of the whole of the heights.

But the enemy were "in a pretty pickle," we are told, when the Russian troops attacked them; first the riflemen and the cavalry, and then the whole of the columns "moving on with Russian courage":—

Into the river Zaravshan, the swift river, with linked hands did we fling ourselves. All the lofty heights of Chupan-Ata breathed forth smoke and bellowed thunder. From the throats of thirty guns rattled down on us a hail of cannon-balls.

But the attackers rush on undaunted, carry the heights, capture the guns, and rain down missiles on their foes till the Bokharians take to flight, "leaving only the soles of their feet visible," while, "like the thunder of God, rises and rolls and reverberates the Russian hurra." That night the conquerors pass on the heights; but next morning they march upon Samarcand, and enter the city without firing a shot:—

Then did our grey-haired general congratulate us in that we had gained a splendid victory. And afterwards he said "Thank you" [*Spasibo*] to all the troops. That's how we managed matters on the first of May.

Another song on the same subject begins in a similar strain:—

It is not a mist that is rising from the Darya, it is not a heavy shower that is falling. It is our noble general who is getting ready to set out with his troops for Bokhara. With cross and with prayer does he set out to capture the city of Bokhara.

A third contains a passage which may be interesting to investigators of the origin of our "Hurra":—

When we drew near to the enemy they began shouting out, "Ur, Ur," and many of them with martial mien came leaping down from the heights towards the plain. But scarce had the "Ura" arisen—the terrible, Russian "Ura!"—when they all immediately took themselves off from the heights; the hill was swept perfectly clean.

All the songs but one are triumphal chants, voices of exultation over a vanquished foe. The solitary exception tells the tale of the losses inflicted in the year 1864 on a small Russian detachment in the neighbourhood of Ikan. But even in it there is heard no wailing note, and towards its close the minstrel's voice assumes a vaunting tone. It was in the beginning of December, says the bard, soon after a frost had commenced, that news was brought to the Russian camp of a countless army of Kokandians being on the move. Thereupon Sérof was sent out with one gun and a reconnoitring party of Cossacks. "It was then the evening hour. A dark night came on as the Cossacks flew along. Glimmered the fires of the enemy as they drew near to Ikan." They sent on a guide in advance. Presently he came galloping back, having met a party of Kokandians. Then the Russians began to retire, but they were soon surrounded by countless foes—

But who was at leisure to count them? The Cossacks turned themselves into infantry, and began to picket their horses in a circle [they themselves remaining within it, as is represented in one of Vervahchagin's pictures]. No timorous people are the Cossacks. They twirled their moustaches and were all right.

Meantime the enemy attacked them on all sides, bringing up three guns, and opening fire on them, howling and roaring the while. But "the sharp-witted sons of the Ural" constructed a kind of defence made of sacks filled with earth, and from behind it kept up a steady fire with their single gun, which they carried on their backs when the splintered wheels of its carriage would no longer turn round. At length, after a long defence, thirty-six of their number having fallen, and the majority of their horses having been destroyed, they spiked their single gun, and began a painful retreat, supporting their wounded comrades, and destroying the rifles of those who could no longer use them—

Thus for eight versts did the heroes retreat quietly from the conflict. But then—Lo, once more the foe!

At this point the connected narrative suddenly breaks off, the ballad ending as follows—

Great were the losses of our comrades, but by their deeds will their friends remember them.

Nor will the "Salmoyedi" forget what a victory over such gallants cost them.

Long did they struggle and hold out; and, although they got the worst of it, yet did the Tsar reward them.

REVIEWS.

MASSON'S LIFE OF MILTON.

IN reviewing one of Professor Masson's previous volumes we noticed some mannerisms of style, and especially apparent imitations, probably unconscious, of Mr. Carlyle, which do not

harmonize with an ordinarily plain diction, and which are want of Carlyle, and unpleasantly grotesque from their exceptional character. We regret to find that the Professor has not thrown off these faults of manner. He is fond of putting his statements into the form of imaginary conversations. For instance, instead of confining himself with the fact that Milton and his first wife fell out immediately after marriage, he puts supposed bedroom squabbles into an ecstatic, but very commonplace, dialogue. "One seems to hear the sound of differences, of conflicting opinions about this and that, of weeping girlish wilfulness opposed to steady and perhaps too austere prohibitions. 'Well, then, I will go back to my mother; I am sure I wish I had never—.' 'Go.' And so the parting may have come about." And then, after Milton's wife has left him, and he has published a treatise on Divorce, Mr. Masson imagines the street-talk of reverend Presbyterian gentlemen walking home together from the Assembly; and the style of the imaginary conversation is certainly not happy. "Only a month or two married; his wife gone home again; and now, instead of proper reticence about what can't be helped, all this hullabaloo of a new doctrine about divorce! Just like him!" The following is very unnecessary and ecstatic apostrophizing, in lieu of what should be a simple account of the Pansophiae Prodromus of Comenius:—

A Pansophia was wanted; nay, a Pansophia Christiana, or consolidation of all human knowledge into true central wisdom, one body of Real Truth. Oh, wisdom, wisdom! Oh, the knowledge of things in themselves, and in their universal harmony! What was the mere knowledge of words, or all the force of pedagogy and literature, in view of that?

In the following passage Mr. Masson slides into vulgarities:—

I should not wonder if Milton was one of those more favoured spirits whom Hartlibb wanted to enlist in the great scheme of a Pansophia University of London, to be organized by Comenius, and whom he tried to bring round Comenius personally during the stay of that theorist in London in 1641-2, when the experiment of some such University was really in contemplation by friends in Parliament, and Chelsea had been almost fixed on as the site. But if so, I rather guess, for reasons which will appear, that Milton gave the whole scheme the cold shoulder, and did not take to the good Comenius.

Again, unless tight, in the sense of serious or difficult, in which it seems to be used in the phrase "a tighter action against Milton" (p. 295) be a recognized Scotticism, in which case it may be pardoned to a Scotchman, we should say that it has an unhappy character of slang. Mr. Masson must take it as a compliment to the intrinsic value of his book that we dwell on these peculiarities and shortcomings of style. He is not an affected writer; his ordinary style is natural, clear, and intelligible; but his writing certainly needs a more careful revision than he has vouchsafed to it, in order to clear it of apparent attempts (not happy as such) at fine writing, and of undignified slipslop.

Mr. Masson's second volume related the sudden marriage of Milton with Mary Powell, the young daughter of a poor Oxfordshire squire and magistrate keeping up appearances beyond his means. She was little over seventeen when this marriage was hastily and, for us, and apparently for Milton's friends, mysteriously concocted. The marriage, quickly followed by the bride's return to her parents, is now really a great mystery, which Mr. Masson, not certainly from want of zeal or industry, has not successfully unravelled. Milton's nephew, Edward Phillips, is our best authority for dates, but clearly a bad one; and he must have greatly misremembered when he wrote in his biography what as a boy, for he was at the time Milton's pupil and in his house, he must have known well. As to the time of the marriage, which he gives vaguely, he cannot be far wrong. Milton, he says, went into Oxfordshire on a visit, from which he returned to London a married man, "about Whitsuntide" 1643. Whitsunday was May 21. Milton is said by Phillips to have returned to his house in Aldersgate Street "in about a month's time." He would have been married then probably early in June. Some of his wife's relations accompanied the newly-married couple when they came to town. "The relations," says Phillips, "stayed about a week, during which time there was much feasting and merriment; for about a month after they were gone, the newly-married wife remained with my uncle." Then Phillips goes on to say that "late in July or early in August" 1643, the wife went to her parents, on a request from them, "to which my uncle consented, on the understanding that she was to come back about Michaelmas." It seems clear, from a discovery by Professor Masson, that Phillips must have got wrong in dates as to the wife's return to her parents, and have made serious mistakes about the alleged leave of absence till Michaelmas. Phillips proceeds:—

Michaelmas being come, and no news of his wife's return, he sent for her by letter, and, receiving no answer, sent several other letters, which were also unanswered, so that at last he despatched down a foot messenger with a letter desiring her return. But the messenger came back not only without an answer, at least a satisfactory one, but, to the best of my remembrance, reported that he was dismissed with some sort of contempt. . . . It so incensed our author that he thought it would be dishonourable ever to receive her again after such a repulse; so that he forthwith prepared to fortify himself with arguments for such a resolution, and accordingly wrote two treatises, by which he undertook to maintain that it was against reason, and the enjoinment of it not provable by Scripture, for any married couple disagreeable in humour and temper, or having an aversion to each other, to be forced to live yoked together all their days.

New Mr. Masson has discovered what appears to be indubitable proof that Milton's first Divorce treatise was published by the 1st of August. The proof is an entry of this date in the copy of the treatise which belonged to Thomason, the London bookseller

* *The Life of John Milton: Narrated in Connection with the Political, Ecclesiastical, and Literary History of His Time.* By David Masson, M.A., LL.D., Professor of Rhetoric and English Literature in the University of Edinburgh. Vol. III. 1643-1649. London: Macmillan & Co. 1873.

and tract collector, whose wonderful collection of tracts is in the British Museum, known as the King's Collection. What becomes then of Phillips's story of Milton's waiting till Michaelmas and then proceeding to publish? Mr. Masson states the matter thus, and we trust his judgment and Thomason's date:—

The note was put there by, or by the direction of, the collector, Thomason, to indicate the day on which the copy came into his hands, and is to be relied on implicitly. The Tract, it will be observed, was anonymous; but the words "Written by J. Milton," penned on the title-page by the same hand that penned the date "Aug. 1st," show that the authorship was no secret from the all-seeing Thomason. In short, on evidence absolutely conclusive, Milton's first Divorce Tract was in print and on sale in London on the 1st of August, 1643, or two months before Phillips's fatal Michaelmas.

There is another necessary deduction from August 1 as the true date of publication. Milton's wife must have gone to her parents sooner than "late in July or early in August." Supposing the marriage to have been near the end of May or early in June, she would probably have gone home at latest early in July. This would give time for the publication of the first Divorce treatise on the 1st of August. The treatise told, without names, Milton's grievance and his determination to live no more with his wife, and to untie, if he could, the knot which had bound them together. The story of this early separation is a mystery. Milton's language, which necessarily applies to his own case, is of the very strongest description. In luxuriant riot of description he speaks of "a mute and spiritless mate," "a polluting sadness and perpetual distemper," "one that must be hated with a most operative hatred," "forsaken and yet continually dwelt with and accompanied," "a powerful reluctance and recoil of nature on either side, blasting all the content of their mutual society," "a violence to the reverend secret of nature," "bound fast to an uncomplying discord of nature, or, as it often happens, to an image of earth and phlegm," "two carcasses chained unnaturally together, or, as it may happen, a living soul bound to a dead corpse." These are a few of Milton's fulminations in his first Divorce treatise, published August 1, 1643, against his own matrimonial lot. He had then been married two months only. The case must apparently have been a dreadful one, considering that it is Milton, a wise and good man, who writes. Here is a connected extract from his first treatise:—

For all the wariness can be used, it may yet befall a discreet man to be mistaken in his choice, and we have plenty of examples. The soberest and best-governed men are least practised in these affairs; and who knows not that the bashful modestness of a virgin may oft-times hide all the unlikeness and natural sloth which is really unfit for conversation? Nor is there that freedom of access granted or presumed as may suffice to a perfect discerning till too late; and, where any indisposition is suspected, what more usual than the persuasion of friends that acquaintance, as it increases, will amend all? And, lastly, is it not strange though many who have spent their youth chastely are in some things not so quick-sighted while they haste too eagerly to light the nuptial torch: nor is it therefore that for a modest error a man should forfeit so great a happiness, and no charitable means to release him; since they who have lived most loosely, by reason of their bold accustomed, prove most successful in their matches, because their wild affections, unsetting at will, have been as so many divorces to teach them experience; whereas the sober man, honouring the appearance of modesty, and hoping well of every social virtue under that veil, may easily chance to meet, if not with a body impenetrable, often with a mind to all other due conversation inaccessible, and to all the more estimable and superior purposes of matrimony useless and almost lifeless.

This was the outpouring of Milton's first wrath. Seventeen months pass; he has published a second Divorce treatise, and in March 1645 he publishes his *Colasterion*, chastising opponents, and his *Tetrachordon*, explaining four passages of Scripture on marriage. In the *Tetrachordon* Milton's phraseology is as it was seventeen months before; "the mere carcass of a marriage," "the disaster of a no marriage," "heavenly with holli-h, fitness with unfitness," "all the ecclesiastical glue that liturgy or laymen can compound is not able to solder up two such incongruous natures into the one flesh of a true besecring marriage." In the *Colasterion* there is a passage in reply to Prynne, "What book hath he ever met with, as his complaint is, 'printed in the city,' maintaining, either in the title or in the whole pursuance, 'Divorce at Pleasure?'" 'Tis true that to divorce upon extreme necessity, when, through the perverseness or the apparent unaptness of either, the continuance can be to both no good at all, but an intolerable injury and temptation to the wronged and the defrauded, to divorce then, there is a book that writes it lawful." This sentence is Milton's argument—extreme necessity, perverseness or apparent unaptness of either, preventing all good to both, and making continual injury and temptation for one. What does all this mean, as applied to Milton's case? It would seem as if the lady refused to act as a wife. Many external circumstances show that the marriage was likely to be regarded by the lady's father as one of convenience. By an old lawyer arrangement of Milton's scrivener father in 1627, Mr. Powell was debtor to John Milton of 300*l*. There was no sign of payment; Mr. Powell's difficulties were great and increasing; John Milton wanted a wife; he had probably been smitten by Mary Powell; he might have looked to the debt for aid in his suit. Milton goes down to Oxfordshire, telling his errand to no one of his household, except probably his father, and he comes back married, not with his wife only, but, strangely enough, with several of her relatives. What did they come for but to smooth matters and persuade an unwilling bride? They leave her, and soon after she leaves her husband and goes home. Milton is furious, and pours out before the public his fury against the system by which he suffers. Her mother takes her part, and keeps her at home. But the Powell family make no reproach or charge against Milton. His Divorce

treatises would be known to all friends and acquaintances, and could only be read as impeachments of his wife. At last they hear that he is seriously intending to treat his marriage as null, and is endeavouring to persuade a respectable young lady, daughter of Dr. Davis, "a very handsome and witty gentleman" (says Phillips), to marry him. What happens then? The wife, unrequested, comes up to London without notice, throws herself in Milton's way, makes no reproach, and begs to be forgiven and taken back. Milton takes her back, and then, there having been no previous sign or expectation of issue, "the first fruit," says Phillips, "of her return to her husband was a brave girl, born within a year after." Not long after her return, the whole Powell family, in distress, come to London and live with Milton, and he treats them all kindly and generously. His father-in-law dies in his house, January 1647. He still owes Milton the 300*l*., and also owes him a promised dowry of 1,000*l*. to his daughter. This mysterious affair of Milton's early quarrel with his wife needs further investigation; no further materials, it is true, may be in existence; but we are sure that, if anything more can be done to elucidate the mystery, Mr. Masson is the man to do it. In the meantime has he anything beyond conjecture to bear out his suggestion that Milton behaved harshly? Was he likely to be harsh to a young bride, whom he must have chosen from love? He is described as the reverse of morose. Aubrey says "he was of a very cheerful humour." His daughter Deborah says he was delightful company, the life of conversation, unaffectedly cheerful and civil.

There is a difficulty in reviewing single volumes or successive instalments of a large work. The best that can be done is to pick topics in a desultory manner. About the time when Milton's wife returned to him, in the middle of 1645, he began to collect his poems for publication. The volume was published in 1645, according to the title-page, and the precise Thomason again gives us the exact date, January 2, which, according to the dating of those times, would be January 2, 1645, but we should now say 1646. The publisher was Humphrey Moseley, who had a year before published Waller's poems, and had lately acquired the copyright of Denham's, published in 1642. Mr. Masson gives a very interesting account of a revived taste for literature showing itself in 1644 or 1645, and of Humphrey Moseley's part in the revival:—

In 1645, however, and especially after Naschy, there are symptoms of a slightly revived leisure for other kinds of reading than were supplied by Journals, Sermons, Pamphlets, and books of Polemical Theology, and of a willingness among the London booksellers to cater for this leisure. . . . Almost always, in such cases, a social tendency is represented in the activity of some particular person. Nor is it otherwise here. So far as Poetry and so-called Light Literature are concerned, one has no difficulty in pointing to the particular London publisher who in 1645, and from that year onwards, stood out from all his fellows by his alertness in the trade. This was HUMPHREY MOSELEY, who had his shop at the sign of the Prince's Arms in St. Paul's Churchyard. Something in his personal tastes, I am inclined to think, must have determined him to the line of business which he selected; so marked is his avoidance of all dealings in sermons, ephemeral treatises on theology, and pamphlets either way on the present crisis, and his preference for poetry and books of general culture. . . . Moseley was only on the way to make all this reputation for himself, and indeed Waller's volume of Poems, published in Dec. 1644, was yet the principal advertisement of his shop, when he and Milton came together. Pleased with the success of the Waller, it appears, Moseley thought of a collection of Mr. Milton's Poems as a likely second experiment of the same kind, and applied to Milton for the copy. The application was not disagreeable to Milton; and, accordingly, some time after the middle of 1645, or just while he was preparing to remove from Aldersgate Street to Barbican, and there came upon him the great surprise of his wife's re-appearance, Moseley and he were busy in arrangements for the new volume. . . . The revival of the proof-sheets may have been begun in Aldersgate Street, but it must mainly, as I have said, have been among Milton's first employments at the new house in Barbican. Here, at all events, is Moseley's entry of the new volume in the Stationers' Registers: "Oct. 6 [1645], Mr. Moseley ent. for his copie, under the hand of Sir Nath. Brent and both the Wardens, a booke called Poems in English and Latyn by Mr. John Milton." Usually the entry of a book in the Stationers' Registers was about simultaneous with its publication. In this case, however, there was a delay of nearly three months between the registration and the actual appearance. The precise day of the publication of the new volume was Jan. 2, 1645-6. Either, therefore, Moseley had registered the volume before the printing had proceeded far, or after the sheets were printed there was some little cause of delay.

This is pleasant and honest writing. Mr. Masson is even too honest in his work—that is, he is unnecessarily communicative in revealing his processes. Instead of giving the result of his reading, which would have been in every way better, and asserting—with reference, if he liked, to his authority—that poetry and literature were prosperous in 1646, and that Moseley was chiefly instrumental in the upward movement, he gives us the confidences of his note-book, and writes in the body of his work about Moseley:—"More significant still is the fact that it was Moseley who was the publisher of Waller's poems in December 1644. After that date his tendency to trade-dealings in poetry and the like is so manifest in the Stationers' Records that I find appended to my MS. notes from these records, for the Loudon bibliography of the year 1646, this memorandum:—'Poetry and pure literature looking up again this year, and chiefly through the medium of Moseley's shop.'" As a matter of taste, we should prefer the result without the revelation of the process. *Arret celare artem*. But there is something pleasant in genuineness and honesty; and Mr. Masson is genuine and honest. With great labour and minuteness he relates not only Milton's life, but also the history of the period. In both respects he accumulated with great industry and conscientiousness what we can only view as materials for a future work. As yet

history, Mr. Masson's labours will be an invaluable foundation for some future historian of genius and brilliancy; while as regards Milton's biography, we hope that Mr. Masson designs, and that he will live to execute, a classical life of Milton, for which we can only consider his present volumes as a preparation, and which we feel that he is capable of doing well.

WELLS'S POLYNIA.*

CAPTAIN WELLS is an ardent advocate of the approach to the North Pole by way of Spitzbergen, in opposition to that by Vin's Bay and Smith's Sound which is generally favoured by English voyagers and geographers, by Captain Sherard Osborn in particular. As one who has himself made acquaintance with that route, and who feels himself fortified by experience in facing the risks and uncertainties of new advances in the same direction, he is entitled to an attentive hearing for the arguments he has to propound on its behalf. Apart from this immediate object, his narrative of recent Arctic adventure has in it much to interest and instruct the ordinary reader. Without pretending to the fullness of matter or the artistic finish which made Mr. Hayes's volume so attractive, Captain Wells's book is straightforward and clear in style, securing our confidence by its unaffected simplicity and sterling sense. It was no formal or scientifically equipped expedition on which he went forth in the summer of 1872. The invitation of a friend (Mr. Leigh Smith, we are left to surmise), whose fine schooner yacht, the *Samson*, lay fitted out at Hull for a cruise to the Arctic Sea, was too strong for scruples on the score of short notice or inadequate preparation, or even the risk of being beset for a winter among the Polar ice. The special interest just now rife concerning the geography of the circumpolar regions and the action or influence of the Gulf Stream in the higher latitudes furnished motive sufficient for a seaman blest with such an opportunity. Everything had been done for the strengthening and outfitting of the yacht by another Captain Wells, an old whaler who had in the previous year reached latitude $81^{\circ} 24'$, seeing open water and islands N.E. of Spitzbergen, but who was compelled with a heavy heart to turn back from the enterprise of the *Samson*. One main object of this voyage was to verify an observation of his that the water is of a comparatively high temperature at a depth of four hundred fathoms, showing a difference of nine degrees at that depth when compared with the temperature at the surface. Of this remarkable fact, which many scientific men had declared impossible, he seems to have abundantly satisfied himself in the course of the cruise. The superstitious fears of the Norwegian crew had the year before baffled the attempt to penetrate the supposed open sea. The *Samson*, it appears, was better manned. She had moreover her massive bows braced by stout iron bands firmly bolted to her stem, extending round the bluff of her bows to about twelve feet aft, to meet the shock of the ice. Much sound advice went with her from the old whaler—in particular as to stepping too hastily upon floating ice, he having by his single weight caused an enormous mass, finely balanced, to topple over with him into the sea. The manifold perils of the Polar deep naturally formed much of the talk on board from the outset of the voyage—"You remember them 'ere claps as was left in this here way, and was all froze to death?" Such was the fate of the boat's crew of the *Enterprise* left upon the ice, whom their comrades, one of them sailing with Captain Wells, in vain tried to reach through the gale thirty degrees below zero, tying the oars and masts together to form a raft. Disappearing in the fog, the whole party perished. Though running many a risk in pursuit of the whale, the walrus, the narwhal, or the seal, in scaling icy peaks or crossing glacier chasms, our author and the *Samson's* crew had, on the whole, a pleasant and profitable time of it. So absorbing was the chase on one occasion, an old bladder-nose seal, with his family of five crouched upon a hummock of ice, being the mark for a dozen eager sportsmen from the deck, that the steersman let the schooner strike the ice end on, the jibboom and headgear coming down by the run. Experience of the difficulties of Arctic waters forced on our author the conviction of the incomparably greater value of a steamer than of a sailing ship, full rigged as the steamer ought in all cases to be. Ordinary masses of ice offer no opposition to the whaler under steam, and beyond the shock to the system of the sailor who is not ready when the look-out man sings out "Hold fast!" there is rarely any injury done to the craft itself. Appended to Captain Wells's work is a section of the model steam-vessel calculated for Arctic service. The *Samson*, however, showed herself sufficiently deft and enduring in urging her stem through the fragments of floes and drifting bergs, only once giving alarming symptoms of a leak, which it was difficult to find and to plug, threatening for a while to compel an abrupt run back to safe soundings, if not an abandonment of the vessel herself. Having attained a latitude of $80^{\circ} 32'$ to the North of Spitzbergen the ship's head was turned South, sighting the Shetlands once more on the 21st of September. The spoils of the voyage, which we should scarcely have considered so prosperous a one as our author calls it, were 237 seals, 2 whales, 2 narwhal, 2 bears, and 33 reindeer, besides a large number of smaller game, birds, &c., and a collection of Arctic plants, of which a botanical notice by Professor Heer is appended.

In addition to many pleasant reminiscences of adventure,

Captain Wells brought home with him a number of considerations which to his mind establish conclusively the superiority of the Spitzbergen route over that by Smith Sound. They certainly deserve to be attentively estimated and weighed, fortified as they are by the authority of Professor Nordenskiöld, who, however, we since hear, has been foiled of his confident hope of being able ere this to announce the great problem of Arctic geography solved. The Professor, who left by our author at Spitzbergen, was confident of beginning his journey northwards from his winter quarters on the 1st of April last, and of planting his foot by the 1st of July on the very Pole of the earth. His party of twenty-three in all was most carefully equipped with every Arctic necessary or appliance that experience or forethought could suggest. Mistrusting the use of dogs, his reliance was on a pack of forty reindeer to drag the sledges, as well as, in emergency, to serve as food. The materials for three houses of wood, ready made, were taken with them, with three boats of the greatest lightness consistent with strength, holding provisions for three months, over 6,000 lbs. weight in all. Their plan was to sail along the western coast of Spitzbergen, and fight their way over the frozen sea to the Seven Islands, their winter quarters. Starting earlier than Parry, who found the ice already broken up and loose, drifting southwards under the influence of the currents and gales of wind faster than his dogs and men could push their way over the floating masses, they hoped to find the ice newly formed, or of consistency enough, and not too much roughness of surface, for their passage over it. Difficulties of course were to be apprehended. The reindeer, though usually easily managed by their Lapland keepers, may in gales of wind become untractable; the herd may be separated or drift away on the broken fields of ice—a loss scarcely to be endured. Already, Captain Wells heard, the deer were suffering, and two of their number had died. Peumican may be a substitute by way of food, but what will supply the place of traction? Reduced as the party must then be to one boat, the smallest, some sixteen feet only in length, to what discomfort must they be exposed? They had provided for them, it appears, a sleeping coverlet of dogskin, the warmest and lightest, it has been proved, of all materials. Professor Nordenskiöld, who had already pushed his way in this direction in company with Von Otter, expected to meet with land to the North, though holding to the theory of open water at the Pole itself. Should this be found, a gale off the land would, in the opinion of some of his party, be the cause of much trouble. Should water with broken ice be encountered, the want of steam power would be seriously felt. Had Parry enjoyed this advantage, his object might have been successfully attained. With a light boat laden to its full capacity the task will always be a perilous one. Koldewey, a practical authority, has spoken of the whole route by Spitzbergen or Nova Zembla as a wild undertaking. Weyprecht and Payer, however, having followed the Gulf Stream into the Polar basin, hold strongly to the belief in a warm and open sea extending to, or rather flowing from, the Pole. And the same view is strengthened, to our author's mind, by the immense masses of drift-wood brought to the northern shores of the island, the flocks of birds hovering over the horizon, the blue clouds, also seen by Parry, to the North, betokening open water, not to speak of Esquimaux reports of animals coming down from unknown regions to the South. A subsidiary argument is to be found in the comparative inexpensiveness of this route, the northern coast of Spitzbergen being easy and rapid of attainment, and its shores and bays offering any amount of refuge and refreshment, whether to whaling or exploring ships. It is for some occult reason, Captain Wells suggests, that the reports of the various journeys for the relief of Franklin have been kept back from the public, seeming as they do with the difficulties of the route by Smith Sound. Nor can it be pretended that more facts of a scientific kind are to be gleaned along the coast of Greenland, the northern shores of Spitzbergen having been declared of equal value by men of science either for purposes of collection or observation, or as a base for goodetic operations. It is by no means to public funds nor to Admiralty enterprise that Captain Wells would look for the prosecution of the great problem. More money is frittered away, in his opinion, in public enterprises of this kind, and anything but greater responsibility or efficiency on the part of officers is ensured, while nothing more startling or shames the inexperienced naval officer than the ease with which the harpooners deal with what to such a one would seem crushing difficulties. "Whalers of experience are able to live, and live comfortably, where the man-of-war's man would assuredly starve." There is something to surprise us in this testimony from an officer of the Royal Navy, opposed as it is to the opinion ordinarily current in the service; nor can we confess that we are converted by it to the extent of wishing the conduct of an enterprise dependent upon consummate discipline and the highest professional feeling to be entrusted to amateur or mercantile hands.

One of the most interesting facts recorded by Captain Wells is that of the cruise of a skipper, Nils Jonson of Tromsø, in his little yacht of thirty tons, during the summer of last year. Michael Land, eastward of Spitzbergen and south of Gillis Land, instead of forming three islands, as laid down by Altmann, was found by Jonson to form one island 240 miles long, piled with drift-wood and abounding with animals, the deer being the fattest he had ever seen. From a high mountain (latitude $79^{\circ} 8'$, longitude $30^{\circ} 15' E.$) the island was seen to be nearly bare of ice, showing one small glacier alone towards the South. The water to the South and East was free from ice, with a bright sky above. In this sea Captain Wells considers we have passed to the eastward of the

* *The Gateway to the Pole; a Voyage to Spitzbergen.* From the Journal of John C. Wells, R.N. With numerous illustrations. London: Henry S. King & Co. 1873.

great iceberg system, since bergs would be found drifting from the eastward if they were generated anywhere in that direction. No ice-bound coasts are therefore to be encountered in this quarter, no floating barriers exist whose frozen walls offer no portal for the Polar explorer. The flat ice that is found floating upon these waters will surely yield a passage to the steam-ship, and open a way to the mythical Polynia. This name, by the way, which will not improbably puzzle our readers, we have heard explained on high authority at geographical meetings as denoting "spaces of open water in frozen oceans." We would gladly learn on what principles of etymology so much has been put into or got out of so curious a compound. Are we to take it as betokening vicinity to the Pole, or the number of open spaces nigh thereunto? In a word, is *πολύς* or *πόλος* the etymological radix? We wish we could share Captain Wells's confident expectation that the geographical problem is on the eve of solution, if not already solved, while we write. Anyhow, we thank him for the stimulus his work is likely to give towards Polar exploration, as well as for a lively and entertaining tale of adventure. The summary of Arctic enterprise prefixed to it traces in clear, though sketchy outlines, the exploits and the fate of the hardy men who have pushed forward the boundaries of knowledge towards the Pole, the names of British worthies—from Willoughby, Frobisher, and Davis downwards—being conspicuous among them. It will be an evil day when the British name shall be read no more in the annals of maritime adventure. A touch of nature indicating the tenderness which in general underlies or accompanies hardihood and bravery is seen in the episode of a solitary fly, the last of a few that went with the yacht, carefully watched and tended by the *Samsom's* crew. As its powers flagged, the insect was tenderly lifted to the topmost pane in the cabin window, to catch the warmest rays of the sun, and a becoming site was mournfully sought for its tiny dust. Of larger interest to the reader will be the tale of the last voyage and death of William Barczut, with that of the discovery by Dutch seamen of the wooden house in which his last winter was spent. The relics which had lain there undisturbed since the year 1597, now grouped together in the Royal Museum at the Hague, form one of the illustrations interspersed in Captain Wells's pages. Among them, besides a clock, were a curious but faultily designed metal disc by Plancius for astronomical purposes, books of the most recent date on China and India, as well as on nautical matters, rapiers, gunbarrels, and halberds, with the shoes of the little ship's boy who died in the winter. Sundry quaint vessels in earthenware and metal were also there, destined, it would seem, as gifts for Oriental potentates when the Orient was gained. To the dream of that early day has succeeded what we may hope to find a substantial gain in the extension of scientific truth.

THE MIDDLE-AGED LOVER.*

MR. PERCY FITZGERALD is a lively writer who understands very well the little artifices of his profession. He knows how to put together a story which shall be amusing reading for idle people, and which shall not offend against any of the ordinary canons of criticism. Moreover, there are some indications in his present story of talent of a rather superior order, and of genuine quickness in seizing and portraying character. The *Middle-Aged Lover* has the further merit of filling only two volumes of very moderate size; and though we cannot criticize it as though it belonged to a high order of literature, we can fairly say that it hits the not very exalted mark at which it is aimed. Novels of this unambitious variety must of necessity use some of those materials which have become the common property of all storytellers; and it is therefore without the smallest intention of casting any slur upon Mr. Fitzgerald's claims to originality if we say that he reminds us, in some respects, of one of Balzac's most familiar stories. The *Cousin Pons*, to which we refer, is not, in our opinion, one of its author's masterpieces. He has, as not unfrequently happens with him, degraded his hero in the attempt to render his situation pathetic, so much so that sympathy is occasionally swallowed up in contempt. The *Cousin Pons*, as our readers may remember, is the story of a poor relation who has been treated with the coolness appropriate to his position, until it is suddenly discovered that he is the possessor of a very valuable property. The various machinations to which his relations have recourse with the view of becoming his heirs subject him to annoyance, under which his health gives way; and the interest of the story consists in the description of his mental agonies, and of the desperate attempts which he makes to deceive the harpies who surround him in his last illness, with the inevitable result—inevitable that is, in a story of Balzac's—of the final triumph of unscrupulous selfishness, the death of the hero, and the ruin of the only friend who has been faithful to him. The resemblance of this story to Mr. Fitzgerald's is not, it may be said, very close. We do not, of course, speak of the difference of power between Mr. Fitzgerald and the man of genius who has so strange a fascination for many readers. But, in addition to this, the whole scenery and the surrounding characters are different. For Paris we must substitute an English manufacturing town; the hero is not a collector of curiosities, but a musical amateur; his wealth comes to him by an unexpected bequest, instead of being amassed in a life of un-

suspected toil; and his character is proud and independent, instead of being tainted, like that of poor Pons, by long habits of sycophancy. But, in spite of the differences, there are many points of resemblance in the surrounding circumstances as well as in the central situation to suggest that Balzac may possibly have given the primary hint which Mr. Fitzgerald has worked out entirely in his own style. Every novelist indeed must take hints from life or literature; and we could only wish that more of our writers would have recourse to the ingenious situations devised by their French rivals. It is, however, quite as likely as not that the coincidences we have noticed are altogether accidental, and we merely mention Balzac's story by way of briefly indicating the general nature of the situation in a *Middle-Aged Lover*.

Before the characters are placed in this situation, however, they have to be got there; and this process, which takes up more than half of the book, is not quite so well managed as the conclusion. The characters, indeed, are introduced with sufficient vivacity and are fairly grouped and contrasted. The central figure, who takes the place of the cousin Pons, is Mr. Doughty, one of those crusty bachelors, common in fiction and not perhaps very rare in real life, who beneath an exterior of rather cynical sourness hide warm affections and keen intellects. Mr. Doughty cares little for the circle of relations amongst whom he lives, and to whom he is generally known as "Old Doughty"; the epithet being prefixed, not by way of testifying affection, but as conveying the opinion that he is a premature mummy. In fact, he is not long past forty, and may therefore be supposed by people of a reasonable time of life to be still capable of feeling and exciting a tender passion. He speedily justifies this milder judgment by falling in love with the daughter of a wandering music-master, a young lady of splendid beauty, magnificent voice, and, in short, adapted in every way to be the commonplace heroine of a musical novel. Her father, however, is really well devised, and is by several degrees the best character in the book. In his circumstances he resembles the memorable Mr. Micawber, and shares that gentleman's taste for using the grandest language and the longest words attainable. The splendours of his manner, the fine, rollicking grandiloquence which renders his recollections of great musicians overpowering to his provincial audience, and his own firm belief in the intrinsic value of the various Brummagem wares which he tries to pass off for solid gold, are amusingly described, and he acts consistently to the last page. How such a daughter could have been the child of such a parent, or have developed so much true nobility of sentiment under such demoralizing conditions, are questions equally puzzling to the believers in hereditary influences or in the power of education. Luckily for them novelists are allowed to overlook such little difficulties, and to make the fairest roses blossom on the most disreputable weeds. Anyhow, Mr. Doughty is quite justified in falling in love with the superlative young beauty, whose taste in music is as unexceptionable as her powers of "execution" are astonishing. So long as Mr. Doughty is understood to be rich in nothing but his love of music, the father of his beloved looks upon him with suspicion, and snubs him the more decidedly because the lovely daughter has a second string to her bow in the shape of a handsome young officer, whose attentions have been of the most emphatic character. Arthur Pendennis was not more attentive to Miss Costigan than Arthur Duke to Miss Nagle, though the passion was in the first instance of a more serious character. Meanwhile the cousinhood looks on at the rivalry with amusement, but without any keen sense of personal interest in the result. Suddenly all is changed. A stranger leaves to Mr. Doughty a fortune of a quarter of a million; immediately his years diminish, his manners become distinguished, and the music-master's family become a set of base intriguers.

Unluckily, too, at this point the interest of the story begins to flag. Mr. Fitzgerald seems to have been seized with an unfortunate desire for mystifying his readers, and in consequence his story becomes for a time nearly unintelligible. Mr. Doughty and Miss Nagle are really in love with each other, and are really too high-minded to allow money to interfere with their affections. But unluckily it is necessary to the story that they should have a misunderstanding; and consequently they carry on a conversation in such long-winded sentences, and with so many indirect allusions, that they puzzle the reader as well as themselves. A good deal of that rather tiresome playing at cross purposes which always follows misunderstandings in novels goes on; and we confess that we were getting rather tired of the whole affair. A misunderstanding is generally a nuisance in fiction, because we see only too plainly the strings which have to be pulled to keep the puppets from falling into each other's arms; and when the misunderstanding is itself unintelligible, we very soon lose all interest in its solution. We were therefore heartily glad when Mr. Fitzgerald gave warning that we were about to "enter on a somewhat more stirring phase of this narrative." In fact, having wasted a good deal of time on these preliminaries, he suddenly wakes up, and becomes amusing enough. Poor Mr. Doughty is so much bothered by his misunderstandings and by his jealousy of the frivolous young officer that he falls into a nervous fever. This is the signal for the grand struggle round the sick man's bed. His relations at once awaken to the fact that a quarter of a million of money is going begging, and that it is only too probable that it will be left to the designing music-master's daughter. They instantly set to work with a spirit

* *The Middle-Aged Lover*. By Percy Fitzgerald. 2 vols. London: Richard Bentley & Sons. 1873.

worthy of the stake, their anxiety being sharpened by the fact that two or three of them are very hard up for money. They take dark counsels with designing attorneys and hypocritical doctors; they show a strong desire to be by the bedside of their dying relation, and to prevent anybody else from disturbing his last moments; brothers who have been celebrated for their fraternal affection quarrel over the spoil; and distant cousins who have been at daggers drawn suddenly strike up close alliances. It is doubtless an old story, and in one form or another has been treated by dozens of novelists and dramatists before Mr. Fitzgerald and before Balzac. Far be it from us to go into the various ins and outs of the intrigues of which poor Mr. Doughty is the centre, which could only be explained by telling the story nearly at the same length as Mr. Fitzgerald has told it. All that we need say is that the comedy is played out with a good deal of spirit, that the relative positions of the various actors shift rapidly but are kept distinctly intelligible, and that, in short, we follow the rather complex oscillations of the contest with as much interest as we can habitually take in stories of the kind. Mr. Doughty is not so tragic a character as Pons, inasmuch as Mr. Fitzgerald is not so great a master of the horribly pathetic as Balzac; the wicked doctor and attorney and the selfish relations have not the diabolical malice and acuteness which are manifested by the corresponding characters in the French story; but it would be unfair to compare light comedy with domestic tragedy. For some moods of mind perhaps the light comedy is the most suitable. We do not desire to be every day meeting with friends in black hats and white neckcloths, nor to assist at the martyrdom of an innocent arrayed in the costume of the nineteenth century. The ladies and gentlemen who surround poor Mr. Doughty are, as Mr. Fitzgerald tells us, singularly changed; from respectable clergymen, lawyers, and others of the ordinary type, they become unscrupulous hungerers after gold, "ready to go any lengths in the ardour of their unholy greed." This is true; and yet they somehow remain rather commonplace people. They are in fact confined even in their wildest moments by the regard for decency characteristic of the middle-class Briton; and though an attempt is made to get a sane gentleman shut up in a madhouse, the designing people never attain the dignity of genuine criminality. Mr. Fitzgerald, in fact, remains to the end a lively describer of manners, not a dealer in what is called psychological analysis. He shrinks from really treating the stronger passions, even when touching on tragic situations. However, the story, though not showing any amazing power, is amusing, and ends ingeniously. We have probably said enough to indicate its character to the lovers of this kind of literature.

Before taking leave of Mr. Fitzgerald, we will venture the rather trifling suggestion that, if he professes an admiration for Tom Moore, he should take the trouble to quote him correctly. The first line of one of his songs is not "When through life once blessed we roam," but "When through life unblest we rove." Moore's songs are, to our taste, very poor stuff; but the language is generally intelligible, which is hardly the case with Mr. Fitzgerald's version.

THE COMPLAINT OF SCOTLAND.*

WE noticed the Early English Text Society's edition of Sir David Lindsay's poems some time back, and, as we were pining and sorrowing for the Preface, Appendix, Index, and other comforts and conveniences of life which the Society's editors are commonly liberal in supplying to their readers, we thought that we described at a distance a Preface which would do for the Lord Lyon as well for the book to which it more lawfully belongs. We have since had it whispered to us that Sir David's own natural Preface is still somewhat more than in *posse*, that, like John Gilpin's hat and wig, it is upon the road. But *de non existentibus et non apparentibus eadem est ratio*; we have not got the Preface to Sir David of the Mount, and we have got the Preface to the *Complaynt of Scotland*, which goes a long way towards illustrating the Lord Lyon's works, as well as those of the contemporary writer. The two throw much light upon one another. They were written about the same time, in the same general form of the same language, but with smaller dialectic differences which Mr. Murray's skill does not fail to find out. And they are written on the same general subject and with the same general object, but with the differences which could not fail to be found in two men who plainly differed widely in character and calling, and not less widely in religion and politics. Sir David Lindsay was a layman and a courtier; the author of the "Complaynt" there is every reason to believe, was a priest. Both were religious reformers, but reformers of quite different classes. The Lord Lyon had clearly parted himself altogether from the old Church. The author of the "Complaynt" was one of those faithful members whom a corrupt society hates more than it hates its open enemies. He abhors heresy and schism, though he protests against persecuting heretics and schismatics. They have been driven into error by the corruptions of the Church, and they may be won back again by its reform. He nowhere flinches from strongly denouncing ecclesiastical abuses; but he denounces them from within, and not from without, as one who wishes to get rid of abuses in order that the Church may stand

the firmer, not as one who makes the abuses a ground for pulling down the Church altogether. Both are patriotic Scotsmen, but the form which their patriotism takes is not always the same. Lindsay is a statesman, and he has no special bitterness towards England. The author of the "Complaynt" shows Scottish feeling in a fiercer and more popular form. A traditional and unreasoning hatred towards England in all times is the groundwork of his whole way of looking at things. Here again the religious difference comes in; to the author of the "Complaynt" England is not only the old enemy; it is also the land of heresy.

To the "Complaynt" itself Mr. Murray has added four contemporary tracts, dating from 1542 to 1548, which bear on the relations between England and Scotland under Henry the Eighth and Edward the Sixth. Two of these are strictly State Papers, the Declaration of Henry the Eighth in 1542, and the "Epistle Exhortatorie" addressed in 1538 by Protector Somerset to the people of Scotland. Of the other two, one is the Exhortation to the Scots, by James Harrison, a Scotsman in the English interest, dedicated to the Protector, and printed in London in 1547; the other is addressed to Edward the Sixth, by one Nicholas Bodrigan, otherwise Adams, who puts forth an epitome of the King's title to the sovereignty of Scotland, meaning by sovereignty the old supremacy of the one kingdom over the other. This is also asserted in King Henry's Declaration and in the Exhortation of Harrison, but it finds no place in the more statesmanlike "Epistle Exhortatorie" of the Protector.

Mr. Murray, the editor of the present volume, is already favourably known to our readers as the author of the book on the Dialect of the Southern Counties of Scotland which we reviewed a short time back. He shows here, as there, the same power of rising above local prejudice, and of grasping the plain truth as to both the political and the linguistic history of his country. He gives a full and clear picture of the state of things which followed the death of James the Fifth, and which drew forth both the "Complaynt" and several of the poems of the Lord Lyon. Many things had, during his reign, worked together to weaken the old feeling of dislike in the Scots towards England, and the religious reformers above all looked to their Southern neighbour as their natural ally. Things were plainly tending, just as they were after the death of Alexander the Third, towards a peaceful union of the two countries, which was hindered by the intrigues of Cardinal Beaton in Scotland and by the overbearing temper of Henry in England. Then came the invasions of Scotland in the later days of Henry and in the days of Edward, with that brutal havoc which most certainly finds no precedent in the reign of Edward the First. These invasions, while they again aroused Scottish feeling against England, brought about what was something like a practical annexation of part of Southern Scotland to England, and gained for England at least the formal adhesion of a large body of what were called "assured Scots." At the same time the progress of the Reformation in England and the persecution of the reformers in Scotland drew the reforming party in that country still more closely to the English side. This state of things comes out in its full force in the murder of Cardinal Beaton, in the holding of the castle of St. Andrew's in the English interest by his murderers, and its capture by a French force acting on behalf of the Queen Regent, if she is so to be called. All this, it will be remembered, comes between Somerset's invasion of Scotland and before Pinkie. Then came a series of appeals to the Scots from Somerset himself, and from English and Scottish writers in his interest, three of which Mr. Murray, as we have seen, gives us in his Appendix. It is at this point, and largely as in answer to these appeals, that the *Complaynt of Scotland* was put forth to rouse the old national spirit, and to stir up the old national hatred of England to the highest pitch.

Mr. Murray goes at some length into the question as to the authorship of the book, about which more than one theory has been put forward. It has been attributed to one or more persons of the name of Inglis, to Robert Wedderburn, Vicar of Dundee, and to Sir David Lindsay himself. This last view Mr. Murray distinctly casts aside; the "Complaynt" is the work of a churchman of the French party, writing with a bitter feeling against England, and writing moreover, not, like Lindsay, in the dialect of Fife, but in the dialect of the southern Scottish counties. It is not Lindsay; it is not Wedderburn of Dundee; who it is Mr. Murray does not take upon him at all positively to decide.

The "Complaynt" is written in prose, in such prose as was undoubtedly meant to be highly eloquent. It is a curious comment on the taste of a time which delighted in allegory so transparent as hardly to be allegory, and in anything that might pass for a display of learning, however misapplied. The mass of historical references, some accurate, some inaccurate, but in neither case having anything to do with the matter—the discussions of philosophical subjects, even the rather pretty description with which the book opens—would all be looked on in modern times as intolerably out of place in a book written with a grave practical purpose. As for his language, the writer amusingly professes to write in a very simple and plain style, and rebukes those who indulged in Latin and "long-tailed words":—

Now heir I exort al philosophours, historigraphours, & oratours of our scottis nation, to support & til excuse my barbar agrest terms: for I thocht it nocht necessari til heif fardit ande lardit this tractet vith exquise terms, quillikis ar nocht daly valt, bot rather I hef valt domestic scottis language, maist intelligibil for the vlgare pepil, thur hec bene diuise translatours ande compilaris in ald tymis, that tuk grite pleier to contrait ther vlgare language, mixend ther purposis vith oncouht exquise

* The *Complaynt of Scotland* with one Exhortation to the Three Estates to be vigilante in the Defence of their Publick cell. 1549. With an Appendix of Contemporary English Tracts. Edited by James A. H. Murray. London: Published for the English Text Society; Trübner & Co. 1872.

terms, drouyn, or rather to say *mair formally, reuyn, fra lating, ande sum of them take pleisair to gar ane vord of ther purpose to be ful of sillabie haif ane myle of lynth.*

Notwithstanding this, no writer was ever more full of utterly needless Latin and French words, of which Mr. Murray has made a long list, and some specimens of which may be seen in the above extract. This was the fashion of the time; the language of Scotland was just then overwhelmed with a crowd of strange words coming in straight from the French, to which it is owing that, while the natural Scottish dialects give us the most unmixt Teutonic form of English, the high polite Scottish tongue of the time of the Renaissance has a more Romance vocabulary than anything down to the penny-a-liner's jargon of our own time. This was united with various innovations in spelling, which, according to Mr. Murray, make the language of this particular time harder for a modern English or Scotchman to understand than the Scottish language of an earlier time.

After a good many introductory chapters, "ane Epistil to the Queenis Grace," a "Prolog to the Redar," "ane Monologue to the Actor," and so forth, we come to the essence of the piece, "The Author's Vision," in which he sees a lady and her three sons, whose mother begins to reproach them, and thus at the eighth chapter begins—"Quhen the affligit lady, Dame Scotia, reprocht hyr three Sonnys, callit the Thre Estaitis of Scotland." They are exhorted against their old enemies of England by a vast number of examples from all times and places, amongst which we are rather in the dark about "ane prince of athenes callit circius, quha hed secret intelligens vith xerxes kyng of perse, quhilk was occasioun that he seducit diuorse grit personagis to rebel contrar athenes." When Miltiades is made a Duke we must remember, as in the case of Duke Theodosius, that Dukes of Athens had been considerable princes about a century before; and when Leonidas is made King of "Lacedemonia," we must remember that *Arcadia* was the mediæval name of the city. But "circius" is beyond us, and Mr. Murray's Glossary, which explains many queer forms of proper names, here gives us no help. The writer not uncommonly forgets his vision and his allegory, and speaks in his own name, several chapters being put in their headings into the mouth of the actor, to the complete forgetfulness of Dame Scotia. In several chapters he answers the arguments put forward by the English and the Scottish supporters of England, the statement and the answer being for the most part of pretty much the same historical value. He reproaches the English with believing the vain prophecies of Merlin, and proves, not altogether unreasonably from their own point of view, that the English and their Kings have no just right and title even to their own country, much less to Scotland. This we may call a just punishment on English advocates who, whether in the reign of Edward the First or Edward the Sixth stopped to talk nonsense about Brutus, Locrine, Albanactus, and so forth. It is a most curious example of the way in which nations can utterly forget who they are. The English argument, as set forth in the pieces printed in the Appendix, assumes that the Southern English are Welshmen, and both the English and the Scottish argument assumes that the Northern English are Irishmen. The Scottish disputant throws in the teeth of the English that they are no Britons, but Saxons; but he quite forgets that he and his countrymen were Saxons just as much, and that the real Scots never left off calling them so. The fact that the two nations spoke one language was too plain to be kept out of sight, but he tells us:—

There is nocht tua nations vnder the firmament that ar mair contrar and different fra vithis nor is inglis men and scottis men, quhoubelt that thai be vithin ane ile, and nychtours, and of ane language.

It is instructive to see how a confused nomenclature, brought in through a series of accidents, had led two sets of people altogether to misconceive both their past history and their present interests. A part of England became politically connected with the real Scots and took their name. As towards the rest of England, the Scottish, English, so to speak, took up the feelings and position of Scots, while towards the real Scots they kept the feelings and position of Englishmen. The Englishman of Lothian, calling himself a Scot, came to look on England as "the old enemy," while he dealt with the true Scot in such a way as to make the true Scot the ally of England. There is no denying the fact that, in the days of Edward the First, the only people in the island who had a real right to the name of Scots, John of Lorn and his countrymen, faithfully carried out the terms of the Commendation to the earlier Edward. The Scots fought for their father and lord, the Basileus of Britain, against the English of Lothian and their Norman King. On the other hand, the Southern English equally forgot who they were; they identified themselves with the Britons whom their fathers had eaten up, and talked about Brutus when they should have talked about Edward and Athelstan. Mr. Murray has perhaps wisely cut short the epitome of Nicholas Bodrugan, alias Adams, but we wish he had kept the place where,

in vindicating the rights of the English kings, he ignores the fact that the English are not descendants of the ancient Britons, mentioning indeed Hengist and Horsa and the false Saxons' blood as invaders, against whom the English kings had to contend, while Alfred and Athelstan are lineal descendants of Arthur and the old British princes.

We are not sure that this alone would prove Nicholas to be a Welshman. We have known English folk who have rolled Arthur and Alfred into one.

SCHERFF'S INFANTRY TACTICS.*

IT was to be expected that the path which Boguslawski trod with so much success should soon be followed by others. And there is a special satisfaction in finding that a mind has been devoted to the same line of study among those trained under the care of Count Moltke himself. For here we feel sure that we shall meet no overstrained assertions of the infallibility of a new theory, nor, on the other hand, any attempt for mere effect's sake to show up the imperfections visible to critical eyes in recent victories; but rather a deliberate weighing of their whole value, and of the causes of the wonderful successes achieved. In a word, we look for serious lessons for the future rather than for route commentary on the past. The practical application of ascertained facts to present wants, and their development where possible into sound principles for future guidance, have ever been the characteristics of the modern school that rules the Prussian army. How far these may be due to the influence of one great mind will hardly be known so long as the Chief of the Imperial Staff lives; but we can hardly be far wrong in supposing that he who in 1865 was far-seeing enough to point out that future wars must witness an expansion of the company column system yet undreamed of, if the new arms were to have their due effect, has approved the attempt which Major Scherff is the first to make to carry the same process of tactical improvement to its utmost limits.

One of the few points on which we would take issue with the author is at his opening, where he turns aside to condemn, though gently, those "recent works, mostly of a controversial nature, written with more or less ability, but not always to the point, to discuss the changes in tactics apparently rendered necessary." For here he refers obviously, as in later passages more directly, to that remarkable essay which first cleared the ground that he treads so firmly. It was of the very nature of Captain May's task, when he wrote his *Tactical Retrospect*, to awaken sharp controversy; for he had to announce a more complete change in the order of battle than modern warfare had ever seen suddenly introduced, and to show—which he did with an incisive vigour that has rarely been surpassed—how that which to conventionally trained minds seemed mere confusion was but the direct product of certain new conditions in warfare which new arms were bringing in. Judged by the effect, no writer ever did his work more thoroughly; and, if his instrument appeared somewhat roughly handled, its quick strokes were but a fit reaction from the dulness of those "mere text-books" which Major Scherff mentions only to pass them by, that formed the staple of tactical literature before his day. May has gone down to an obscure grave, an unrewarded man. But the fact remains, that either his teachings in 1867 were but prophecies of what was to come in the great war in which he died, or—what is more generally believed—that they were so powerful in their effects as to determine the action of his countrymen in the very direction which he pointed out as leading to certain success. Indeed Boguslawski, writing in a calmer spirit, and with much wider experience, has but enlarged on the foundations which May laid in the theory of modern tactics. And now, when a new and more scientific writer than either follows in their steps, he finds an auditory thoroughly prepared to hear him, and trained already to receive as elementary truths those very doctrines which once excited indignation and revolted prejudices, but which the "works mostly of a controversial nature" of his predecessor, aided by the evidence of accomplished facts, have forced upon the world.

And here it is well to say a few words to those who, having lately read the widely circulated work of Boguslawski, may think that another writer on the same subject can have little fresh to offer. The task of Scherff is one which Boguslawski's treatise by no means interferes with. Unlike the latter author, Scherff has not striven to give a complete view of all the technical problems which the late war suggests. He professes to deal with but one single section of them; and if he is found devoting his volume to the study of infantry alone, it is both the natural consequence of his own personal training in that arm, and of an instinctive knowledge that in importance it stands by far the chief. Such must be the conclusion indeed of any tactical writer who sees the proportions of his subject as they really are. Late events have conclusively demolished the theory which for a short space after the Franco-Austrian and Crimean wars gained prominence, that artillery could ever become the principal arm. Infantry, therefore, takes a large share of Boguslawski's attention. But Scherff deliberately neglects the other arms altogether, in order to produce a thoroughly scientific study of the branch to whose working in modern war horse, guns, and engineers are all in truth but accessories.

Moreover, the whole current of thought in the two works which we are comparing is divergent. Boguslawski's is essentially retrospective. Even when theorizing, the author constantly has present to him the experiences of 1870, and is content, as it were, if he can utilize them to the full as a guide for what is to be done hereafter. Scherff takes altogether a more far-reaching view. Though the same facts, as noted by keen observation, form the basis of his theory, it is specially directed to exigencies such as the German army has not yet had to face. The future struggles which he contemplates and for which he would prepare his comrades have

* *Studien zur neuen Infanterie-Taktik.* Von W. von Scherff, Major im General-Staffe (*The New Tactics of Infantry*, by Major v. Scherff). Translated by Colonel Lumley Graham. London: Henry S. King & Co. 1872.

nothing in common with a collision with Danes, or with Austrians carrying inferior arms; nor with the dispersal of Mobiles on the open fields of the Beauce, where they never had a chance of success; nor with the thrusting back of demoralized troops on the works from which they made half-hearted sorties. His imagined foes are assumed to be as well armed as the Germans will be when the Manser is in their hands, as well drilled and as obedient as they, and as confident, if it be possible, in their leadership. Only in the actual tactics of the battle, as practised beforehand, does he see that it may be possible to establish a superiority such as the real art of war would at once bring out. And the object of his work is to give his countrymen the key to this, and to direct the vast military training which the Germans undergo into such channels as other armies less studious will not discover until the necessity has been forced upon them by the bloody proof of war. Fortunately it is hardly possible in these days for any expert to keep to his own nation a secret of a military nature that would ensure perfect success. Major Scherff's first and second volumes were probably studied over here almost as soon as at Berlin; and Colonel Lumsley Graham's spirited translation, which now lies before us beside the original, gives to every British officer an opportunity of studying for himself how the most accomplished minds among German military men are dealing with the great tactical problems which the breechloader has raised.

Instead of taking a cursory view of the different chapters in turn, we will choose a single part of one as an example of the freshness and power of thought with which our author treats his subject. We purposely select an elementary one—namely, Scherff's explanation of the well-known division of the attacking body of infantry into its three portions of skirmishers, supports, and reserve. Now it is usually taken for granted that there must not only be these divisions, but that the proper proportions should, as a rule, be one-half for the latter, which is the main body in fact of the whole front line, and one-fourth nearly for each of the others. Such is known to be the usual method of employing that company column formation which has become—despite the dreams of some too hasty critics that it had failed—more and more the acknowledged battle order of the German army, as the results of the war are studied and embodied in its drill. How then does Scherff treat this, which is usually assumed as a theory that is convenient to use, but that is still rather conventional than the result of science, practical or abstract? We shall keep to the original as much as possible; only, for the sake of space, we must contract our excerpt considerably. We shall find that it is no longer a mere matter of drill, but of moral and physical necessity, in these days, that the threefold partition should exist; whilst the examination of the matter by our author will show how his whole details for the attack are made to flow naturally from the principles as they are fixed.

And first, as to the primary division between the skirmishers, or actual firing line, and the reserve or main body. Why is this division necessary? Why any reserve at all in these days, when firing may be said to be the actual fighting power that is to push the enemy back? For these reasons, if we follow our author. It must be assumed, he declares, that the firing line is to be comparatively dense from the first—that is, from the first moment that it comes within effective individual range. The experience of the late war has proved unquestionably that the old rule of reinforcing skirmishers under fire by degrees is far more dangerous and costly than throwing them forward at once as close to each other as they can fire with effect. This being so, the next point to be grasped as an axiom is that the only way in which a firm defence can be shaken by the attacking line is to maintain the fire of the latter unbroken as well as heavy from the first moment that it becomes thoroughly effectual. To attack weakly at first, or to pause in the attack to await support, will be fatal to the moral power, which in these days of rapid firing is quite as telling as it ever was before. The first minor point therefore to be settled before coming to the greater problem is the distance of the front rank or skirmishers from one another. Single in depth they must be, or they could not otherwise all use their fire-arms effectively. Each must have a small space of free elbowroom for the same reason. And yet it is necessary, for reasons already given, to put as many men as possible into this firing line from the moment of its fairly coming into full action. It will probably be found that about a pace and a half of front per man will be the proper distance. Hence, if the proportion of skirmishers be—as is shown later—about one-fourth that of the battalion engaged, the length of the front which the latter can cover to attack with a fair chance of success becomes known at once.

With no less certainty can be fixed the proper distance in rear for the necessary reserve, supposing it to be assumed that there is to be one. For the experience of the late war has shown that the best troops cannot be expected to abide the test of close independent rapid firing at a line which returns it, for a greater space, than five minutes. To be of use therefore for the coming onset, to be up fairly in time to make it, the reserve must not be above five hundred paces from the firing line when the latter once gets into the first part of this critical portion of the attack. As to the absolute necessity of this reserve, "it lies in the nature of man"—to use Major Scherff's words. For an uninterrupted rapid fire at a range so close and effective as is supposed will not only affect the line by its losses, but will produce such an excitement of the nerves that a charge forward or a retreat becomes the only choice. "For the one case, as for the other, it is therefore necessary that

the main body destined to attack must be up with its preparatory skirmish-line" (which alone is not strong enough to make the charge—here comes the necessity stated briefly), "at, or better, shortly before, this moment of impulse." In his more detailed discussion of the attack at a later point, our author goes on to show why this main body must be equal to the whole front line in strength—that is, it must equal both the skirmishers and supports it has covered itself with.

But what of these supports, of which nothing has yet been said? Cannot this part of battle tactics at any rate be simplified? There are many who imagined, from a first hasty reading of May's essay, that the infantry battle would come to be a single dense line rushing on almost, so he himself phrased it, "like a horde of savages," each man, to use the expressive Americanism, "fighting on his own hook." If Major Scherff has correctly gathered up the results of the war of 1870, this is evidently but a dream. The firing line does not attack; it prepares for the attack. But what of the supports, which are not of the firing line itself as first set up, nor yet of the actual attackers of the final moment? Cannot they at least be dropped as a conventional relic of the past? Such is the question which Scherff plainly has it in his mind to answer when he goes on thus:—

We have supposed five minutes of steady hot firing to be the maximum time possible during which the reserve has to come up to the attack. We have also assumed that it is only by an unbroken continued fire—no gaps, no falling off anywhere—that the enemy can be so shaken that the first movement forward of this one real rush will send him back. But what of the previous time? There is a long space to be traversed before this actual halt to pour in a continuous fire occurs, in crossing which, on open ground particularly, the losses must needs be considerable. And that these losses may be instantly filled up, and so the preparatory line of fire not left weakened, there must be the necessary material close at hand. This material is the support or supports, which are as indispensable therefore to the completeness of the formation for attack as the skirmishers or the reserve. Only, if the preliminary advance take place over broken or covered ground, the first losses will be comparatively trifling, and the supports may in such case be proportionately weak. Theory has prescribed that they should vary from half the strength of the line they follow to an equal force with it; and practical trial has proved this to be true. We may add here to Scherff's reasoning the remark that, normal rules being made for open ground, the correctness of the barrack-square formula—"Supports equal to skirmishers; reserve equal to the two together"—stands proved by his demonstration, which we may close at this point.

We have purposely confined ourselves chiefly to one passage of this work, not as possessing exceptional value, but as being on a question already familiar to all military readers. And what our author has here done for this special subject, he has done with no less clearness for the attack, or rather assault, itself; for the third stage of the advance, when the position carried has to be kept whilst the assailants are under the dangerous influence of the reaction which inevitably follows the tremendous excitement of the charge; and also for such collateral discussions as that whether the command of troops should be extended in depth or in breadth, the formations for the various bodies already spoken of, and the handling and management of the second and third lines of battle—for all that has been hitherto said relates only to the first line. Nor are the later chapters on the Defensive-Offensive, and on the merely Demonstrative Action fought to secure time, in any way inferior to that on the purely Offensive, with which we have hitherto been concerned. Gems of practical wisdom, too, lie scattered amid the author's elaborate reasonings, inviting remarks for which we regret we have no space. Such are his dismissal of the old-world notion that any officer nowadays leading troops to the attack could possibly be mounted; and his remark that the times are gone by when reserves were to wait and receive the counter attack which is driving in on them the first line that has failed; for "this is in these days mere theory; the only support actually possible of such a repulsed line is that given from the flanks."

As we have praised this work so highly, we could wish to say something of the causes which direct so much scientific thought as it displays into this one study of tactics, and of the necessity laid on those who can master it to make full use of their powers. But this we must defer until we have noticed the second part of a book the importance of which is a striking sign of one of the most marked features of the age we live in—its development of warlike arts.

BOTTRELL'S TRADITIONS OF WEST CORNWALL.*

WITH a laudable desire to save from oblivion some of those local traditions which not only afford an insight into the manners, customs, and superstitions of the past, but also help to furnish material for deciding the question of a common origin of folk-lore, Mr. Bottrell of Penzance has put forth a second series of *Traditions and Hearth-side Stories of West Cornwall*, as attractive in their way as the first, of which we took favourable notice in these pages. It is no small gain when a patient antiquary is minded to undertake a task which to most persons would be tedious; and the air of unsophistication which pervades Mr.

* *Traditions and Hearth-side Stories of West Cornwall*. Second Series. By William Bottrell. Penzance: Printed for the Author by Beare & Son, 1873.

Bottrell's work attests the *bona fide* character of his record of oral traditions. Taking a somewhat circumscribed range, a half-isolated extremity of West Cornwall, as a quarter where old local legends and folk-tales would be likely to cling with the least interruption, he has gleaned the representative traditions yet within it, whether anent black witches or white, senseless giants or sharp-witted small folk, Buccas of various grades, devils and demons with divers powers of working mischief, as well as the "pellars" and "charms" which are the animated or inanimate antidotes of those powers. To relieve the impression of sameness, the interest of these stories is further varied by a tale of a haunted house, or a phantom ship, or an unfathomed cave in which "spriggans" and "knackers" may be heard plying their weird handicrafts; and the most unromantic of readers must perforce feel an interest in the discrimination of mermaids, or spirits of the deep, that entice the sailor to his doom, from the so-called "hoopers," or friendly spirits which, shrouded in fog, in hooting or hooping accents warn the fisherman of impending foul weather. Here and there, too, the book rises to a somewhat higher aim, as where, *à propos* of the "holed stones" and "long stones"—topics with which we had to deal in reviewing Mr. W. Borlase's *Nenia Cornubia*—it discusses the original purpose of these monuments, which is surmised to be to mark hallowed ground and the resting-places of saints near whom the living may choose that their own bones should be eventually laid. The Daunce-Meyn, near Boleit, "best known" (says Mr. Bottrell, treading, as he is aware, upon somewhat doubtful ground) "of all *Druidic* circles," is not suffered by him to remain, what the common folk esteem it, a corruption for "dancing maidens," but is traced through the Cornish name for stone (mean) to the ring of *sacred stones* (*Zans Meyn*), which still marks many a place of ancient council, priestly, political, or judicial, or perhaps all three in one. The so-called "crick stones," through which it was and still is the custom to pass rickety children, are, as Mr. Bottrell agrees with Professor Max Müller, of an astronomical purpose, meant for stone calendars,

to fix the time for the celebration of the autumnal equinox, by the stones being so placed that the sacred index of the seasons, on rising above the horizon, would be seen through the perforation, at a right angle to the face of the stone, the triangular head of the stone forming such an angle that when the sun was on the meridian, its altitude would denote the time, by its place in the heavens being in a line with the slope of the primitive time-piece, which would then cast no shadow on the ground at mid-day.

In truth, we get in this amusing volume much mostentations help towards the elucidation of West country relics and monuments, as well as clues to the origin of West country superstitions—such, for example, as the strange noises and witch dances in the Fugro, a cave south-west of Treve; the Giant's Holt at Bodinnar, and the "Vow" at Pendean (haunted on Christmas dawn by a female spirit in white robes with a red rose in her mouth, immemorially supposed to visit with disaster such as intruded upon her morning walk), which are referable to smugglers' stories, invented to scare away curious interlopers "with faint hearts, weak heads, and long tongues." To some such trading on supernatural terrors in order to check the curiosity which might interfere with a very natural and normal calling in old Cornwall—the smuggling business, which, by a pleasant euphemism, goes in this volume by the name of "fair trading"—we should refer the phenomenon in the ghostly tale of the "Smugglers of Penrose" (pp. 212–23), where at the dead of Twelfth Night the house and courtyards of Penrose are convulsed with sounds as of waves breaking and surging, and "in the wailing wind is heard a noise of oars rattling in their rowlocks, and then as of the casting of oars hastily into a boat." There is something highly poetical in the image, in the same story, of a boat manned with a ghostly crew emerging from out of the driving mist; and the strange fancy about "the hollow voices of the smugglers who had been drowned with the old Squire of Penrose, hailing their own names as drowned men's ghosts are said to do when they want the assistance of the living to procure them rest" (p. 218), seems to us unique, and in contravention of Virgil's words, "*nee jam exaudire vocatos*."

Obviously to a primitive and superstitious people like the Cornish folk, there was a ready, if fanciful, "because" to every "why." According to old tradition Parcurnow, which is now nothing but sand, was once the chief port of Cornwall, and was a cove into which the largest vessels afloat could ride with ease. It was choked or sanded up, says tradition, as the sport or punishment of the wicked spirit Tregeagle, once a rascally lawyer and Cornish Bluebeard, whose endless task it is to make a truss of sand, with ropes spun of the same, and to carry it to a rock above high-water mark. The task, it should be added, is endless, because it is a proviso that Tregeagle shall not use Velan-Dreath water or any other to moisten and bind his sand-ropes; though why, as Tregeagle appears to have been in life anything but a man of his word or his bond, and only after death bore true witness in despite of himself, any promise or stipulation stands in the way of his regaining his liberty, we do not exactly see. On the other hand, it is very easy to see why so constant a tradition of devils and witches has clung tenaciously to the faith of these dwellers in the far West. The nearness to the coast, the charm of a seafaring life, with the alternative resort to mining in the bowels of the earth (a weird calling in itself), and the scant knowledge of any book-learning, unless it were "The Story of Troy Town," "The Seven Wise Masters of Greece," "Gulpepper's Herbal," and "Moore's Almanack," combine to foster a leaning towards adventure, mystery, and romance, and to shape such drolls and stories as the wandering "Uncle Antony" or Ann' Jeuney had to tell, in supernatural fashion.

Hence it is that in such stories as that of the "Cardews and Nelly Wearne" (pp. 36–58) even the intelligent reader, and much more the imaginative tinner or miner, is left in doubt even to the last whether Captain Black, who danced at Buryan fair on a stormy night with handsome Nelly, and disappeared with her after she had sworn "she would have a reel that night, even if she danced with old Nick, and find a man to dance her down, or the devil might take her," was her old lover Billy Brea of Brea, or the devil himself in disguise. Although both are heard of again after their supernatural disappearance at the moment when, amidst a terrific thunderstorm, the church bells are set ringing to drive away evil spirits, still the captain's adventures and gallantries, his roving life, his blasphemies, and his tragic death by burning as he carouses with Carn his mate in Penberth Cove, are quite startling enough to get him the character of a devil or a demoniac; and while his better half Nelly is ashore, owing either to his desertion or unwilling absence, she finds no difficulty, under the tuition of her old friend Betty Trenoweth, in getting the credit of being a white witch, and by help of simples, scagmag, and sharp-wittedness, enacting the rôle of the wise woman of Buryan Town. Around this Betty Trenoweth there hangs an uglier reputation. She was a black witch, who played her neighbours such tricks that they had to resort, by way of a counter-spell, to skewering her effigy made in dough, whereby they caused her such bodily agony that, had they not destroyed the image, she would hardly have died with the spell unbroken and with her curse upon her torturers. The terrors of such a curse may be gathered from the curious sections (pp. 230, 231) about the cursing psalms and the legend of Sir Cloudesley Shovel. Of Betty Trenoweth no more need be said, except that, when she cast a covetous eye upon her cousin Tom Trenoweth's sow, there was no help for him but to let her have it at her own price. Going over the moor in the shape of a hare, and coaxing the sow into a culvert where it could neither turn nor go forth nor get back to its master, she gained her point at a cheap rate, and the price of the sow did Tom no good, "because every shilling of the devil's coin will go and take nine more with it." Whilst upon the topic of witch-hares, it is worth while noting how large a part they play in Cornish folk-lore. In the first story in this volume it was a witch in the disguise of a hare that led Squire Lovel such a dance amid withered oaks and haunted woods. In the legend of Pendersok it is the shape of a hare that the spirit of the murdered Saracen queen assumes, and generally this timid little quadruped has a part allotted to it strangely out of keeping with its normal harmlessness. Perhaps it is an illustration of the superiority of subtlety to strength, the inferior animal vanquishing the superior, as in the Vedic hymns the dog attacks the wild boar, and the calf defeats the bull, and as in *Æsop* the hare laughs at the eagle. With this view may be compared the chapter upon the hare in the second volume of De Gubernat's *Zoological Mythology*. Certain it is that in Cornish legends the battle is not always to the strong; in the legend of Castle Treen and its giants, "it wasn't much," we read, "that the giant had to teach the youngster" he stole from Maen. "Like all of great bulk, he had more strength than knowledge; for, as we say, the best goods are bound up in the smallest bundles." All the Cornish giants are represented as kind to youngsters, fond of quoits, and ninepins, though a little rough in their play, and invariably friendly to the common folk, albeit as invariably stupid, and burdened with more strength than sense.

It is somewhat otherwise with the fairy folk or small people. One Mr. Noy, led astray by pixies into the fairy colony on Selena Moor, finds there, in the guise of cook and nurse and servant of all work, his quondam sweetheart, Grace Hutchins, spirited away through eating a fairy plum. She tells him, on the sly, that her functions are baking, brewing, keeping house, and nursing changelings for the fairy folk, the last office being needful because the changed children miss the beet and malt liquor of more matter-of-fact communities. Grace appears to be only half transformed, for her love is constant, and she tells Mr. Noy that she can and does assume any bird shape to be near him. When in the fairy dwelling Mr. Noy gets jealous of one of the old "little men's" attentions, his kidnapped sweetheart says to him, "Oh! my dear Willy, don't be such a noddys as to be jealous, for he's no other than vapour, and what he is pleased to think love is no more substantial." There are one or two other good stories in this book, about the Small People's Cow, and the Fairy Master or Widower—who appears to have been a Bluebeard in so far as he points a lesson to feminine curiosity—but none that let us so far into the little people's secrets as the "Fairy Dwelling on Selena Moor." Of the stories which, though marvellous, do not partake of the supernatural, the best to our thinking is that of a Queen's visit to Barmahall, a legend not found in any county histories. The date is not given, nor can we guess whether her Majesty was British or foreign. Anyhow, when Dame Pendar, one of the proud Pendars, declined to go to Church Town with her son and his wife and the scabbie-an-gow (A.e. tag, rag, and bobtail) to see the Queen pass through it, but stayed at home and washed the fish by Barmahall Bridge, she was rewarded by the Queen coming out of her way to visit her, eating a fish dinner with her, and taking a good many drops of brandy to keep the fish "from flowing on her stomach." In the end the Queen proves Dame Pendar's proposition, that a "queen, for all her fine clothes, is much like another woman, especially when drunk," and "staying at home" proves a better mode of sightseeing than town-trotting.

Much more amusing matter might be culled from these traditions.

but we must be contented to recommend every visitor to the West to provide himself with a volume which will prove a most welcome companion to the local handbooks. He will find it full of anecdote and illustration, adage and fable. Tom of Ohyannor's "One and All" will remind him of the Horatii and the Curiatii as well as of the "Bundle of Sticks." "A Night's Ride to Scilly" will recall tales of Scandinavian folk-lore referable to the common visitation of night-mare; and such queer superstitions as that of dropping pins or pebbles into St. Madron's Well, by way of ascertaining the future of sweethearts, may be compared with the custom at St. Winifred's Well, Holywell, and other similar places. We can promise readers of all sorts pleasure and profit from this unpretending, but entertaining and instructive, volume.

THE FAYOUM.*

THE French travel so little, that what with us is a brimming and inexhaustible stream of light literature may be said with them to run dry at its source. In a nation of rare travellers books of travel must be rare also. The shelves of French libraries do not groan as ours do under the weight of the ever-accumulating volumes in which the blatant tourist records his experiences of a "Month with the Mormons" or a "Fortnight among the Fins." It is a pity that we cannot infuse a little of our own superfluous energy in the task of surveying mankind from China to Peru into our neighbours across the Channel. We may excel them in the spirit of adventure and power of endurance which make a man a good traveller; but, on the other hand, they far surpass us in the quickness of intelligence and literary instinct which make a man a good chronicler of his travels. One of the few books inspired by travel which have attained to the dignity of a classic was written by a Frenchwoman. The work in which Madame de Staël has recorded her impressions of Germany is a brilliant monument of genius in a field of literature into which it is to be regretted that so few of her countrymen follow her.

The volume before us commemorates the visit to Egypt and the Desert of a party of French artists, whose object in going there was "to look out for subjects for pictures and to paint them." Our author expressly disavows any historical or archaeological curiosity on the part of himself and his companions. "We set out," he says, "with a deliberate intention of ingratitude towards the Ptolemies, and we should have considered ourselves ill used if, in order to paint the Pyramids, we had been obliged to reckon their strata." Naturally what most riveted the eye of an artist was the exquisite colour of the landscape, the picturesqueness of the buildings, the variety and the novelty of the groups, costumes, and spectacles which enliven Oriental life at every turn. There is a lively description in this book of Cairo, with its bazaars bright with the embroideries of native manufacture, and its streets alive with the ceaseless tumult of trotting asses, swaying dromedaries, rumbling vehicles, and struggling foot-passengers. Our travellers were present at a religious ceremony which was a grotesque mixture of barbarism and magnificence. This was the departure of the carpet annually offered to the Prophet by the Viceroy for the Holy City of Mecca. The carpet is attended by a long train of pilgrims, rich and poor, who are escorted out of the gates with the utmost enthusiasm. A procession of Court carriages, preceded by detachments of soldiers, and magnificently adorned with feathers and gilding, formed a superb prelude to the real *cortège*, while the guns, fired at intervals, emphasized the official part of this strange ceremony. The carpet itself followed, borne on a white dromedary, under a canopy glittering with embroidery and precious stones. The soldiers could with difficulty restrain the crowd of fanatics who rushed forward to throw themselves under the feet of the sacred animal. Then came the musicians mounted on beautiful dromedaries, and executing some "truly deafening" music on cymbals and trumpets. Some of them were singularly and hideously deformed. The most revolting feature in the pageant is the presence of the frightful and naked *antons*, a caste of pilgrims who are held by the populace to be saints, who have embraced this career because no other is sufficiently holy for their taste. These ugly wretches execute the strangest gambols, swinging themselves about upon dromedaries adorned with brilliant trappings. The crowd, mad with enthusiasm, breaks the line of soldiers, and men, women, and children struggle together for room to kiss the feet, the hands, the knees of the filthy monster who sits on his golden saddle, covered with grease and dirt. The women are especially conspicuous in their efforts to reach him, and to bring their clothes, their jewels, and even their children in contact with his body. It appears that the most beneficent and wonderful properties attach to contact with this melting mass of grease. Those who are too weak or too short to reach the toes of the holy man content themselves with clinging frantically to his dromedary, and assuage their pious transports by kissing and handling him. There is great rivalry in luxury among the rich pilgrims. Some were hidden in cages of gold wire, covered by a tent richly decorated. Gorgeous stuffs, emblematic banners, and fluttering ends of gold and silver tissue figure among the commonest equipments. After the procession of the rich comes that of the poor pilgrims, who, trusting in the protection of the Prophet, venture to make the long and painful journey on foot. Some very old men figure in the ranks, who, they do not die on the road,

can hardly hope to return. Many of these unfortunates wear the green turban, which is the distinctive mark of all the faithful who have already made the pilgrimage to the Kaaba of the Prophet. "We came back," says our author, "literally bewildered by these strange sights, astonished by the splendour of the decorations, but profoundly saddened by the actors, who played their parts in this apotheosis of bearded folly only too well."

The most interesting part of this volume is that in which the visit of the travellers to Mount Sinai and its monastery is described. The configuration of the Sinaitic peninsula is very curious. It consists of a series of mountain chains running almost parallel one with another, and meeting in a kind of cluster at the extremity of the peninsula. Between each of these gigantic walls are the beds of the torrents which originate in the rains or the melting of the snow. Along these narrow valleys, which are just like corridors, and which are called by the Arabs *Wadis*, the ascent is made. The light in these gorges is dim, and the echoes are wonderfully distinct. The colouring of the mountains is extremely brilliant. Their sides look as if they had been painted in vermilion or yellow ochre. On their red flanks arabesque patterns are traced in various geological layers, white, blue, and violet in colour. Our author ascended one of the reddest mountains to see whether the colouring was real or the result of an optical delusion. He found it was all quite real, and that from the top to the bottom every stone of these sharp rocks glowed like burning coal. The convent of Mount Sinai, where the travellers were most hospitably entertained, has the aspect of a great fortress, quadrangular in form, and flanked with towers. These strong defences are needed to protect it from the attack of the Arab tribes who covet its treasures. Until lately the only means of ingress was through an aperture at the top of the wall, up to which the visitor was hoisted in a basket by means of a pulley. The modern mania for embellishment has reached even Sinai, and the monks have constructed a real door "in the newest and worst taste." Our travellers found the Superior a man with fine, strongly marked features and snow-white hair and beard. He wore a long black habit, and a mitre of black felt, with a long veil attached to it, to protect his neck and shoulders from the sun. The monks were mostly old men, and their faces wore an expression of "supreme gentleness." The chief curiosities of the convent are the library, the church, and the garden. The first is a treasure-house of choice manuscripts. In the second is a chapel, erected on the spot where God appeared to Moses in the burning bush. A bright light reflected in a plate of gold is the emblem of the sublime apparition; and it is with gestures of respect and awe that the monks withdraw the veil which hides the little flame from profane eyes. In another chapel are two silver coffins, encrusted with gold enamel and precious stones, presented by the Empress Catharine of Russia. The one contains the remains of the Saint whose name she bore; the other is full of the gifts and offerings of illustrious pilgrims. Outside the church are the ruins of a mosque which the Turkish authorities had insisted on building in the interior of the convent as a sign of Ottoman supremacy. The garden is incredibly fertile and luxuriant, its mould having been all brought from Egypt on camel-back. Some of the visitors ascended to the top of the mountain, which bristles with teeth ridges and crevasses due to the action of fire and to violent volcanic convulsions. The red colour of its granite from top to bottom gives it a terrible and imposing appearance. The summit forms a plateau from which a marvellous panorama is unfolded. On the right and left are the converging crests of the whole Sinaitic chain, and beyond the two arms of the Red Sea, and in the faint distance even their opposite shores. An immense slab of natural formation is pointed out as the place where the Tables of the Law were given. The features of the locality answer precisely to the Bible record.

From Sinai our artists' caravan made its way across the Peninsula to Abakah, situated at the top of the eastern horn of the Red Sea; the *raison d'être* of which is to serve as a "colossal buffet in the Desert" for the refreshment and re-victualing of the Mecca pilgrims. Here they fell in with a Sheikh, by whose tremendous appetite the resources of their ambulatory larder and cellar were sorely tried. English mustard was the delicacy he most affected; no sooner was one pot emptied than he eagerly asked for another, like a child coaxing for bonbons. It was necessary to propitiate the mustard-loving chief, whose influence over the neighbouring tribes was great. Under the guidance of his brother the travellers made their way across the Desert to Petra, the site of which is described as an "immense block of granite" entirely surrounded by ravines and precipices. Its houses, temples, and monuments are nothing but blocks of the rock cut into or divided from each other by man's handiwork. Their style recalls the fanciful architecture of the Decadence, in which the Greek style loses its natural simplicity and grandeur in a useless exuberance of tasteless decorations. The entrance to that "monolithic city" is through a gorge so narrow that the riders had to descend from their dromedaries to avoid breaking their heads against the overhanging rocks. The dim light, and the red colouring of the mountain sides, recalled to them Dante's hell rather than the grandeur of the Roman Empire. Of the character of the inhabitants of Petra our travellers had painful experience. The place is a den of thieves. To the gluttonous propensities of the fat Sheikh of Abakah the Sheikh of Petra and his Bedouins united a pertinacity in extortion all their own. Having exhausted the strangers' caissons, and even invaded their tents, they insisted on a gift of money as a condition of escorting them on their departure out of the town. The leader of the party

* *The Fayoum; or, Artists in Egypt.* By Paul Leconte. London: Henry S. King & Co. 1873.

had to show the Sheikh an empty purse, in answer to his rapacious demand. Two of the band of robbers went on ahead and barred the way with their lances. A pistol was pointed at the dragoman, upon whose life the safety of the party, entirely ignorant of the way through these impracticable gorges and precipices, depended. It was not until three revolvers were turned upon the traitor that he withdrew his pistol and galloped away. From this point the travellers turned their faces in the direction of Syria, on the confines of which country this narrative leaves them, delighted to exchange the arid Desert for rich pastures, and Bedouin rascality for comparative honesty.

Englishmen are usually inclined to contemplate scenes famous in Bible story in a somewhat more earnest spirit than our artist authors. To such the tone of some passages in this book will appear rather commonplace and flippant. Allowance is to be made, however, for the writer's nationality. Probably no one but a Frenchman would mention Jerusalem and Bethlechem in the same breath with *Partant pour la Syrie*; just as to none but a party of French tourists would it occur to celebrate the ascent of Mount Sinai by quaffing liqueurs and singing choruses. The rearrangement of the "street nomenclature" of Petra on a new and Parisian plan, and the decoration of the street corners with "bold profiles" of the neighbouring Sheikhs, may appear to our author an innocent joke. Frivolities of this kind show that a form of vulgarity which is unfairly supposed to be typical of the Anglo-Saxon race exists with equal virulence in the most polished nations of Latin extraction.

TOM DELANY.*

MR. THYNNE, in *Tom Delany*, his second novel, keeps to those Irish characters with which he showed he was at home in his first work, *Ravenstale*. This time, however, he varies the scene by taking his Irish over the sea to Australia, and by introducing, instead of rebels, miners in the gold-diggings. The story is fairly interesting, and at times lively, though one of the characters is somewhat too mysterious to be very entertaining for long together, and though the conversations at times are spun out till they become a little dull. Tom Delany, who gives his name to the book, though he can no more lay claim to being the hero than two or three other characters, is an Irish gentleman of middle age, "who owned—nominally—half a county," which had to be sold off in the Incumbered Estates Court. It is somewhat hard to understand why he should be made the hero, for he never falls in love, as do at least four of the other male characters; nor does he get first disinherited by a passionate uncle, and then shot through the shoulder by a man in delirium tremens, as does the first of them; nor does he run away from sea and go to the diggings, as does the second; nor does he go to the diggings and marry a widow, as does the third; nor does he save a woman from a poisonous snake, and then ruin her, as does the fourth. He is a married man and the father of the heroines; like his forefathers he is of an easy-going, quiet temperament, and he is as unheroic as a man can well be. Nevertheless, as the story begins with his sad exile from his ancestral estates, and ends by his joyous return from Australia to his old mansion at Tubbermore, and as the other characters have such equally balanced claims each to give his name to the story, we do not know that Mr. Thynne has done ill in putting the name of this "elderly gentleman, short, stout, carelessly—almost shabbily—dressed" though he was, on his title-page. It was expected that the estates, when sold, "would scarcely pay the incumbrances thereon," but fortunately at the sale there was an "anonymous growl," which ran up the biddings to such a height that Tom Delany, after all the incumbrances were cleared away, had some money left, with which he, or at all events his sons, who were young men, could make a start in Australia. His eldest daughter Mary had been engaged to Henry Brabazon, the nephew and heir of Sir Hugh Brabazon, one of the old violent and hard-hearted baronets with whom we are all so familiar. We should be curious, by the way, to learn how it is that the race of baronets never seems to become better. Seeing how admirable for many years past have been their heirs whom they have at first disinherited, and then on their death-beds have forgiven, it is certainly strange that the race as a whole shows no signs of amendment. But such a question as this is too long for a passing notice, and might well be looked into by Mr. Darwin or Mr. Galton. The wicked baronet had written to Mary to tell her that on her decision to marry her nephew's fortune. If she did not give him up, he should never inherit, he threatened, a sixpence of his fortune. Mary resigned her lover and sailed with the rest of her family to Melbourne. Henry Brabazon, however, was a man of spirit and announced his determination to follow her to Australia. His uncle sent him £1 as a present, and made a fresh will in which he left him the same sum on his death. Meanwhile, on the voyage, Sophy, the second daughter, had fallen in love with Mr. Linton, the mysterious character, who appeared to be "a cold, reserved, correct, Englishman"; while Loo, the third daughter, a girl of fourteen, had formed a romantic attachment to Mr. Bayley, a midshipman who was a year or two older than herself. Mr. Bayley, as he is always called, is one of the best characters in the book, and the love-making between him and Loo is often amusing. But perhaps the most important member of the party that meets on the ship is one Captain Kinnegrad, "a middle-

aged gentleman of battered appearance." No one knew—in all probability he did not himself know—in what service exactly it was that he had gained his rank of captain. He had, however, nothing to live on, and had come to Australia to try if it was yet too late to make his fortune.

On landing at Melbourne Mr. Delany and his wife and daughters take a small house in the town, his sons go up the country, Mr. Linton gets an appointment, and soon is engaged to Sophy, while the Captain suddenly disappears. "There were," Mrs. Mary says in one of her letters, "even some rumours of 'young Bayley' intending to desert the ship when we arrived in port, and as he ate scarcely any dinner, and Loo none at all, it was whispered that they were saving up provisions for that purpose." The night the ship does start Mr. Bayley really deserts and makes for Tom Delany's house. We should mention by the by that every one calls Mr. Delany Tom—even his daughters, as, according to our author, would be usual enough in parts of Ireland. Close upon Mr. Bayley's heels comes one Doolan, a sergeant of police, who had in a telegram been directed by the captain of the ship to go to Tom's house and to arrest the runaway. Loo alone knows anything of him, but she does not of course speak. The sergeant catches sight of him, but he gets off and escapes to the diggings. There he falls in with Captain Kinnegrad, who together with a broken-down spendthrift, Lieutenant Spanker—a real lieutenant this—was earning a miserable living at mining. Spanker presently dies of dissipation and exposure, and Kinnegrad, who was a good fellow, taking poor Spanker's death as his text without in any way seeming to interfere with Bayley, yet leads him to see that he had done wrong in running away from his ship, and brings about his return in a penitent mood. Meanwhile they had formed the acquaintance of one Briggs, who kept a store, and at the same time sold spirits, without, however, having taken the trouble first to take out a licence. This gentleman was a ticket-of-leave man, and was an amiable enough character, except so far as he was generally suffering from delirium tremens. One stormy night he was oppressed with the fear that his store was going to be attacked by the natives, and he equipped himself accordingly:—

His appearance was ludicrous in the extreme. A large overcoat, reaching to his knees, was secured round the waist by a leathern belt. In this belt might be counted some half-dozen revolvers, a number of bowie knives, and a couple of "neddies"—a favourite weapon with escaped convicts and bush-rangers—all ranged completely round his person. In one hand he carried a rusty old musket, while the other bore a dark lantern. An umbrella was strapped across his back, and from each of the pockets of his overcoat protruded the neck of a brandy bottle. On the whole, Mr. Briggs had successfully combined the costume of an ancient watchman or "bobby" with that of Robin-on-Crusoe, throwing in a smack of John Gilpin.

Unhappily it so happened that this same night Henry Brabazon, who was making his way overland from Adelaide, where he had landed, to Melbourne, came near the store. Mr. Briggs, in his fright, at once shot him, and then ran off to tell the captain that he had killed a native. He is a little discomposed at finding that the Captain takes so serious a view of the matter, and that the man is not dead. At first he is for knocking him on the head with "a neddie," saying, "Them varmint has the lives of cats." Then, finding that his victim is no black, but a white man, he says, "You'll stand by me, Captin, if it's a mistake? Let's bury him, and say nothing about it." At last he begins to lament over the sad position he was in, and runs off into the woods pursued by the terrors of delirium tremens, and murmuring to himself that "it was hard on an old man as had made some property." We have no space to describe the violent end to which he soon comes. Meanwhile at Melbourne the dressmaker who was preparing Sophy's trousseau, on seeing Linton, claimed him as her husband. According to her account he had married her in France and had deserted her a short while before the story opens. The marriage is broken off, but in a few days Sophy and Linton disappear. They were tracked as far as some new diggings that had been opened in the Australian Alps. It was in winter that they fled, and on these high grounds the cold was so intense that Sophy died of the exposure. Linton is never heard of again. The story would have been a much better one, as well as one volume shorter, if the whole episode of Linton and Sophy had been kept out. We still have on our hands three sets of lovers to settle, for the Captain falls in love with Mr. Briggs's widow, who had always been far too good for her husband, while Henry Brabazon and Mr. Bayley have still a great deal of love-making to get through. News had reached the hard-hearted baronet in Ireland that his nephew had been killed in Australia. Full of remorse, and on his death-bed—for even baronets on their death-beds become remorseful—he makes another will, and leaves all his property to Mary Delany, including her father's old estate of Tubbermore, which had lately, by one of the curious coincidences of the story, come into his possession. Mary refuses to keep the property for herself, bequeathed as it had been to her under the mistaken belief of Henry Brabazon's death. In the end they marry, and Tom Delany returns once more to his old home, not to leave it again. Mr. Bayley goes back to his ship, and is forgiven by the captain and the owners. He rises in rank, and Loo grows older, and by the time the story ends it is quite clear that they will not have long to wait before they get married as well as the others. The Captain meanwhile had prevailed on Mrs. Briggs to change her name, and with great success they carried on the old store under the new name of "The Harp of Erin."

Mr. Thynne would write a good deal better if he were to moderate his taste for big words. He does not indeed offend in this respect nearly so much as many of our novelists; nevertheless he might,

* *Tom Delany. A Novel. By Robert Thynne, Author of "Ravenstale."* 3 vols. London: S. Tinsley. 1873.

with a little trouble, greatly improve his style. Why should he twice talk of the leaves of trees as "patulous"?—a word, by the way, singularly ill suited to the leaves of Australian trees, which are anything but patulous. We would suggest that he should, as a useful exercise, take such a passage as the following, and turn it into such English as could be understood by the common people:—

During these proceedings on the part of Mr. Spanker, the Captain had kept up a running commentary in the midst of his ablutions, intended entirely for himself, and, indeed, almost unintelligible to other ears, from the frequent interruptions, and half-formed words incident to the nature of his operations.

Sub jone is no doubt a mistake of the printer, but Mr. Thynne himself must be answerable for the statement that close to Melbourne there "broke the crashing of thunder as it only thunders in the tropics." The description of Australian society in most respects seems so life-like that we find it hard to believe that Mr. Thynne is writing of what he has never seen. And yet the patulous leaves and the tropical Melbourne make us suspect that, after all, Mr. Thynne has his knowledge only second-hand. Any one, too, who had been to the diggings would scarcely write of a single ship taking home "some tons of gold dust." We are sorry also to notice that there is at least one presentiment in the course of the story. Early in the first volume Sophy, when hearing some one talk of the chance of gold being found on the Snowy Mountains, where, later on, she is to lose her life, says she feels the conversation "freezing me, as if some one was passing over my grave." As a general rule, when early in a story we come across one of these presentiments, we, in our turn, have a presentiment that the story will prove to be of a very silly kind. We are glad to be able to acknowledge that in the present case our presentiment has, for once, remained unconfirmed.

AMERICAN LITERATURE.

MR. JONES'S work on the Antiquities of the Southern Indians* would be more interesting if it were more coherent and consistent in arrangement and statement, if some of the quotations were thrown into notes or appendices, and if the author presented a clearer and more complete view of his own conclusions; it would be more satisfactory if we felt able more completely to rely upon his judgment. It contains, however, a great deal of valuable and, to most English readers at any rate, novel information respecting a race rapidly perishing from the face of the earth, which had no doubt its history if we could but trace it, its place in ethnology if it were possible to fix it, and a knowledge of whose language, ideas, and customs is necessary to any thorough solution of the larger problems of anthropology. The tribes occupying the Northern part of the New World, from the frontiers of Mexico to the frozen regions, are clearly distinguishable from any of the Southern aborigines. The latter were capable of civilization, and even possessed a civilization of their own, as distinct from that of Oriental races on the one side as from that of Europe on the other. They were softer and weaker in character than the tribes to the north of the Rio Grande, but they were not destitute of military courage, and were capable of a much higher organization, civil as well as military, than the latter. They could form empires where the Red Indians, commonly so called, could at best only form loose confederacies; they built cities and temples where the latter could but set up wigwam villages; they had a refined mythology in the place of a simple creed overlaid with rude superstitions. Above all, they were patient of labour, and have therefore left vast monuments instead of a few scattered relics; and they endured slavery, so that they have survived conquest, and, mingling with their conquerors, form generally a considerable, in some cases a decidedly predominating, element in the present mixed population. The wild and high-spirited warriors and hunters who formerly roamed over the vast territory now included in the United States neither had any civilization of their own nor, save in a few exceptional cases, were capable of accepting the civilization imported from Europe. They would not work for the intruders, and therefore could not live and mingle with them; they would not work for themselves, and therefore were driven inland as the spread of settlement drove back the game on which they lived; and they perished, as savages always do, from the war, disease, and drink that civilization brought in its train. The Northern tribes are best known to us, but known only in their decaying state, through the romances of Cooper and the sketches of Oatlin. The tribes of the Southern States evidently belonged to the same race with the Mohawks and Mexicans of Cooper; but they seem to have been a little more intelligent and to have been organized in larger masses. Settlement, too, made slower progress in the South, and was longer in driving them completely from "the graves of their fathers," so that more is known of them in their original and unbroken condition. Their tribal organization seems to have resembled in many respects that of the Hottentots which has its antitypes in all primitive societies except those of the negro race. Save in Africa, the existence of despotic power implies a considerable degree of progress in social organization; the chief of a nation of warriors, whether Acheans, Africans, Gauls, or Cherokees, can rule only by the support, and therefore can act only with the consent, of his people. Thus great reverence seems to have been paid to the Mico

or prince of a Georgian tribe; but he could not determine any important question save in the assembly of the village and by the consent. The hunting-grounds were common to the whole tribe on confederacy, but each village had its own clearing, and each family a temporary right in the ground it cultivated. The existence of public stores, moreover, which supplied the forces of the tribe on the war path, and relieved its wants in time of famine, implies either public lands, or a rude sort of taxation, probably levied in the form of freewill offerings to the chief, really secured by the very effective compulsion of custom. The cultivation was of the rudest, chiefly done by the women, and applicable only to a virgin and exuberantly fertile soil. The instruments of the Indians were all of stone; for copper, though known to them, and so abundant in the district of Lake Superior that, if an object of commerce, it might have been procured in sufficient quantities, is too soft for practical use among a people unacquainted with tin. Greenstone, chert (in the absence of true flint), quartz, and obsidian were the principal materials of their rude axes, chisels, hoes, picks, adzes, and warlike implements. The heads of the axes and hoes, and the points of spears and arrows, seem generally to have been fixed in split handles of wood, and tightly bound to them, though numerous examples of pierced stones have been found. Mr. Jones, however, argues from the smallness of the holes, which would not admit a wooden handle of adequate strength, that several of these could only have been used for ceremonial purposes; as may have been the case with the few implements of copper, which rarely show signs of work. The principal use for which the tools were required was to hew down the trees, which, closely laid together and fixed in the ground, sloped upwards till they formed, in the centre of the cabin, a hole through which the smoke of the fire might escape; and to fashion the dug-out canoes, often of considerable size, which superseded with the Southern tribes the light, small birch-bark boats of the North. The products of the recent Stone Age of America closely resemble those of the Stone Age of Danish kitchen-middens and Swiss lake villages; and accurate descriptions by eye-witnesses of the manner in which spear-heads and arrow-points were actually made, within the memory of living men, probably apply as correctly to the workmanship of six or ten thousand years ago. This part of the book is especially valuable. Great interest also attaches to the relics of primitive poetry and weaving. The burial customs of the Indians must have been strikingly various—incineration, sepulture in every posture, stone tombs and bark coffins, tumuli of earth, shells, and stones all prevailing among the same race, unless Mr. Jones has confounded the tombs of Indians with those of the Mound-builders, as seems here and there possible.

The last-named author seems unable to make up his mind whether the mound-builders were or were not the ancestors of the tribes who succeeded them in their possession. The author of *Pre-historic Races** is in no such perplexity; nor do we think that any one who compares the two will long remain in uncertainty. The vast size of the mound works, their enormous number, and their elaborate formation imply conditions wholly unlike those described in the volume already noticed. They imply not a thin population of free hunters and warriors, obtaining a fairly comfortable but uncertain subsistence by the chase and fishing and a scanty agriculture, but a vast nation, well fed by the labour of a portion only of its available numbers, and therefore able to spend immense toil on such constructions; governed probably by powerful princes able to dispose of the exertions of their people at their pleasure; and, if Dr. Foster is right, an extensive empire under a single rule, able to rely on the frontier defences for the security of the interior. We have lately noticed other works on this subject, and it will therefore suffice to state in this place that Dr. Foster's book is one of the best and clearest accounts we have seen of those grand monuments of a forgotten race, and to note its peculiar merits. The most important of these is the distinct judgment expressed on the purpose of these works. They may be divided into three classes; the animal mounds, or imitations of animal forms in rude but gigantic earthworks, chiefly to be found in Wisconsin to which it is difficult to assign any object except one of religion or commemoration; those which, square or round in shape appear to have been intended as the foundations of temple-obscureatories for the worship of the heavenly bodies, or of dwellings (often crowded together in such numbers that we can hardly assign any but the latter purpose), and yet not entrenched; and those works which are distinctly entrenchments, often containing mounds of the second class. It is possible, we suppose, that the mounds of the second class may have been separately stockaded, and in that case they would have been easily defensible; but where several are found near together with no entrenchments connecting them, it is difficult to think that defence was their primary purpose. On the other hand, the earthworks which enclose great spaces of land generally appear by their form and location to have been fortifications; and Dr. Foster observes that they rarely appear in the centre of the region occupied by these monuments, but rather on its northern border, where the empire would be chiefly exposed to the incursions of warlike enemies. To the question what has become of the builders, the author replies by citing traditions of the early and more civilized possessors of Mexico, which indicate that the once occupied a much more northerly settlement, and were driven

* *Antiquities of the Southern Indians, particularly of the Cherokee Tribe.* By Charles C. Jones, Junr. New York: Appleton & Co. London: T. Fisher & Co. 1873.

* *Pre-historic Races of the United States of America.* By E. W. Foster, LL.D. Author of the "Physical Geography of the Mississippi Valley," &c. Chicago: Chicago & Co. London: T. Fisher & Co. 1872.

thence by conquering enemies. The absence of any relics of stone buildings on the mounds, compared with the grand stone ruins of Mexico, forms an obstacle to the identification of the earlier Mexicans with the mound-builders; but it is barely possible that a people who built entirely with wood in an alluvial country might learn to erect vast buildings of stone in one of a different character. And a long period may have elapsed between the ejection of the mound-builders and the Aztec conquest of Mexico—a period sufficient to account for great changes in the habits of the emigrant race. For we know at least that two successive forest growths have covered many of the mounds since they were abandoned, each of which must have occupied centuries, and may have occupied almost any length of time. The Indians appear to have had no tradition of the mound-builders, no story of their conquest, no legend even to account for the existence of the mounds. "Our fathers found them here when they came" is surely not the sole reminiscence of a great war and of the conquest of a civilized people and a fortified empire that would linger among the children of the conquerors. Such an answer seems to imply either the interposition of a second race and a second extermination, or an enormous lapse of time, sufficient to extinguish the very memory of such a history as always lingers longest in the minds of a warlike race—a history too of which the monuments were always under their eyes.

Dr. Hadley, Professor of Greek in Yale College, seems by the volume before us* to have been a deeper student and a more thorough inquirer than are the majority of those who rank as scholars and teachers of scholarship in America. Papers such as those on the Ionian Migration, Greek Rhythm and Metre, and Italians and Greeks (the last a severe criticism on a rash aspirant who had ventured to explain the connexion between Greek and Latin without the intervention of Sanskrit), show a fondness for his work and an earnestness of original research not too common among American scholars, and perhaps not likely to win for him very many readers among American students; while the latter-half of the volume sufficiently vindicates him from the suspicion of mere pedantry. The least valuable part of the collection, but not the least amusing, is the "Class Decisions" in which the author passed judgment on questions which had been debated, or on which essays had been read, by the students under his presidency, giving as they do a glimpse of American College customs, and of the processes by which American thought is formed upon topics of everyday conversation.

Orations on every occasion and on every subject are among the necessities of American life; and it is the practice of Americans on every opportunity to collect the largest number of the greatest available celebrities to "orate." Political magnates doubtless enjoy the first place in public favour, as being the best known; and next to them apparently come successful projectors like M. Lesseps or Mr. Cyrus Field, especially when their achievements are of a character to impress the popular imagination rather than to gratify the prosaic sentiment of shareholders. But any one whose name has figured in print may expect to be called upon if caught. James Fisk was not too suspicious, nor would a cardinal, if available, be too sacred, a character to be paraded at a prizegiving, a Fourth of July, or a centenary celebration. If any class of persons known to the public might claim to be exempted, we should suppose that claim would be accorded to poets. No one on this side of the water would dream of entrapping Mr. Tennyson into a public harangue; and of his brethren the few who are not reticent would hardly be invited—Mr. Tupper, perhaps, excepted. And, of all conceivable poets, Mr. Tennyson's predecessor in the Laureateship is the last with whom any one would dare to take such a liberty. Yet we find from the volume before us† that the so-called "American Wordsworth," on whose cold dignity and icy repose the Fable for Critics lays so much stress, has in his time been obliged to deliver no fewer than nineteen *Orations and Addresses*, and that he, or probably some one else, has thought it desirable to collect and reprint them. Not only on purely literary subjects or professional occasions, as when memorial honours were to be paid to Shakespeare, Scott, Cowper, or Washington Irving, but at a Kosuth Banquet, in front of a Morse statue, on an electric telegraph, or a mercantile library, have the services of one of the first and gravest of American poets been put in request by Buncombe; and the invitation of the sovereign power of America, like that of other sovereigns, is a command. All Americans have to learn to speak, as all Englishmen must learn to write, if they would figure creditably in the world in which their lot is cast; and Mr. Bryant, being an abler man than the majority, probably speaks better. But we cannot see that he speaks well enough to make his speeches worth preserving, and we are sure that this volume will add nothing to the reputation won in a widely different field.

We have before us several volumes of travel, all by ladies. "O. C. B." discourses of *France and Her People*‡ in a spirit happily rare among authors, if common enough among a certain class of travellers. She is a no less eager courtier, and a much more devout Imperialist, than the famous Correspondent of the *Daily Telegraph*, and the greater part of her book is occupied with the glorification, not to say the canonization, of the Emperor, the Empress, and the Prince Imperial, not to mention their horses and cattle, their

houses, clothes, and servants. At every step she falls in with some old soldier who has received a long-denied pension from the personal bounty of the Emperor, or some old woman made happy for life by the judicious and discriminating charity of "our good Empress," or some nurse who can tell a touching story of the infantine virtues of the young heir to a great name and dubious fortunes. She was in France during the earlier scenes of the war, and witnessed in Paris the revolution of the 4th of September, when she was utterly astonished by the base ingratitude of the people to the Emperor who had just locked up one army in Metz and surrendered another at Sedan. Renegade Republicans always make the most abject of courtiers, and "O. C. B.'s" servile worship of the Imperial Court outdoes even the ordinary servility of the class of travellers to which she belongs, and among whom unhappily Englishmen as well as Americans are to be found.

Even more offensive than this extravagant admiration of a foreign despot is the rampant turbulence and ill-breeding of Miss Kate Field—a violent advocate of woman's rights, who vindicates the privileges of her sex by a volume of insults to English monarchy, and sneers at English loyalty, of which we hope and believe no American man of equal education and social standing would be guilty. Her one object of admiration in this country is Sir Charles Dilke, whose "manly courage" in publishing mischievous fictions which half an hour's inquiry would have enabled him to correct moves her to the warmest enthusiasm; and, next to the English of the better orders generally, she seems to despise and abhor the working-men who refused to listen to libels on their Sovereign, and silenced the libeller somewhat too roughly. It does not appear to occur to her that proposals to overthrow the existing order of society are not in any country, and least of all in America, decided by free discussion. Nor does she vouchsafe to tell us how an advocate of Monarchy would be received in the House of Representatives. There are passages in the book which we think must have escaped the attention of the English publisher.

Miss Greenwood's *New Life and New Lands*§ deals exclusively with the Western regions of her own country; and we have noticed too many narratives of the journey by the Pacific Railway through the alkali desert, Mormondom, and the Rocky Mountains, and too many descriptions of Californian society and scenery, to go over the ground again, or trouble our readers with life and lands which certainly would not be new to them.

Mrs. Beecher's *Motherly Talks with Young Housekeepers*¶ is a sensible, kindly, useful book, offering much wholesome advice to young wives of little experience in a country where servants are few, dear, bad, and ignorant, and where the mistress must be able to do everything herself, in order that she may show a succession of raw Irish helps how to do it. There are few traces either of Mrs. Stowe's doctrines or of Mr. Beecher's style in this simple and serviceable work; but a few unconscious hints, here and there, are of a rather unpleasant character. The especial caution given as to the means of distinguishing the lower end of the sheet from the upper, for example, suggests that it would have been well to give some hints as to personal cleanliness which might diminish the importance of the distinction. The whole work gives us an idea that American ladies, except the very wealthiest, have rather a hard time of it, and that the English housewife who has a decent maid-of-all-work has more real comfort and ease on 300*l.* a year than her Transatlantic sister with 5,000 dollars.

The journey "from Ocean to Ocean,"§ of which the story is so well told by the Rev. G. M. Grant, has a political as well as a geographical significance. The colony of British Columbia agreed to join the Dominion on the condition that within ten years an intercolonial railway should be completed from sea to sea; a condition essential to the reality of any union between the settlements on the Pacific coast and the Eastern provinces of the Dominion. The country was very little known; the maps of it which have figured as authentic in one atlas after another being derived chiefly from Indian sketches on birch-bark, and a great part never having been traversed by white men. The line from coast to coast had never been surveyed, even so far as to ascertain the possibility, or the proper direction, of a railway. But this much was generally known—that, in place of the vast deserts of the interior of the United States, there was a great uninhabited belt, North of the boundary, of extraordinary fertility, and capable of supporting millions of inhabitants; and that along a considerable part of the route lakes and rivers supplied a practicable water communication. Several isolated exploring parties had gone forth, returned, and reported on various portions of the route, before Mr. Sandford Fleming, chief engineer of the projected railway, determined to traverse the entire Continent with two companions, with a view of ascertaining roughly the practicability of the country, and combining the observations already made. Mr. Grant accom-

‡ *France and Her People*. By C. C. B. Philadelphia: Evans & Co. London: Sampson Low & Co.

panied him as secretary, and took copious notes of the incidents of the journey. These were "not intended for publication," yet the author could hardly doubt that the public would insist on seeing them, and at any rate has thrown them into a coherent and readable form. They are illustrated by a number of partial maps and sketches, and give a very lively idea of the character of the vast region traversed by the expedition, of its immense value, and its capacity of supporting a nation not less numerous or wealthy—and, perhaps, from the absence of the striking diversity of interests existing in the neighbouring Republic, more united—than its Southern rival. In short, if Great Britain can and will keep its territories out of the clutches of the United States, the Dominion may, in the course of the next century, become the second, if not the foremost, State in the New World, and rival some of the richest and largest empires of the Old.

Messrs. Osgood publish a copious and serviceable Handbook for New England,* reminding the public of the too commonly forgotten fact, that that comparatively tame and settled region, like some similarly situated parts of the mother-country, contains natural scenery as magnificent and as well worth visiting as any of the favourite resorts of tourists, sportsmen, and adventurers.

Mr. G. L. Vose† is the author of what seems to be a valuable Manual for Railroad Engineers. A notable feature in its arrangement is the separation from the text of the plans and diagrams, which, instead of being pasted into the volume, where they are difficult to consult and easily torn, are contained in a box made exactly to resemble the book itself, and bearing the appearance of a second volume.

Of the three works of fiction on our list this month, *Lore in the Nineteenth Century*‡ consists chiefly of a series of letters on literary, social, and general questions, supposed to pass between two lovers more polioptic than affectionate; *Against the World*§ is one of those ladies' novels in which American "tall-talk" and extravagance of language contrive to produce something more unlike real life than even their English congeners; and *Margaret*|| (not by the author of *Orley*) is a new edition of the work of which Mr. Lowell speaks in the lines:—

'Tis enough that I look
On the author of *Margaret*, the first Yankee book
With the soul of Down East in't, and things further East
As far as the threshold of Morning, and least.

* *New England: a Handbook for Travellers: a Guide to the Cities and Popular Resorts of New England, and to its Scenery and Historic Attractions; with the Western and Northern Borders from New York to Quebec.* With 6 Maps and 11 Plans. Boston: Osgood & Co. London: Trilmer & Co. 1873.

† *Manual for Railroad Engineers and Engineering Students; containing the Rules and Tables needed for the Location, Construction, and Equipment of Railroads, as built in the United States.* By George L. Vose, Professor of Civil Engineering in Bowdoin College. Illustrated with 165 Woodcuts and 37 large Plates. Boston: Lee & Shepard. London: Sampson Low & Co.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newagent, on the day of publication.

THE SATURDAY REVIEW

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 931, AUGUST 30, 1873:

Ministerial Changes.
The Duke and Duchess of Brunswick.
The Fusion, the Church, and the Government.
The Edinburgh Working Men's Meeting. French Generals and Republicans.
The Coal Question. The Bank Forgeries.
Accident upon Accident.

Sports and Studies. Archaeological Excursions.
Report of the Commission on Scientific Instruction. The Wheat Crop.
Baton-Holling. Iceland Politics. England in Harvest Time.
The Marriage Laws and their Working. The Competition Mania.
Russian Soldier-Bows from Turkestan.

Mason's Life of Milton. Wells's Poems.
The Middle-Aged Lover. The Campaign of Scotland.
Scherer's Infantry Tactics. Botanical Traditions of West Cornwall.
The Paycock. Tom Selwyn.
American Exhibitions.

CONTENTS OF No. 930, AUGUST 23, 1873:

Electioneering Prospects—The Canadian Scandal—The Changes of the Fusion—Spain and her Neighbours—Sir Samuel Baker's Expedition—General Duerst—The Army and its Difficulties—Death in the Milk Can.

Mr. Gladstone at Moli—Holiday Tragedies—Re-election of Ministers—Pleasures of an Autumn in Spain—Bishop Reinkens's Pastoral—Seigneur Ock on "Bottions"—Vestiges of Cæcilius—The Schumann Festival—Art at the Vienna Exhibition.

Tenfel's History of Roman Literature—Tristram's Land of Moab—A Simpleton—Life of Mohammed—Tulloch's Rational Theology in England—A Seaside Excursion in Ancient India—Chronicles of St. Albans—Strangers and Pilgrims.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRÆTORIUM," with "Night of the Crucifixion," "Christian Martyrs," "Francisco da Rimini," "Nemphylæ," "Andromeda," &c., at the DORÉ GALLERY, 38 New Bond Street. Ten to Six—Admission, 1s.

ELIJAH WALTON.—EXHIBITION including "A Storm at Sea" and "Sand Storm in the Desert," and many new and important Drawings, Alpine, Eastern, NOW OPEN at Burlington Gallery, 191 Piccadilly. Ten to Six—Admission, with Catalogue, 1s.

BRITISH ASSOCIATION for the ADVANCEMENT of SCIENCE.
71 Albemarle Street, London, W.

The next ANNUAL GENERAL MEETING will be held at BRADFORD, commencing on Wednesday, September 17.

President Designate—Professor A. W. WILLIAMSON, Ph.D., F.R.S., F.C.S., in the place of J. P. FOURNIER, D.D., F.R.S., who has resigned the Presidency in consequence of ill-health.

NOTICE to CONTRIBUTORS of MEMOIRS.—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organizing Committees for the several Sections before the beginning of the Meeting. It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several communications, that each Author should prepare an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and that he should send it together with the original Memoir, by book-post, on or before September 1, addressed thus:—General Secretaries, British Association, 71 Albemarle Street, London, W. For Section..... If it should be inconvenient to the Author that his Paper should be read on any particular day, he is requested to send information thereof to the Secretaries in a separate note.

G. GRIFFITH, M.A., Assistant General Secretary, Harrow.

ST. THOMAS'S HOSPITAL, Albert Embankment, Westminster Bridge, S.E.—The MEDICAL SESSION for 1873 and 1874 will COMMENCE on Wednesday, October 1, 1873, on which occasion an INAUGURAL ADDRESS will be delivered by Dr. J. HARLEY, at Two o'clock.
Gentlemen entering have the option of paying £40 for the First year, a similar sum for the Second, £20 for the Third, and £10 for each succeeding year; or, by paying £100 at once, as becoming Perpetual Students.

MEDICAL OFFICERS.

Honorary Consulting Physicians.—Dr. Barker and Dr. J. Risdon Bennett.
Honorary Consulting Surgeon.—Mr. Frederick Le Gros Clark.

Physicians.—Dr. Peacock, Dr. Bristowe, Dr. Clapton, Dr. Murchison.
Obstetric Physicians.—Dr. Barnes.
Surgeons.—Mr. Simon, Mr. Sydney Jones, Mr. Croft, Mr. MacCormac.
Ophthalmic Surgeon.—Mr. Schrevel.
Dental Surgeon.—Dr. Stone, Dr. Ord, Dr. J. Harley, Dr. Payne.
Assistant Obstetric Physician.—Dr. Gervin.
Assistant Surgeon.—Mr. F. Mason, Mr. Henry Annot, Mr. W. W. Wagstaffe.
Dental Surgeon.—Mr. J. W. Elliott.
Resident Assistant Physician.—Dr. Evans.
Resident Assistant Surgeon.—Mr. A. W. Jones.
Apothecary.—Mr. R. W. Jones.

Medicine.—Dr. Peacock and Dr. Murchison. Surgery.—Mr. Sydney Jones and Mr. MacCormac.
General Pathology.—Dr. Bristowe. Physiology and Practical Physiology.—Dr. Ord and Dr. John Harley. Descriptive Anatomy.—Mr. Francis Mason and Mr. W. W. Wagstaffe.
Anatomy in the Dissection Room.—Anatomical Lecturers, Mr. Halsey and Dr. R. W. Reid.
Practical and Manipulative Surgery.—Mr. Croft. Chemistry and Practical Chemistry.—Dr. A. J. Bennet.
Medicine.—Dr. Barnes. Physics and Natural Philosophy.—Dr. Stone. Materia Medica.—Dr. Clapton. Forensic Medicine and Hygiene.—Dr. Stone and Dr. Gervin. Comparative Anatomy.—Mr. G. Stewart. Ophthalmic Surgery.—Mr. Schrevel. Botany.—Mr. A. W. Jones.
Mental Diseases.—Dr. Wm. Rhye Williams.

T. B. PEACOCK, M.D., Dem.

R. G. WHITFIELD, Medical Secretary.

For Entrance or Prospectuses, and for information relating to Fees and all other matters, apply to Mr. WHITFIELD, Medical Secretary, St. Thomas's Hospital, S.E.

ST. BARTHOLOMEW'S HOSPITAL and COLLEGE.

The WINTER SESSION will begin on Wednesday, October 1.
The Clinical practice of the Hospital comprises a service of 710 Beds, inclusive of 24 Beds for Convalescents at Highgate.
Students can reside within the Hospital walls, subject to the College regulations.
For all particulars concerning either the Hospital or College, application may be made, personally or by letter, to the REGISTRAR, at the entrance of the College.
A Handbook will be forwarded on application.

BRITISH MUSEUM.—The BRITISH MUSEUM will be CLOSED on the 1st and RE-OPENED on the 8th of September, 1873. No Visitor can be admitted from the 1st to the 7th of September inclusive.
British Museum, August 28, 1873. J. WINTER JONES, Principal Librarian.

QUEEN'S UNIVERSITY IN IRELAND.

QUEEN'S COLLEGE, Galway.—The SESSION 1873-4 will commence on Tuesday, October 21, when the Supplemental, Scholarship, and other Examinations will be proceeded with, as laid down in the Prospectus.
The Examination for Matriculation in the several Faculties of Arts, Law and Medicine, and in the Department of Engineering, will be held on Friday, October 24.
Further information, and copies of the Prospectus, may be had on application to the REGISTRAR.

By Order of the President,

Queen's College, Galway,
August 21, 1873.

T. W. MOFFETT, LL.D., Registrar.

QUEEN'S COLLEGE, 43 and 45 Harley Street, W.
Incorporated by Royal Charter in 1853, for the General Education of Ladies and for granting Certificates.
Visitor.—The LORD BISHOP of LONDON.

Committee of Professors.

Rev. J. LLEWELYN DAVIES, M.A., Principal.
Sir W. Stensdale Bennett. Rev. A. W. Wilby, M.A.
Rev. T. A. Cock, M.A. Rev. E. H. Plumptre, M.A.
Henry Craik, M.A. W. Cave Thomas.
Rev. Francis Gardin, M.A. G. Trench.
John Hullah. Henry Warren, J. F.
Alphonse Mariette. Gustaf Wehl, Ph.D.

The College will RE-OPEN for the Michaelmas Term on Monday, October 6.
Prospectuses may be had on application to Miss GROVE, at the College Office.
CLASSES in Greek and Conversation Classes in Modern Languages formed on the entry of six names. Individual instruction in Vocal and Instrumental Music.
Boarders are received on the College premises.
The Assistant-Secretary will attend on and after September 27 to answer personal inquiries.
E. H. PLUMPTRE, M.A., Dean.

QUEEN'S COLLEGE SCHOOL, 43 and 45 Harley Street, W.
For GIRLS between Five and Fourteen. The School will RE-OPEN for the Michaelmas Term on Monday, September 23. Prospectuses may be had on application to Miss GROVE, at the College Office. Boarders received on the College Premises.
E. H. PLUMPTRE, M.A., Dean.

OWENS COLLEGE.—The NEXT SESSION commences on October 7. Prospectuses of the several departments of the Day Classes, Evening Classes, and Medical School, and of the Scholarships and Entrance Exhibitions tenable at the College, will be forwarded gratis on application.

The CALENDAR of the College, containing full details respecting the courses of Study, Entrance Exhibitions, Scholarships, and Examinations for Degrees in the University of London, &c. may be obtained from Mr. CONNOR, Pirbright, Bookseller to the College, or other Booksellers, and at the College. 2s. 6d.; by post, 3s. 10d.

J. G. GREENWOOD, Principal.
J. HOLME NICHOLSON, Registrar.

NOTICE.—ROYAL SCHOOL of MINES, Jermyn Street, London.—The TWENTY-THIRD SESSION will begin on Wednesday, October 1. Prospectuses may be had on application.

TRENHAM REEKS, Registrar.

LONDON INTERNATIONAL COLLEGE, Spring Grove, near Isleworth.—The AUTUMN TERM COMMENCES on September 1.—Further information may be obtained by applying to Dr. LEONARD SCHMITZ, the Principal, at the College.

MALVERN COLLEGE.

President and Visitor.—The Lord Bishop of WORCESTER.

Head-Master.—The Rev. ARTHUR FAHER, M.A., late Fellow and Tutor of New College, Oxford.

There are Two Departments.—the CLASSICAL and the MODERN. Pupils are trained for the Universities, the Civil and Military Examinations, and the Professions.

There is a LOWER SCHOOL preparatory to either Department, a Gymnasium, &c.

There are Five Boarding Houses within the College Grounds, occupied by the Head-Master and four of his Resident Staff.

Board and Tuition under Fourteen, £80; over Fourteen, £90. For Non-Shareholders an extra Fee of £5. Special advantages for Sons of Clergymen and Home Boarders.

Annual EXAMINATION for SCHOLARSHIPS including at least Two of £80 per annum, in December.

For further information, apply to the HEAD-MASTER.

The Next Term will begin on Friday, September 19.

TRINITY COLLEGE, GLENALMOND, Perth.

Warden.—Rev. R. THORNTON, D.D.

A School on the model of the greater Public Schools in England. There is a resident Medical Officer. For particulars apply to the WARDEN.

The School will meet on Tuesday, September 3.

BLACKHEATH PROPRIETARY SCHOOL.

President.—The Rev. JOSEPH FENN.

Principal.—The Rev. J. KEMPTHORNE, M.A., late Fellow of Trinity College, Cambridge.

Second and Mathematical Master.

The Rev. R. J. FRANK, M.A., Fellow of Gonville and Caius College, Cambridge.

Assistant Master.—Mr. T. BARNES, M.A., late Scholar of Lincoln College, Oxford; Mr. ALFRED TUCKER, B.A., Magdalen College, Cambridge; Mr. E. E. SUTROS, B.A., Trinity College, Dublin; Mr. W. R. BURGESS, B.A., Queen's College, Oxford.

SPECIAL DEPARTMENT.

Head Master.—The Rev. J. MORGAN, LL.D., Trinity College, Dublin.

Assistant Master.—Mr. M. SHAYLOCK, B.A., Pembroke College, Cambridge.

Instructor in Physical Science, Chemistry, &c.—Mr. H. WOLFFRAM.

English and Writing Master.—Mr. H. FARLAND.

French Master.—Mr. R. GERRIE; Mr. T. ORLANDER, B.D.

German Master.—Mr. F. OSFANDER, B.D.

Drawing Master.—Mr. L. J. STEELE; Mr. JOHN AULD, Jun.

Geometrical Drawing Master.—Mr. H. WOLFFRAM.

Exhibitions of £50 each, tenable for three years, are awarded every year to pupils proceeding to the Universities.

Classical and Mathematical Scholarships of £100 are also awarded every year.

The NEXT TERM commences Thursday, September 11.

Particulars as to the various Terms, Boarding Houses, &c., may be obtained on application to the PRINCIPAL, or by letter to the Secretary, T. A. BUCKLE, Esq., Proprietary School, Blackheath, London, S.E.

N.B. Parties desiring the admission of Pupils are requested (if possible) to send in their applications to the SECRETARY on or before September 3.

PREPARATORY SCHOOL for BOYS, Saugeen, Bournemouth.

A First-Class PREPARATORY SCHOOL for BOYS will be opened on September 25 next, by the Rev. E. B. BRACKENBURY, of Exeter College, Oxford (late Minor Canon of Bristol Cathedral), who has been engaged for several years past in Tuition, and has undertaken the charge of the School, carried on to the present time by E. J. SANDERS, Esq., The Cedars, Bournemouth.

The house stands on the East Cliff, facing the Sea but sheltered on every side by the pine woods.

Bournemouth is now specially recommended by Medical Men for Children of delicate constitution, and the house has been most carefully built, and arrangements made, by means of hot-water apparatus, so that delicate Boys may have every comfort and convenience.

There are first-rate French, German, Music and Drawing Masters, and in the case of Boys possessing a good ear and voice, the Rev. E. B. BRACKENBURY will be very glad to take special pains in teaching them to sing from note, to qualify them (if necessary) for the various Choral Scholarships that are to be obtained at different Schools.

There are Three Vacations in the year, viz.: five weeks at Christmas, three at Easter, and seven at Midsummer.

Terms, 90 Guineas. Day Boys, 30 Guineas. But special arrangements would be made with Parents bringing their Children to Bournemouth for a short period.

For references to Parents of former Pupils, and for further particulars, apply till September 5 to the Rev. E. B. BRACKENBURY, 2 Cambridge Park, Redlands, Bristol; and after that date, Saugeen, Bournemouth.

GARRICK CHAMBERS.—The next Term will commence on September 17. The Honour List for the years 1869-1873 contains the Names of 127 SUCCESSFUL PUPILS, appointed to the following Departments:

67 to the Civil Service of India.

12 to the Diplomatic Service.

12 to the Foreign Office.

31 to other Superior Offices of the Home Civil Service.

11 to the Civil Service of India and to Chinese Interpretships.

3 to the India Engineering College.

Of this number 33 gained the First place in their respective Competitions.

The List may be had on application, by letter, to the LITERARIUS, Garrick Chambers, Garrick Street, London.

OXFORD DIOCESAN SCHOOL, Cowley, near Oxford.

Visitor.—The Lord Bishop of OXFORD.

A Public School, limited to One Hundred Boys, who are prepared for the Universities, Military or Civil Service Examinations, for the Professions and Commerce.

The Terms are 21s. a year, which includes Board, Education, Laundry, &c.

A Prospectus and particulars may be had of the PRINCIPAL.

The Next School Term begins on September 1.

EDUCATION.—GRESWELL LODGE, Grove Park, Chiswick.

Mrs. and Miss GRESWELL receive a limited number of YOUNG LADIES. The course of instruction combines refined and careful training, so to educate the religious, moral, and mental powers as to make the Pupils highly useful members of society.

The young Ladies are under the individual supervision of the Misses GRESWELL, assisted by competent and trustworthy Resident English and Foreign Governesses. Backward and delicate Pupils are the immediate care of Mrs. GRESWELL.

Gifted Young Ladies are also prepared for higher accomplishments. Most satisfactory references to Parents of Pupils and also by blank permission to the Hon. Mr. Justice Leake, Barrister at Law, Avenue Road, St. John's Wood, London; to Dr. John Alfred Leake, M.P., Salisbury; to Mr. W. L. Lorne, Esq., of St. Paul's, Grove Park West; Henry Norton Cotton, Esq., 5 Lexington Square, London.

EDUCATION, SUPERIOR.—THE WICK, Brighton.

The following Distinctions have been recently obtained by PUPILS of this School, viz.: Balliol Scholarship, Woolwich Cadetship, and in the last Examination, 2nd class in the last Classical Moderations, &c. &c. House stands in its own grounds of eight acres. Superior Grammar School. A Junior department for Pupils preparing for Public Schools. For Terms, apply to the PRINCIPAL, The Wick, Brighton.

COOPER'S HILL, DIRECT COMMISSION, OCEAN WRITERSHIP, MATRICULATION, CIVIL SERVICE, &c.—Mr. W. M. LESTON

(Author of English History and Arithmetic for Competitive Examinations) has posted up PUPILS for all the above Examinations.—Address, South Hill Park, Hammersmith, N.W.

WOOLWICH.—ARMY DIRECT and CIVIL SERVICE.

Rev. Dr. HUGHES (Wrang. Cant.), who has had Twenty years' experience in the Army, for the above, receives TWELVE YOUNG MEN. Entirely separate TENANTS.—Address, W.

COOPER'S HILL COLLEGE.—The following are the Names of some of the SUCCESSFUL COMPETITORS at the recent Examination for admission to the Indian Civil Engineering College:

Names.	Marks.	Names.	Marks.
Simeon, Lionel Barrington	1868	Stewart, Robert	1864
Oldie, Henry James	1869	Holmes, Charles Henry	1869
Reynold, George Edward	1861	White, John Claude	1868
Quide, Montgomery	1872	Johns, Edward Henry	1863

Pupils of Mr. J. ASHTON, 41 King Henry's Road, N. Hammersmith, who receives RESIDENT and NON-RESIDENT CANDIDATES. N.B.—Ten were sent up, Eight passed.

KENSINGTON. Six Resident and a few Non-Resident PUPILS are received at 28 Addison Gardens South, by Mr. FREDERIC NASH, formerly Head-Master of the Kensington Collegiate School. Terms on application.

COMFORTABLE HOME, with PRIVATE TUITION.

The RECTOR (Married) of a small County Parish, an old Englishman and Graduate of Trin. Coll., Cambridge, who takes FIVE PUPILS, has Vacancies. Classics, Mathematics, French, and thorough German; and peculiar advantages for young men fond of country life and pursuits. Terms, inclusive, 150 to 200 Guineas.—Address, Rev. H. L. L., Holigate Rectory, Much Wenlock, Salop.

PRIVATE TUITION.—A late Government EXAMINER,

Cambridge Graduate in Mathematical Honours, Scholar, Double Exhibitioner, and Triple First in Mathematics, Classics, and History, assisted by eminent Professors, prepares PUPILS for the Universities and every description of Competitive Examination. Reference to successful Pupils.—Address, DELIA, 97 Westbourne Grove, Daywater.

A MARRIED RECTOR, residing at a charming Country

Rectory, would receive a YOUNG MAN who needs advice and assistance towards breaking of Evil Habits. Advertiser has had great success in cases of intemperance.—Address, in confidence, Rev. T. B. Post-Office, Great Missenden, Bucks.

GERMAN INSTITUTE for YOUNG LADIES at DIEZ, on

the Lahn, near Wiesbaden, Prussia. The highest references given in England and Germany.—For Prospectus apply to the Director, P. LAMKE.

THE LONDON CIVIL SERVICE and MILITARY

COLLEGE.—Thorough preparation for the Army, Cooper's Hill, Civil Service, &c. Next Term commences September 1.—For Prospectus apply, during August and September, at the Studio, 26 South Row.

STOKE HOUSE, near SLOUGH.—The Rev. E. ST. JOHN

PARRY (late of Exeter House, Durham Down, Bristol) has REMOVED to STOKE HOUSE, near Slough. Mr. PARRY inspects for the Public Schools generally, and also specially for the Scholarship Examinations at Eton, Winchester, and other Schools, as hitherto. MR. HARMAN TELLER will commence September 25.—For further particulars apply to Mr. PARRY, Stoke House, Slough.

A YOUNG PARISIAN GENTLEMAN (diplômé) désire

ENSEIGNER dans une bonne Famille supérieure à FRANÇAIS, le LATIN, le CHANT, &c.—Address, V.B. Vestry, French Protestant Church, Monmouth Road, Daywater.

A GRADUATE OF OXFORD or CAMBRIDGE is required

to be the CARETAKER PROPRIETARY SCHOOL COMPANY, Limited, to take Charge of a Temporary School, from the commencement of the Autumn Term until the Erection of large permanent Buildings. Salary £200 per annum, with Unfurnished House and liberty to take Boarders. Applications with Testimonials to be sent to JOHN MORGAN, Esq., Secretary, 45 Park, Tredgareville, Cardiff, from whom all information may be obtained.

A LECTURER in GEOLOGY and MINERALOGY WANTED

in a Private Establishment in London. Only University Graduates, in high honours, need apply.—Address, X. & Regency Square, Brighton.

ELECTORS, PARLIAMENTARY and MUNICIPAL, and

respectfully requested to consider whether any CANDIDATE deserves their support who upholds the present monopoly by means of Poor Rates in Parish Churches of our Public Pastoral Offices, erected and set apart by law for the two Worship of all, rich and poor alike, Residents of a City, Town, and Information for Freeing a Church sent gratis by the NATIONAL ASSOCIATION, Central Office, Manchester.

E. HERFORD, Chairman.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill.

Physician.—Dr. EDWARD LANE, M.A., M.D., Edin. Turkish Baths. Consultations daily (Saturday excepted) at 7 Prince's Street, Hanover Square, from Ten till Twelve.

HYDROPATHY, MALVERN.—Dr. RAYNER'S ESTAB-

LISHMENT (formerly Dr. Wilson & Taylor). For prospectus apply to T. RAYNER, M.D., Malvern.

BRIGHTON.—BEDFORD HOTEL.—Every endeavour is

made to render this Hotel equal to its long-existing repute. Spacious Coffee Room for Ladies and Gentlemen. Sea-Water Service in the Hotel.—Communications to The MANAGER, Bedford Hotel Company, Limited.

HEALTH RESORTS.—ILFRACOMBE HOTEL.

Beautiful scenery of North Devon. 210 Apartments. Wines choice. Table d'hôte daily. Cuisine excellent.

THE GRANVILLE HOTEL, St. Lawrence-on-Sea.

Hamagat the nearest Station on both Lines. One of the most elegant, commodious, and comfortable Hotels in the Kingdom. Hydropathic, Turkish, Ozene, Salline, Plunge, and other Baths in the Hotel. Table d'hôte daily.

THE IMPERIAL HOTEL, Great Malvern.—Visitors are

received as Boarders, or by Tourist. The Hotel is beautifully situated, being surrounded by charming scenery. Excellent Stable accommodation. Table d'hôte at 6.30 daily. Turf will be forwarded on application. The Hotel is connected with the Railway Platform by a covered way.

DRAWINGS and SKETCHES from NATURE, by the late

G. WALLWYN SHEPHERD.—Autotype PRINTS taken from the above, suitable for Framing, or for Studies in the treatment of Forest Trees, Foliage, and Landscape subjects. Detailed List of Sizes and Prices on application.

Collections of PHOTOGRAPHS Complete, Coloured, Titled, and properly Bound.

MARION & CO., 23 and 27 Soho Square.

J. GERSON'S FINE ART GALLERY, and Depot of the

BEILIN PHOTOGRAPHIC CO., 5 Rathbone Place, W., and 71 London Wall, E.C., offers the last PROTECTED PHOTOGRAPHY direct from Paintings, both ancient and modern. For inspection at the West-End Depot, 5 Rathbone Place, attention is directed to an important series from Paintings in the world-renowned Dresden Gallery, just published. The famous Madonna di San Pietro, by Raphael. The Photographs are warranted permanent. Catalogues free. Shoppers and the Trade supplied.

CRÈME de la CRÈME (the New Court Note Paper),

made from Choice Perfumers. Registered.—The Public are respectfully CAUTIONED that the NEW COURT NOTE PAPER is to be had only of JEREMY & KNOWLES, to the Queen, Heraldic Engravers and Stationers by Special Appointment to their Royal Highnesses the Prince and Princess of Wales. Specimens of Monograms, Stampings, and Chant Parfums free. 31 St. James's Street, and 40 Jermyn Street, S.W.

RODRIGUES' MONOGRAMS, ARMS, CRESTS, and

ADDRESSES Designed, and Steel Dies Engraved as Copy.

RAIFORD, RUBIC, GROSSE, and RODRIGUES' MONOGRAMS are especially designed for any combination of Letters. MONOGRAMS and ARMS are designed in Colour. Relief, and brilliantly illuminated in Gold Silver, and Colours, in the highest Style of Art.

VISITING CARD-PLATE elegantly engraved, and 100 Superior Cards printed for 6s. 6d.

At HENRY RODRIGUES, 45 PICCADILLY, LONDON.

E. DENE & CO., 61 Strand, and 34 Royal Exchange, Manchester.

VACATION POLITICS.

THE postponement of Cabinet changes and Ministerial announcements for the supposed convenience of Mr. BRIGHT has given the Birmingham League an excuse for suspending the hostile operations which have been equally injurious to the assailants and to the regular Liberal party. It was perhaps in the hope of facilitating a desirable armistice that some zealous member of a Yorkshire deputation imagined and published a surprising speech which purported to have been delivered by Lord FREDERICK CAVENDISH. The Private Secretary of the PRIME MINISTER, immediately after his promotion to a higher and equally confidential post, was reported to have retracted by authority Mr. GLADSTONE's powerful speech on Mr. MIALLE's motion, and to have assured the partisans of the League that he himself, and by implication his chief, was nearer to them in opinion than they had believed. As might have been expected, Lord FREDERICK CAVENDISH has lost no time in disavowing a statement which would have been indiscreet on his own part and dishonourable to Mr. GLADSTONE. It seems that the new Lord of the Treasury neither had nor professed to have any authority to express the opinions of the PRIME MINISTER, and that his own declarations had been grossly misrepresented. The newly-elected member may be excused for the courteous assumption that the errors in the report were unintentional. It was at least opportune for the purposes of the League to be able to quote a recantation of Mr. GLADSTONE's forcible and decided language. Their leaders have now announced their intention of supporting the Ministerial candidate at any election which may occur before the publication of Mr. BRIGHT's expected address to his constituents. Up to the present time their efforts have only resulted in a considerable increase of the numbers of the Conservative party in the House of Commons. In some places they have started candidates for the express purpose of dividing the Liberal forces; and elsewhere they have by a threat of opposition extorted from the nominee of the party an adhesion to their doctrines. Captain HAYTER at Bath, and Mr. DANDY SEYMOUR at Shaftesbury, thought it prudent to pledge themselves to the sectarian formula; but they might as well have thrown upon the Nonconformist agitators the undivided responsibility of defeat. It had probably not occurred to the League that their opponents also may entertain conscientious convictions. A vote earned by a pledge in favour of secular education is no gain to a candidate who by his denunciation of the 25th Clause of the Education Act assumes a moderate supporter. The League has committed the error of shooting its only arrow too soon. A threat of secession is formidable to a Minister; but when a mutinous faction has done its worst, he has no longer the same motive for conciliation.

The Conservative victory at Shaftesbury would have been one of a monotonous series but for the curious illustration which the contest afforded of the influence which still belongs to rank and property. The borough of Shaftesbury has for many years returned a Liberal member who shared the opinions of the principal proprietor in the neighbourhood. Since the last election the estates have devolved on two ladies of the family who have adopted Conservative doctrines. Although by constitutional custom a peer is prevented from interfering directly in elections, no similar restriction is imposed on ladies of rank. The Marchioness of Waterbury, in a published letter rebuked Mr. SEYMOUR for his political position that she had taken no part in the contest. On the contrary, it appeared that her sense of duty to the country and to the Queen impelled

her strenuously to support the Conservative cause; and she even hinted that the Controller of the Household had violated one of the precepts of the Decalogue by voting in favour of the party with which he is officially connected. It is perhaps not wonderful that Mr. DISRAELI should advocate the rights of women when he profits so conspicuously by the amiable logic and divinity of the sex. It seems certain that the zealous support of the owners of Motcombe had much effect in securing the return of the Conservative candidate. Since the establishment of the system of secret voting, it is useless to protest against a pressure which can only consist in persuasion. If the householders of Shaftesbury, or of any other borough, wish to gratify a wealthy and popular neighbour, they have a legal right to vote as they please. The cheers with which the patronesses of the Conservative cause were greeted whenever they appeared in public would have proved, independently of the ballot-box, that the preference for their principles, or for themselves, was perfectly sincere. The daily organ of the Conservative party absurdly described Mr. BENNET-STANFORD as "the poor man's candidate." A poor man's candidate is in general but a questionable personage; and in this instance it would have been more accurate, and not less complimentary, to reverse the phrase by anticipating the triumph of "the rich woman's candidate." It is impossible to accept the ultra-Liberal explanation of the recent elections. Brewers and distillers and dowager peeresses could not have given the victory to the Conservative party if Liberalism of the Birmingham type had found favour with the constituencies. If some defections may be attributed to the alleged lukewarmness of the Government, a far more general and more significant reaction is caused by a suspicion that the Ministers may encourage some new attack on existing institutions.

If it were worth while to advise election managers on their own special business, a doubt might be intimated whether the Conservative agents are prudent in their present display of restless activity. The local conditions of success are not everywhere as favourable as in a borough where a gentleman of mature age breaks the Fifth Commandment if he votes against the wishes of his mother. Nottingham is a larger and more heretical place than Shaftesbury, and it may be unsafe to rely on an invocation of the memory of Sir ROBERT CLIFTON, whom the Conservatives revere as the tutelary genius or patron saint of the borough. Two or three years ago a candidate who boasted that he had been the confidential friend of the departed worthy was defeated by an enthusiastic Republican; and although Mr. AUBERON HERBERT is about to transfer his energies to another sphere of action, it will not be difficult to select another candidate of the same opinions. Unfortunately the Conservatives have borrowed from their adversaries the practice and title of demonstrations or exhibitions of the numerical strength of a faction. At a late meeting there seems to have been as characteristic an absence of reasoning as if the assemblage had consisted of Trade Unionists instead of devotees of the Constitution. One of the Conservative candidates is described in familiar phrase as a local employer of labour. The name of Mr. DENISON of Uxington, nephew and heir of the late *White Speaker*, may suggest some anxious thoughts to politicians who are neither worshippers of the late Sir ROBERT CLIFTON nor enthusiastic partisans of Mr. DISRAELI. As there is no commandment which prescribes the duties of nephews, to uncles, a deviation from the traditional politics of a family can scarcely be considered reprehensible; yet it is a cause for grave regret that for some years past all the aristocratic conversions have tended in the same

direction. It is intelligible that the owners of property should regard with distaste a party which nominally includes the disciples of Mr. MILL, and even the followers of Mr. BRADLAUGH; but nothing could be more disastrous than a horizontal stratification of parties, according to rank and position, in place of the ancient divisions of feeling and opinion. It was by directing progress, and not by indiscriminate resistance, that the predecessors of the present owners of property averted anarchy and revolution.

The rumour of Ministerial changes has lately become fainter, though it may perhaps be revived when Mr. BRIGHT's mysterious silence is broken. Probable reports are always to be distrusted, because external evidence of fitness or expediency sufficiently explains their origin. Paradoxes which occur constantly in real life become incredible when they are not verified by experience. From the proposition that Mr. AYRTON is misplaced in a sinecure post, and Mr. MONSELL in an office of important business, careless reasoners easily pass to the inference that the Postmaster-Generalship is about to be vacated, and to be filled by the present Judge-Advocate. Mr. LOWE is extremely likely to give offence to various persons as Home Secretary; but it by no means follows that he is about to be transferred to the India Office. The Government would gain by the transformation of Mr. BOUVIER from a troublesome critic into a useful colleague; and, sooner or later, Mr. HARBOUR's not dissimilar claims will be recognized by an offer of place; but there is no reason to believe that Mr. GLADSTONE meditates for the moment any considerable changes. According to a recent rumour, the ATTORNEY-GENERAL was about to be raised to the Bench and to a peerage, and the Law Offices were to be occupied by Mr. HENRY JAMES and Mr. WATKIN WILLIAMS. It happens that there is at present no judicial vacancy; and, although one of the Barons of the Exchequer is likely to retire, Sir JOHN COLERIDGE could scarcely accept a puisne judgeship; nor would the peerage be, according to precedent, a suitable appendage to such an appointment. It would be far more convenient, in anticipation of the changes to be effected under the Judicature Bill, to place an Equity lawyer on the Common Law Bench; and the LORD CHANCELLOR would probably make the appointment without reference to political considerations. The most important and most interesting of public rumours consists in the negative statement that the dissolution of Parliament will be postponed until next year. The Government has no motive, in the present temper of the constituencies, for trying a leap in the dark. Although no sagacity can forecast the result of a general election, it is nearly certain that the Liberal majority will be largely diminished, and especially that the new Irish members will be unmanageable. It is possible that some of the Ministers themselves might lose their seats, nor would such arrangements as that by which Mr. BRUCE was returned for Renfrewshire be at present practicable. The postponement of an appeal to the constituencies is a definite, though temporary, advantage to all parties.

FOREIGN POLICY OF THE FUSION.

THE Republican party in France have discovered a new reason why the nation should reject HENRY V. His accession to the throne, they say, would mean a war with Italy and Germany, a new indemnity, and the loss of Nice and Savoy. This gloomy picture is only a logical deduction from the premisses supplied by the clerical party throughout Europe. Everywhere the Ultramontanes are ardent Legitimists, and as they are ardent in no cause which is not directly or indirectly that of the POPE, it is safe to assume that they expect a restoration in France to be followed by a restoration at Rome. The language used by the Count of CHAMBORD on various occasions since 1848 goes far to justify the expectations founded on it. In HENRY V. the Church would, to all appearance, have a more dutiful eldest son than in any of the Kings to whom that title has by courtesy been given. He has learned to identify piety and loyalty, the reverence due to the Vicar of CHRIS with the reverence due to the LORD'S Anointed, in a way that must rejoice the POPE's heart. He is perhaps the only man in Europe in whom the two beliefs are honestly united. There are many Legitimists who think the Ultramontanes useful allies, and many Ultramontanes who hope to find the Legitimists useful tools; but the Count of CHAMBORD genuinely believes that the two ideas are indissolubly interwoven. If the POPE were

a younger man, he would probably admit, at all events to himself, that under some conceivable contingencies the Church might become democratic. But the Count of CHAMBORD would not allow that the throne could ever rest with safety on any arm but that of the Church. The revolution which made him a Pretender instead of a King was the same movement, he would say, as that which converted PIUS IX. into something little better than a spiritual prince; and before its progress can be entirely stayed, even in France, the POPE must again become an Italian Sovereign. It is only reasonable, therefore, that the clerical party should be besieging Heaven with prayers for the triumph of the Fusion. It is the best card they have had in their hand for many rounds, and they are naturally eager for an opportunity to play it.

Whether it will make much difference to the game if it is played is another question. The Ultramontanes probably argue that in Continental countries monarchs have still very considerable influence in politics, and most of all in foreign politics. Consequently to have a King on the throne of France whose main desire is to give the POPE his lost provinces, will be to have a most influential friend in the Ministerial Councils. It is possible that for some time to come he may not have the power to do much for the cause; but as his throne becomes firmer, his power will increase, and meanwhile France, under the guidance of the Church, will be learning to identify vengeance on Italy with vengeance upon Germany, and to see in a war that shall snatch the Romagna from Piedmont only another aspect of the war that shall snatch Alsace and Lorraine from Germany. It is possible that if the quarrel with Italy were one that could be taken up whenever the French Government liked, some part of those anticipations might prove true. But in all probability it will be a quarrel which the new King of France must decide either to take up or to leave alone immediately upon his accession. The Italian Government will have at once to determine on what terms they are to stand towards the restored Monarchy, and in considering this point, they will naturally inquire on what terms the restored Monarchy proposes to stand towards Italy. Thereupon, the King of France will have to answer either that the King of ITALY is his very good friend and brother, with whom he wishes to maintain a cordial friendship and alliance, or that he feels it his duty to point out to him how grievously he has erred in taking possession of the POPE's dominions. The mere statement of the alternative seems to us enough to discredit it. The most despotic Sovereign cannot altogether disregard the advice of his Ministers or the wishes of his subjects. He cannot make war in defiance of both. NAPOLEON III. went as far in this direction as it was possible to go, but then he had a technical provocation, and his people had been trained to regard a war with Germany as inevitable. In the case supposed HENRY V. would have no provocation to allege. Italy would have done nothing new, nothing which former French Governments had not condoned, nothing which threatened even remotely any genuine French interest. Frenchmen have no desire to fight the Italians; nay, they know that they could not fight them without imperilling their chance of being able within any reasonable time to fight the Germans. Whatever other illusions the war may have left to the French nation, they seem to have none at all as to their military position. They are resolutely bent upon regaining their strength, and upon using it when regained in reconquering their lost territory. But they are under no mistakes as to the greatness of the task that lies before them. They know how long it will take to raise and discipline an army equal to their needs; and even if there were no question of Germany siding with Italy, they would have no wish to waste in premature and purposeless hostilities the strength which prudence bids them husband with the utmost care. There can be no doubt, however, that Germany would not sit still while France was measuring herself against Italy. There is a strong party among German politicians who think that France was let off too easily, and who regret that the punishment inflicted was not heavy enough to crush her altogether. If France were now to go to war in a cause in which Germany has a collateral interest—and since the adoption of her present policy towards the Roman Church Germany is collaterally interested in everything that concerns the POPE—this party would be greatly strengthened. They would be able to point to the quarrel with Italy in proof that the

French character had undergone no change, and that the peace of Europe demanded that her new teeth should be drawn by the same hands that had extracted the old ones. Even the Count of CHAMBORD, unless he believes that a miracle is to be worked in his favour, would not rush upon such certain destruction as would be involved in an unprovoked war with Germany; and as neither his Ministers nor his subjects would share that belief, supposing him to entertain it, he would have some difficulty in declaring war, and more in carrying it on. A restoration would entail many evils upon France, but we do not believe that the adoption of an absolutely suicidal policy would be one of them. The sympathy of HENRY V. with the POPE might be expressed by an autograph letter, but the burden of its contents would probably be that the powers of evil were too strong to be openly attacked. It is pleasant of course to hear your enemies called names, but when that excitement had passed away, the POPE would find that the powers of evil meant no more than the old logic of facts.

Although, however, the fears expressed by the Republican party would probably turn out to be greatly exaggerated, it is quite possible that the apprehension of difficulties in foreign policy may have some share in the coolness which seems to be growing up between the Duke of BROGLIE and the Fusionists. The Duke must be perfectly aware that for the Conservative party to waste its strength in effecting a restoration, and then to be obliged to withdraw from the councils of the Sovereign rather than identify itself with his reactionary extravagance, would be a highly unsatisfactory ending to the coalition which it took so much labour to get afloat. The chances may be unfavourable to such a catastrophe, but the Count of CHAMBORD is chiefly known for his persistence in ideas which he has once expressed, and he is very much in the hands of a party which would willingly let France perish if the sacrifice could do any service to the temporal power of the POPE. It would not be surprising, therefore, if the Duke of BROGLIE liked the Fusion less the longer he looked at it; and in that case it would be an obvious stroke of policy to anticipate any proposal of the Monarchists by bringing in a Bill to continue Marshal MACMAHON's powers for a definite time. This would in effect be a prolongation of the present provisional state of things, and as such would naturally carry with it a corresponding prolongation of the life of the present Assembly. In one of those aspects it would formerly have been displeasing to the Monarchical party, in the other to the Republican. But it is by no means clear that under present circumstances the moderate sections of both parties might not agree in supporting it. A Provisional Government with Marshal MACMAHON at its head conveys a great sense of security to Monarchists who regard a King chiefly in the light of a policeman. The Conservatism of the present Cabinet they will admit to be beyond impeachment, and where the essentials of good government are secured, it may be the safer plan not to strive after formal perfection. On the other hand, the prolongation of Marshal MACMAHON's powers would be in form the continuance of the Republic, and in so far as it was so, it would be a tribute to the Republican tendencies of the nation. The prospects of the Republican party are not so brilliant that it can afford to despise even this moderate degree of recognition. It is better to have the present Assembly, with the Provisional Government secured for a certain number of years, with the chance of the composition of the Chamber steadily becoming more Republican under the influence of partial elections, than to have the present Assembly with the Monarchy set up again, and the whole influence of the Government and of the Conservative party in the country employed to strengthen the restored throne. A party which can bring forward such practical reasons as this may fairly be acquitted of inconsistency in adapting its policy to the changed conditions of the country since the fall of M. THIESS and the reconciliation of the two branches of the House of BOURBON.

MR. LOWE AT SHEFFIELD

THE praises of Mr. Gladstone's Government have been sung so often that it would be some ingenuity to say anything new upon the subject. In his speech at the Outcry, however, Mr. Lowe succeeded in giving real freshness to the measure which the Government have carried through Parliament. In 1869 we passed the Irish

Church Bill, in 1870 the Irish Land Bill, and so on. Mr. Lowe is more alive to the advantages of judicious grouping. He produces a novel effect by representing the Cabinet taking counsel five years ago how they should make their tenure of office memorable in the history of England. In the execution of so great a design system is everything, and before putting their hands to the plough the Cabinet surveyed the field and determined the line the farmers should take. "They came," says Mr. Lowe, "to resolutions the most extravagant that any set of middle-aged and elderly gentlemen ever arrived at." These resolutions involved nothing less than the solution of "all the leading difficulties then seen in the political horizon." They looked at Ireland, and they resolved, by giving her the strictest and fullest justice, to take away from her all grounds of complaint. They looked at the new voters, and they resolved that the ignorant among them should be educated, and that those who were poor should have the protection of the Ballot. They said that in future there should be no panics, and, with that view, they determined so to modify the structure of the army as to weld regular and auxiliary forces into one compact mass for the purpose of resisting invasion. They made up their minds to put an end to the waste of power in the judicial body arising from antiquated rules and unnecessary subdivisions, to make the Civil Service a reward for poor and deserving students, and to take vigorous and searching economy as the rule of their financial administration.

It is a programme of which the Ministry may well be proud, and Mr. Lowe has a right to say that, with the single exception of the higher education of Ireland, it has been more or less realized. Indeed, in a sense it may be said to have been realized even upon this point, for the Government were willing to take away all ground of complaint, and, as the division on the second reading showed, it was only the shortsightedness of the Irish members that prevented them from carrying out their purpose. How then is it, asks Mr. Lowe, that though the Ministry have done all that they proposed to do, they have not had their labours adequately acknowledged? The HOME SECRETARY does not treat the part of his subject with the same breadth and fulness that he bestowed upon the other part. What his answer comes to is, that some people are fatigued by rapidity—that after so much progress they wish for an interval in which to "take breath before they are whirled on to further exigencies." This is clearly an inadequate explanation of the present unpopularity of the Government. Mere fatigue would not lead Liberal constituencies to send Conservatives to Parliament. They would rather content themselves with sending extremely moderate Liberals. Just now, too, a section of its supporters are finding fault with the Government for being a slow coach, for seeing no more exigencies to be met, no more horizons to be cleared of difficulties. Why, on Mr. Lowe's hypothesis, do not the tired-out Liberals join in helping the Government to resist these over-active adherents? Again, the great rush of Ministerial activity was naturally shewn in the early part of the programme. We do not know that anybody's breath has been taken away by the rate of progress of the Purchase Bill or the Judicature Bill. When the history of the fall of the first GLADSTONE Administration comes to be written, Mr. Lowe's hypothesis will hardly be thought to account for the facts.

Perhaps the very completeness with which the programme has been carried out is to some persons a reason for dismissing the Ministers to whom its execution is due. When a Government takes office with the object of getting rid of the leading difficulties which beset the path of politicians, a notion is apt to get abroad that they are men called in to do a special task, and that when the task is finished, it is as well that their engagement should come to an end with it. It is not so much that the country wants to see its affairs administered by new men as that it wants a little time to consider whether the men who have got through this special and exceptional work are necessarily the best men to be employed in ordinary work. On the one side there is a section of Liberals insisting that since the Government took office a new set of clouds have gathered on the horizon, and that if Ministers are to remain in power, they must again go into council, and come out with a programme as extensive as that with which they started in 1868. On the other side there are the Conservatives saying in effect, You cannot always be displacing Churches, turning tenants into landlords, remodelling the army, or constructing new Courts of Appeal. Granting that all these measures were just and

necessary, a nation has something else to do than to pull its house about its ears. It has to live in the house after it has been altered, and we can show you what very inefficient servants the Ministry have shown themselves for quiet times. You had much better give us a turn. We shall not dream of undoing anything that has been done. You will keep all that the Liberal Government has given you, and you will get what the Liberal Government has shown itself unable to give you—sound, steady, working common sense. We do not promise you sensational legislation, but we do promise you that all the little affairs that have been neglected while nothing was thought of but “the programme” shall all be looked to and put in order. Between these two rival voices constitutions are a little puzzled. They do not quite like the notion of another programme; at least they want a little time to think about it. And they are not quite sure whether, if the Government remains in power, it may not be tempted to take the bread out of the mouth of the extreme Liberals and send its telescope round the horizon once more. Accordingly they comfort themselves with the reflection that, as Mr. Lowe himself declares, the Cabinet have done all that they set themselves to do, so that nothing will be lost by sending them about their business. And if on experiment it turns out that the Conservatives cannot administer, or if a new crop of difficulties should unexpectedly disclose themselves, why no great harm will have been done. The Liberal Ministers will be no further off than the other side of the House of Commons, and nothing will be easier than to call them back to their old places.

Mr. Lowe says nothing about the difficulties in which he found himself before he left the Exchequer. Probably when he came to think them over, he felt that even after dinner the Zanzibar Contract and Mr. SCUDAMORE'S expenditure were best left alone. But he does enter into a detailed and, in some respects, successful vindication of his general administration. When he succeeded to office, it seems, he took stock of himself, and came to the conclusion that, though he had no special genius for finance, he knew the value of economy, and that, if he could not lessen the burdens of the nation by brilliant experiments in taxation, he could do something in the same direction by seeing that none of the revenue was spent in extravagance. Before Mr. Lowe's time the Chancellor of the Exchequer did not concern himself with the question of expenditure. If the head of a department wanted leave to lay out more money, he went to the Secretary of the Treasury. Mr. Lowe began his career by issuing an order that no new expenditure should be allowed without his opinion being first taken upon it. No doubt this rule worked beneficially as regards economy. Mr. Lowe's enumeration of the taxes he has been able to take off, and of the sums he has been able to pay towards the reduction of the National Debt, is sufficient evidence on this point. But it may not have worked equally well as regards administration. In private life there is such a process as “greasing the wheels,” and it is usually found that, if no money is spent in this way, things more important than economy are apt to suffer. In public life there is probably fully as much need for this kind of outlay. The head of a department may not always be the best judge of the amount that ought to be spent on it, but he may often see that a little more liberality would make his staff contented instead of discontented, and would secure that zeal and activity the absence of which is sometimes the real cause of an administrative breakdown. No general rule can be laid down in matters of this kind. All that the Treasury can do is to go into each question on its merits, and do its best to come to a fair decision. But while it would be most mischievous for the Treasury to get the reputation of always yielding to requests of this kind, there is some danger in its getting the reputation of always resisting them. When this is the case, heads of departments become unwilling to expose themselves to implied rebuke, and refrain from suggesting additional expenditure even when it would bring in large interest in the shape of increased efficiency. Yet perhaps that increased efficiency might have saved the Government from one of those small losses of administrative reputation which in the aggregate do it as much harm as great legislative failures. When a Chancellor of the Exchequer takes office with the resolution to go into every question for himself, the mere announcement is enough to frighten a Minister who wishes to suggest that his department would be better worked if it could lay hold on a little more money. No one likes to be swept clean by a new broom, and a

Chancellor of the Exchequer who supersedes the Secretary of the Treasury because he is not strong enough to resist Ministerial pressure, is a very new broom indeed. Mr. Lowe's share in the Liberal programme goes some way to explain why the programme as a whole has been received with so little gratitude.

SPAIN.

THE rebellion of Carthagena creates an important diversion in favour of the Carlists; nor is it certain that the insurgents will be defeated in the conflict which they have provoked. The possession by a local body of insurgents of supremacy at sea is an entirely novel incident in civil warfare. The unfortunate Admiral who serves the central Government is constantly compelled to retreat to Gibraltar after harmless menaces against the rebel forts and shipping. The English naval commander still retains possession of the two ironclad ships which were so hastily seized by Commodore WERNER, and has carried them off for safety to Gibraltar, where they are to remain until it has been determined what shall be done with them. At one moment it appeared not improbable that the English squadron would find itself engaged in actual hostilities with the insurgents, who threatened to open fire on it if any attempt was made to remove the captured vessels. The squadron cleared for action, but happily the menace of the rebels was not fulfilled, and the bombardment of Carthagena was thus avoided. It has been the plain duty of Admiral YELVERTON to discharge the functions of an impartial stakeholder as long as he receives no definite instructions; but if the struggle lasts, the English Government will be compelled to form some positive or negative decision. The most judicious course would probably be to wait, like the citizens of Angers in the play of *King John*, until the victory of one of the combatants establishes his title to the disputed property. The restoration of the ships to insurgents whose treason may perhaps soon be demonstrated by defeat would give reasonable offence to the Government of Madrid. On the other hand, it is not the business of an English naval force to recapture for the central authorities armaments which they had not the power or the foresight to secure. It may even be doubted whether Admiral Lobo is really anxious to strengthen his squadron by a reinforcement which would make a sea fight unavoidable without rendering victory certain. In the meantime the insurgent vessels cruise with impunity along the coast, in the hope either of extorting contributions from maritime towns, or of compelling the little army of the besiegers to divide its force. Some of those odd enthusiasts who contrive on all occasions to work themselves into a state of virtuous or patriotic excitement express a wish that, by an attack on Lisbon, the *Numancia* would give the English ship *Devastation* an opportunity of proving her superior efficiency. Nothing can be more improbable than that the insurgent Government of Carthagena should wantonly provide its enemies with the benefit of an irresistible alliance. The cruise of the *Numancia* may perhaps have been principally designed to prove that in their own neighbourhood the insurgents have the command of the sea. At present it would seem that they are able at their pleasure to threaten and insult every port in Spain.

It would be an unmixed misfortune for England to be dragged into a confused and unprofitable quarrel; and it is even undesirable to express publicly any preference of one party to another. Whether Carlists, Central Republicans, theoretical or practical Federalists prevail, the principles of the dominant party would deserve little sympathy, although the fact of success must be necessarily recognized. It is too often forgotten that the wealth, the intelligence, and the respectability of the nation remain perfectly aloof from the miserable Republic and its subdivisions. At present there is no reason to believe that the Carlist Pretender will be accepted by the population, although the follies and misfortunes of his actual opponents have rendered his prospects less unfavourable than in the days of constitutional monarchy. Every statesman who has before the last few months at any time held power in Spain is in retirement or exile; and General PAVIA is the only military chief of reputation who serves the Republican Government. SERRANO, OLIVERA, SAGASTA, and ZORRILLA may perhaps be as strongly opposed to CASTELLAR and to SALMERON as to CONTRERAS and ROQUE BARCIA. It is at least certain that they owe nothing to the moderation or the

regard for law of the former Republican Opposition. Only two or three years ago the chiefs of the Republican faction had not avowed their intention of splitting up Spain into a cluster of petty provinces; yet CASTELAR is by profession a Federalist, though he now delivers fine phrases about the necessity of founding the Federal Republic on a constitution rather than a pact. Any intervention of a foreign State in favour of Madrid against Carthage would probably irritate and disappoint the next Government which may succeed to power. The Carlists themselves, if they should unexpectedly establish their system on the ruins of the Republic, would have just ground of complaint against any Power which might have delayed their success. Among all the jarring factions the Republicans who now nominally exercise power are perhaps the least likely to emerge from the revolution as the dominant party. It must be admitted to their credit that the Ministers are on the point of proroguing the Cortes, in the conviction that an Assembly elected by a Republican constituency will offer fatal impediments to the overthrow of the insurgents.

The reported understanding between the Carlists and Socialists in the North of Spain may be considered, if it has really been established, nearly the most paradoxical event in a strange series of surprising anomalies. Common enmities are undoubtedly motives of union; but it might have been thought that reciprocal antagonism of traditions, of opinions, and of objects would prevent an unnatural coalition even among Spanish rebels. The Socialists propose to abolish religion and property; and they have taken arms against the Government of Madrid only because it still represents the shattered remnant of political and social order. The cause of the Carlists, on the other hand, since their success has raised them above the rank of freebooters and adventurers, contains some respectable elements. They risk their lives for the sake of a King who inspires by his title, if not by his personal qualities, an old-fashioned loyalty; and they are attached to a Church which inculcates, in addition to more doubtful doctrines, the general principles of religion and morality. It may be assumed that the co-operation of the two factions is founded entirely on military expediency. The Carlists are releasing Socialist prisoners from their places of confinement in the same spirit in which the Dutch have sometimes defended their country by opening the dykes to admit the waters of the sea. An inundation is not in itself an advantage, but in some circumstances it may be preferred to an invasion. It is nevertheless strange that the priest-ridden partisans of the absolute King should persuade themselves to tolerate outrageous heresies. They constantly denounce the Republic, not without pretext, as a godless system of anarchy, and yet they enrol in their own bands insurgents who regard the Madrid Ministry and Cortes as champions of obsolete Conservatism. Whatever may be the explanation of the story, Don CARLOS has, like his French prototype and kinsman, the merit of consistent adherence to the theories which he has always professed. When his throne is established no elected Assembly is to share in the government, nor is any form of dissent from the established religion to be openly tolerated. It is perhaps not surprising that the rapid degeneracy of Spain since the fall of ISABELLA should incline hasty reasoners to condemn the whole system of constitutional government; yet if the followers of Don CARLOS were acquainted with history, they would know that legitimate monarchy had at the close of the last century reduced a loyal and orthodox nation to utter decrepitude.

The wavering attitude of the ultra-Republicans in Barcelona may probably be explained by their anxiety to retain a protective tariff for their manufactures. The International Society, which exercises much local influence, was primarily established for the purpose of maintaining a high rate of wages, and ultimately of transferring the profits of industry from capitalists to workmen. The division of Spain into little independent States would not tend to secure the monopoly of native manufacturers in any part of the Peninsula. Barcelona can scarcely expect to have a voice in the establishment of a Customs tariff for Carthage or Cadiz, unless all Spanish production and consumption is under the control of a common Government. The Andalusians are likely to demand cheap foreign fabrics in exchange for their wines, instead of paying a tribute to the workmen of Catalonia, whom they perhaps equally regard as aliens. It is surprising that the Government of Madrid should be able to provide itself even with a scanty

revenue. The insurgents are restrained by no scruples as to the rights of property, and during the siege of Carthage they may be willing to submit to hardship and deprivation. Their provisions are collected by requisition, and they are largely supplied with materials of war which were purchased at the national expense. Their enemies have a larger territory and a show of legal right; but they have to depend on the collection of taxes, or on loans raised after their credit has long been exhausted; and they are compelled to provide for the necessities of the Carlist struggle as well as for the siege of Carthage. If either party can find a capable commander, military skill and energy will probably decide the contest. It would seem that CONTRERAS is an empty pretender, and rather a demagogue than a general; and General PAVIA, who will probably assume the command of the besieging force, has at least the merit of doing his utmost to enforce military discipline. The Ministers and orators at Madrid are beginning to learn that capital punishment is the only remedy for mutiny; and the present Cabinet has not repeated the declaration of one of the preceding Ministers, that force ought not to be used against Republicans, even if they chanced to be rebels. Nevertheless the Cortes still tolerate the presence of insurgent leaders in their midst, on the absurd pretext that members of the Assembly are inviolable, although they may have been guilty of open treason. Perhaps anarchy must proceed still further before it reaches its inevitable termination in a military dictatorship or despotism exercised by some vigorous leader.

THE ASHANTEE WAR.

WHATEVER may have been the causes of the Ashantee war, the Government has adopted the most judicious course in preparing for a vigorous prosecution of the contest. It is certain that the invaders will listen to no argument but force, and the details of the process of conviction can only be settled on the spot by competent military judgment. The appointment of Sir GARNET WOLSELEY has caused general satisfaction, and it may be assumed that no expense will be spared in providing him with the materials of success. The English expedition to Magdala and the Russian conquest of Khiva furnish recent precedents of the most effective mode of conducting operations against barbarous enemies in dangerous climates. If the troops are efficiently protected against hardship and disease, their great superiority in discipline and in armament ought on all occasions to ensure victory in the field. The Ashantees indeed are more warlike and more formidable than the forces either of Abyssinia or of Khiva; but, notwithstanding their undoubted courage, their army has been easily defeated by a handful of marines. Their subsequent persistence shows that they misunderstand the resources and the determination of the enemy whom they have provoked. Although they have not ventured to attack Cape Coast Castle, they occupy the neighbouring country, with the apparent purpose of settling permanently on the coast. The protected Fantee tribes, although their name indicates their family relation to the invaders, seem for the present to be incapable of offering resistance. It will be the business of the officer who has been appointed under the title of Commissioner to arm and organize, if possible, a native force which may relieve the regular troops from the duties which would be most likely to endanger their health. There is no quarter of the world in which the faculty of Englishmen for leading inferior races in war has not already been tested. The Mussulman tribe of the Houssas has already supplied a valuable contingent; and there is probably no peculiarity in the character of the Fantees which should prevent them from acquiring, under proper guidance, the confidence in themselves which may enable them to face their hereditary enemies. The imitative tendency of African races has received a burlesque illustration in the silly mockery of a constitution which was lately devised by a few half-educated natives. In the order of political education, military obedience to superiors precedes representative and federal systems. The Fantees must be taught to defend themselves before they learn the more complicated lessons of civilization; and they must at the same time be taught that the protecting Power is not their ally, but their legitimate sovereign. The expulsion of the invaders will form an ample equivalent for the surrender of any nominal independence which may have been hitherto claimed by the native chiefs; and it is impossible to allow

them to exercise a discretion which may perhaps occasion future wars. It is too late to inquire whether the commerce of the Western Coast of Africa is sufficiently valuable to compensate for the burden of providing for the government and defence of a considerable territory. Many years ago the Government had resolved to abandon the settlements, when the English merchants, irritated on a small scale the enterprise of the East India Company, offered to undertake the expense and risk of administration. The Colonial Office, which has since resumed the duty of governing the English possessions, could not without disgrace withdraw from the conflict with the native invaders. The treaty by which the Dutch settlements were recently transferred supplies another reason for maintaining English sovereignty against the Ashantees. The arrangement would perhaps not have been made if the contracting parties had anticipated that both of them would, in two distant regions, be consequently involved in vexatious and costly hostilities. The Dutch probably desire a war in Atcheen as little as the English wish to expend men and money on the Gold Coast; but in both cases the rightful supremacy of Europeans will be asserted.

It is said that the cause of the war is the non-payment of an annuity or allowance which had been received by the King of ASHANTEE from the Dutch authorities at Elmina; but it is hardly worth while to investigate the mysteries of African diplomacy. The grievance of the Ashantees is in substance that their territories are inland, and that they require access to the coast which is occupied by the Fantes and controlled by the foreign authorities in the settlements. The result of the war will perhaps be to provide facilities for commercial intercourse which might render warlike incursions superfluous. Mr. DISRAELI some time ago, in his oracular fashion, announced that the secular ambition of Russia was caused and justified by a natural desire of finding an outlet to the Mediterranean. The Ashantees, if they were represented by an equally ingenious advocate, might explain the manifest destiny which leads them towards the Atlantic. As far as their objects are economical and pacific, it is highly desirable to encourage their aspirations. Although they have the defects of cruelty, superstition, and other attributes of uncivilized nations, their warlike energy implies the possession of many respectable qualities. When they have learned to recognize the superiority of European arms, they may perhaps be disposed to submit in other respects to some of the influences of civilization. It will probably be impossible at the close of the war to leave them in possession of absolute independence. Experience has shown that, although it is troublesome to manage the affairs of turbulent neighbours, it is nevertheless better to govern barbarians for their own good than to fight them periodically. An English protectorate over the accessible regions of Western Africa would arise as naturally, and therefore as legitimately, as the Russian dominion in Central Asia. Although it is no longer thought expedient to conquer distant markets, commercial relations sometimes involve a liability to enforce the observance of peace.

The plan of the campaign will not be prematurely disclosed even when it has been definitively formed. The general in command is probably fully aware of the danger and uncertainty of a campaign in the wooded country which has been occupied by the invaders. The scheme of an advance on the Ashantee capital, which would take the enemy on the flank and the rear, seems to civilians practical and plausible; but the most indispensable duty of the military authorities will be to provide against the dangers of the climate. The chief medical officer is distinguished for ability and energy; and the nature of the precautions which are required is well understood. Even in tropical climates it is found possible to preserve the health of troops by adequate sanitary arrangements, and the employment of native auxiliaries will in some degree obviate the necessity of dangerous exposure. It must be admitted that petty colonial wars are not to be regarded with complacency; but the enterprise which has founded English settlements in all quarters of the globe involves a liability to frequent risk and expense. The recent resolution of the House of Commons in favour of arbitration as the alternative of war is scarcely applicable to the quarrel with the King of ASHANTEE. Even if a reference could be arranged, and an umpire provided, an award could only be rendered valid by force. Mr. CORBET himself would find it difficult to prove that, in the present instance, the English Government has been actuated either by a childish desire of glory or by a wanton appetite for conquest. The war is undertaken for defensive pur-

poses, although it may not improbably result in annexation. It is unfortunately impossible that any conquest which may be effected should pay its own expense. The King of ASHANTEE has probably no hoards of treasure which can be reached; nor would it be easy to secure the payment of any tribute which might be imposed. The traders of the coast will be the immediate gainers; and the English taxpayer must be content to bear the cost of belonging to a great and complex Empire.

It would be cheaper and more convenient to cultivate intercourse only with those communities which are willing to trade freely with strangers; and if the question were open, the practice of founding trading settlements which afterwards expand into colonies would not now be deliberately commenced; but when adventurous traders have found it expedient to establish factories, and to enter into relations with native chiefs, it is difficult to reject their claim for protection and assistance. The flourishing colony of New Zealand was founded within the memory of the present generation against the wish and the avowed opinion of nearly all the responsible politicians who took an interest in the subject. It is certainly not a cause for regret that the islands were appropriated before the French had time to establish a title to the territory. As the settlers became more numerous they were necessarily involved in quarrels with the natives, and for several years considerable forces were employed by the mother-country in the wars which resulted from the occupation of native lands. The colony has now become strong enough to protect itself, and there is reason to fear that the indigenous population will gradually disappear. No similar change of circumstances will relieve the Imperial Government from the burden of protecting the trading settlements on the West Coast of Africa. The climate renders it impossible that the European inhabitants should increase largely in numbers, and the swarms of barbarians in the interior are probably inexhaustible. It will consequently be found necessary to establish a local sovereignty on the Indian model, and to govern or control the adjacent tribes in great measure by native agency. The advantages to the dominant Power may be doubtful, but the benefit to the country itself of a regular dominion would be incalculable. As long as the slave trade existed, European traders were the worst enemies of Africa. The kidnapped captives indeed might, if they could have foreseen the future, have been consoled by the prospect of leaving descendants who would be American citizens; but the trade disorganized and demoralized a large part of the interior of the continent. All commercial intercourse and all political or military interference is now likely to be beneficial. If the Ashantees or any other African tribes are left to themselves, there is no reason to expect that their condition will be in any way improved during the lapse of years. From foreigners they may probably receive some elements of civilization, and negroes have no tendency to die out like Maoris or North American Indians because they come in contact with a superior race. In the contest which must be the first step in the reclamation of the Ashantees, it is prudent to be prepared for possible miscarriage or disaster; but, sooner or later, the weaker party will necessarily give way. Although the war might perhaps not have occurred if the Dutch treaty had never been concluded, it will be now easier to deal with friendly or hostile natives in the absence of any civilized rival. The Ashantees would have been acute enough to take advantage of any occasion for promoting jealousies between the English and Dutch authorities. They will now be made to understand the necessity of submitting to the only paramount Power with which they can establish relations.

DISSENT AND SOCIALISM.

IT is a necessary inconvenience attendant upon a reconstruction of the Ministry directly after Parliament has been prorogued that for some weeks every one is left free to form his own conclusions as to what the changes really mean. The Education League have chosen to regard Mr. BRIGHT'S return to the Cabinet as significant of an abandonment of the educational policy hitherto supported by the Government. This is the burden of their resolution suspending overt hostilities until they have obtained some authoritative declaration of Ministerial intentions. "It is impossible to believe," says Mr. CHAMBERLAIN, in his article "The Liberal Party and its Leaders," in the current number of the *Fortnightly Review*, "that the statesman who only a few weeks ago declared the Education Act of 1870 to be the 'worst Bill passed by a Liberal Government since 1832' has now consented to condone legislation which he has so

"emphatically condemned; and it may be assumed that the great Tribune of the people would not have given his support to the Ministry unless he had previously assured himself of their renewed attachment to Liberal principles, and of their determination to apply them." On the other hand, Mr. GLADSTONE goes down to Hawarden as soon as Parliament has risen, and makes a speech which certainly reads, even after all possible weight has been given to his disclaimer of any intention that it should be so taken, like a plea for keeping the Education Act as it is. It seemed at first as though there was more comfort to be extracted from Lord FREDERICK CAVENDISH. But any hopes based on the report of his interview with the Yorkshire branch of the Liberation Society have been overthrown by his own very different version of what he said. The public equally with the League are left, therefore, to form their own conjectures of what the Government is likely to do in the matter of education. We have already given our reasons for regarding Mr. BRIGHT's appointment as having in this particular respect very little significance. He took office in the first instance because he was entirely at one with Mr. GLADSTONE as to the policy to be pursued towards Ireland. He was obliged to resign office on account of ill-health, and it entirely agrees with his character that, as soon as his health allowed, he should return to share the ill-fortunes of the Government as he had previously shared its triumphs. No doubt if the Education Act had been a measure which in its present form was intolerable to him, he would have been obliged to stipulate for a change in it as a condition of re-entering the Cabinet. But the very speech on which Mr. CHAMBERLAIN founds his reasoning seems to us to point the other way. It is true he began by declaring the Education Act to be the worst measure passed by a Liberal Government since 1832; but this was only the prelude to an admonition that, bad as it was, it ought still to be tolerated rather than that the Liberal party should be broken up. What a private person may do rather than secede from the Liberal party, a Cabinet Minister may do rather than secede from a Liberal Government. In either capacity Mr. BRIGHT will no doubt do what he can to modify the Education Act; but there was nothing in his speech to imply that he would make success in this direction a condition of taking or keeping office.

Mr. CHAMBERLAIN's article is valuable as showing what kind of concessions the Government will have to make if the Education League and its allies are to be conciliated. It may be inferred from it that the leading members of the League are becoming conscious that the 25th Clause of the Education Act is rather a small question when compared with the structure that has been built up on it. They, like the Government they are attacking, are in want of a cry. They are going to withdraw their support from the Government unless it does something to remove the causes of their discontent, and it seems at the last moment to have occurred to them that their discontent must be rather a one-horse affair if it can be appeased by a re-arrangement of the existing mode of paying the school fees of indigent children. Accordingly Mr. CHAMBERLAIN is put up to declare that "it is a mistake to suppose that the revolt of the Irreconcilables will be confined to agitation against the 25th Clause of the Education Act, or even against the whole educational policy of the Government." In other words, it is a mistake to suppose that the leaders of the Education League meant what they said when they first began to hint at a quarrel with the Liberal Government. "Mr. FORSTER's persistent determination to sectarianize education may be the first cause of active opposition"—thus much is conceded in order that the programme of the Irreconcilables may retain something of which Dissenters can take hold—"but when disorganization has once set in, the various elements of dissatisfaction will have full play, and the party will not again be reunited till a programme has been elaborated which shall satisfy the just expectations of the representatives of labour, as well as conciliate the Nonconformists who have been driven into rebellion." A singular retribution seems to be reserved for the Dissenting opponents of the Government. They have already been made a tool of by the Secularists, and they are now to render a similar service to the "representatives of labour." Mr. CHAMBERLAIN does not pretend that the working classes care for the theological side either of the Education or of the Church question. But though they may take little interest in the issue "so long as it is presented as a question of sectarian supremacy," they will "speedily recognize the importance of its political

aspects." In the sense which Mr. CHAMBERLAIN attaches to the political aspects of disestablishment, it is quite possible that the working class may be induced to make the controversy their own. They will be eager enough to claim for the nation as a whole the control and management of the vast funds which have been monopolized and misappropriated by an ecclesiastical organization." This is the agitation which is to "supersede and include all the minor subjects, such as the 25th Clause, the burials question, and the abolition of clerical fellowships." To what uses the nation will put the property thus regained from the Church is only darkly hinted by Mr. CHAMBERLAIN, but by combining his scattered suggestions it is possible to make a pretty confident guess at their drift. "Education," he says, "is demanded as much in the interest of the nation as of the children, and will bring more direct advantage to the community than to the parents themselves. It is just, therefore, that its cost should be a national concern and should be divided equally among the contributors to the national income." This reasoning may easily be extended to matters which come home to poor men a good deal more than education. The maintenance of children concerns the interest of the nation. Hunger and nakedness are as much the parents of crime as ignorance can be, and nothing would bring more direct advantage to the community than a law which ensured that every boy should be properly fed and clothed as well as properly taught. It will be equally just, therefore, that the cost of this maintenance should be "divided equally among the contributors to the national income." Mr. CHAMBERLAIN's expression of contempt for the "fashionable political economy" which "buttons up the breeches pocket" against the demand for free schools will be quite as applicable to the fashionable economy which buttons up the breeches pocket against the demand for free dinners and free outfits. It is significant that Mr. CHAMBERLAIN should claim the candidature of Mr. JENKINS at Dundee as one of the evidences of the League's influence. We know pretty well the kind of philanthropy which inspires this gushing statesman. Its leading principle is that the State should do as much as possible for working-men, and if anybody ventures to ask whether the natural result of this policy will not be to make working-men do as little as possible for themselves, he is set down as a preacher of the "gospel of selfishness." It is not wonderful that working-men should listen complacently to this sermon. They have not the education which would enable them to see the abyss of pauperism into which it must lead the nation that puts it in practice. But that Dissenters, whose gospel hitherto has been of the very opposite sort, who have been the typical representatives of the middle class—the class of active, self-reliant, self-providing men of business—should now find themselves committed to the programme of *Gin's Baby*, is a startling instance of the lengths to which politicians may be led when they put the gratification of sectarian pique before the welfare of the community at large.

One admission, however, Mr. CHAMBERLAIN may fairly claim. He has justified the position of the party which he has christened the Irreconcilables. As there can be no real union in France between the Communist and the Conservative Republican, so there can be no real union in England between Liberals who take for their "new departure" the cry of Free Church, Free Land, Free Schools, and Free Labour, and the party which has hitherto supported Mr. GLADSTONE. There may be a sense in which each of these watchwords is defensible, but in the alliterative combination in which Mr. CHAMBERLAIN uses them, they either mean Socialism or nothing. That the Dissenters may gain a momentary strength by buying the alliance of the working class at the vendors' own price is possible. They have the advantage of a ready-made Parliamentary organization to offer in exchange, and to secure this for the accomplishment of their own objects, the working class would perhaps be ready to forego an interest in the withdrawal of aid from voluntary schools, and the repeal of the 25th Clause, which they are very far from feeling. But the Dissenters, if they are prepared to effect this combination, may as well effect it without further delay. The mere fact that they are prepared to do so makes a gulf between them and the Liberal party, as the term has till now been understood in England, which time can do nothing to bridge over. If they think that by delaying their secession they can carry the Government with them, it is only an indication that they do not really take in the meaning of their own threats.

PARTIES IN AMERICA.

THE two political parties in the United States are for the present chiefly occupied in the endeavour to discourage rival organizations. Both Republicans and Democrats denounce ambitious attempts to form new combinations; nor is there any reason to suppose that a change in the name or in the avowed doctrines of either party would be for the public benefit. Both English and American experience have repeatedly illustrated the difficulty of creating a third party, or of exercising independent influence after a political secession. The Peclites have long since been absorbed into the Liberal party; and only a year ago the Liberal Republicans were utterly defeated in the Presidential election. The farmers of Illinois and of one or two other Western States will probably return to the next Congress members who will be instructed to concentrate all their efforts on the reduction of railway charges; but it is impossible to elevate local dishonesty and selfishness into principles of political action. The majority or minority will purchase the support of the Farmers' Union by promises of aid which it will not be thought necessary to keep. Many of the doctrines of either party have been incorporated into the recognized creed in pursuance of similar bargains. There is no apparent connexion between the principles of the Republican party and the system of protective duties; but the Republican Convention of Pennsylvania has lately once more pledged the party to the exclusion or discouragement of foreign imports. The Democrats, on the other hand, for the most part profess sound commercial doctrines, because before the war their strength lay in the agricultural constituencies of the South. Although it is right and natural that the Western farmers should be opposed to protective tariffs which are directly hostile to their interests, their own demands are precisely analogous to the pretensions of the manufacturing monopolists in New England and Pennsylvania. In both cases the common object is to profit at the expense of others. The ironmasters and cotton-spinners of the Atlantic States plunder consumers throughout the Union; as the Illinois farmers seek to appropriate to themselves the income of the Railway Companies. If it is true that the Companies have by bribery and corruption obtained undue privileges from the State Legislature, it would be desirable to counteract their intrigues rather than to imitate, and so partially to justify, corrupt practices. It is possible that the railway rates may interfere with the prosperity of the export trade in corn, but the amounts which are levied must have been legally authorized, and there is no presumptive proof that they are even excessive. Capitalists would not have constructed railways through thinly peopled districts, except in the hope of a profit far exceeding the ordinary rate of interest on money; and a retrospective limit imposed on their charges for the benefit of customers who happen to control the elections to the Legislature is an act of fraudulent violence. The first operation of the Farmers' League conclusively proved their consciousness of their own injustice. A Judge was elected for the express purpose of deciding suits against the Railway Companies, not because he was equally capable with his competitors, but on the ground that he could be trusted to be partial. The Protectionists of the Eastern States are not incapable of providing in the same manner for the protection of their own interest; but their objects are effected by the aid of ill-informed or dishonest legislative bodies, and not by the agency of one-sided judges. It is mainly in consequence of the wide prevalence of political dishonesty that the candidature of General BUTLER for the office of Governor of Massachusetts excites a certain amount of interest. No other politician so fully represents all the worst elements of American society and political life. Coarse, unscrupulous, and corrupt, Mr. BUTLER is nevertheless the most prominent representative of the dominant party; and he has repeatedly been returned to Congress for one of the districts of the State by large majorities. In a former Congress he was, after Mr. THADDEUS STEVENS, the most active and successful advocate of repudiation; and the dislike which is felt and expressed for his character by all the more respectable politicians constitutes a title to popular confidence. The critics and the eulogists of American institutions may respectively find plausible arguments for blame and praise in the career of General BUTLER. That such a person should be a probable Governor of Massachusetts, and a possible President of the United States, would seem to be a proof of the fallibility of universal suffrage and social equality; but a country which contrives to prosper under

the BUTLERS, the COLFAXES, the MURPHYS, and the TWEEDS must possess inherent stability and soundness.

A far more important matter in another part of the Union causes both interest and anxiety. The negroes of the Middle States are moving southward in large numbers, while a counter-stream of emigration of the white inhabitants to the North is said to have commenced. That the negroes should prefer the regions which are best suited to their constitution and tastes is perhaps not surprising; but it is scarcely probable that the white population should have already found the condition of their native States definitively intolerable. Labourers and squatters will easily find homes for themselves in the rich plains of the South; but landowners and traders will submit to much inconvenience and oppression before they abandon their property and change their habits of life. Combinations of Northern adventurers with ignorant masses of negro voters have, in some of the Southern States, excluded the genuine citizens from all share in the administration of their own affairs; and even when the Republicans have, as in Louisiana, failed to obtain a majority, their usurpation of power is defended by all the resources of the Federal Government. It was perhaps almost inevitable that one of the two races should be treated with injustice. The former slave-owners would probably have abused political power; and, as an alternative, they are compelled to submit to the domination of an inferior race. The effects of the secession have not been in the smallest degree effaced, nor has the process of reconciliation between North and South hitherto even commenced. The existing inversion of social and political order can scarcely be permanent, and if the influence of the Federal Government were no longer exercised in favour of the coloured race, no preponderance of numbers would counterbalance the natural superiority of their former masters. The possible establishment of one or more black communities as States belonging to the Union is a contingency which cannot be regarded with satisfaction; nor indeed is it probable that the American people would allow national elections and political issues to be decided by the votes of negro electors or their representatives. It is not impossible that at some future time the Constitution of the United States may be so far modified as to include contrivances for the government of dependencies. If San Domingo and Cuba are annexed, it will be necessary to treat them as colonies and not as co-equal States; and Florida or Louisiana, if they were exclusively inhabited by negroes, would have little claim to a political preference over other communities of the same origin. The civilization and political activity of the American negroes will long be purely imitative.

The Democrats of Virginia, who have in their own State retained the control of political affairs, not unfairly contrast the success of a "white man's Government" with the corruption and incapacity which prevail in neighbouring States under the management of the coloured constituencies and their nominees. In North Carolina also the dominant race is recovering its power; but the local Democratic leaders are bent rather on expressing their indignation against their recent oppressors than on displaying their own superiority in honesty and wisdom. A Convention has determined on abrogating a part of the existing Constitution which declares the public debt to be inviolable, and also another section which imposes on the Legislature the duty of providing by due taxation for the payment of the interest and principal. The passionate and thoughtless decision of the Convention furnishes a new and unnecessary proof of the familiar proposition that wrong tends to propagate wrong in an interminable series. A few years ago the Republican Government of North Carolina committed frauds in relation to the public debt which equalled in magnitude and audacity the typical operations of TWEED and his allies in the city of New York. The taxpayers of the State were impudently plundered for the purpose of enriching HOLDEN, the Republican Governor, and his accomplices; and the notoriety of their dishonest practices probably produced the subsequent reaction. The proper remedy would have been the prosecution and punishment of the delinquents, and not the repudiation of contracts made with creditors who are probably innocent of complicity with the culprits. It is unfortunate that proposals to repudiate debt should in America provide so ready a mode of attaining popularity. Six or seven years ago an overwhelming majority in the Lower House of Congress passed resolutions in favour of defrauding the national creditor, and at that time both the

Democratic and the Republican leaders openly advocated payment of the debt in a debased currency. The President of the day, in a desperate attempt to recover popularity, even recommended that the debt should be confiscated, by the simple process of reckoning the payments of interest as instalments of the principal sum. The Democrats of North Carolina have a more plausible excuse for refusing to acknowledge obligations which were fraudulently contracted on the part of their Government; but a State is responsible for the proceedings of those whom it allows, however unworthily, to represent it; and, if regard for public honour is not a sufficient motive for the discharge of an obvious duty, angry politicians ought to recollect that, in disavowing the acts of their predecessors, they are inflicting a disability on themselves. No capitalist will, in North Carolina or elsewhere, lend money to a Democratic Government which may in its turn be displaced, when a previous loan has been repudiated because the money was advanced to the Republicans. The superior race is, in the Southern States especially, bound to furnish an example and a contrast to the ignorant negroes and their dishonest leaders. The counties of North Carolina in which the coloured vote preponderates are unanimously opposed to the scandal which is contemplated by the majority. It is a grave mistake to force a discredited adversary into a position where he will find himself involuntarily and unexpectedly in the right. If the natural rulers of the South are to resume and retain their due supremacy, they ought to be more scrupulous and more prudent than the multitude which they seek to supersede and to govern.

A MONTH'S RAILWAY ACCIDENTS.

WE have got into September now, and it is possible that in the course of another week or two the briskness of railway slaughter may be somewhat mitigated. As it is, accidents continue to be of almost daily occurrence, and if they are not invariably attended with fatal consequences on a large scale, it can hardly be said that this is the fault of the Companies. They do all they can, but there are accidents in favour of the public which are apparently beyond their control. In the collision on the Metropolitan District Railway there was considerable novelty, and we should have said ingenuity, if the idea had not been so exquisitely simple when once it is thought of. Between Victoria Station and Sloane Square the axle-rod of an engine broke; the driver removed the broken rod, and resumed his journey. The train went very slowly; at Sloane Square, South Kensington, and Gloucester Road stations it was seen to be in difficulties; but still the driver persisted in going on, apparently with the approval of the officials at each station. Just before reaching High Street, Kensington, the engine broke down finally in a tunnel, where it was run into a few minutes afterwards by another train from the south. A great many people were hurt, but fortunately no one was killed. To appreciate the beauty of this accident—for it is impossible not to consider it from an æsthetic point of view—it must be borne in mind that the line is worked strictly on the block system, and that, at this part of it at least, there is no complication of points, the trains simply following each other in the same direction, with a brief interval between. Here, if anywhere, it might be thought, a collision would be practically impossible. Yet this is how one happened. Immediately after the disabled train left Gloucester Road the succeeding train arrived, and waited for the signal to go on. As this did not come, the signalman at the High Street station was telegraphed to in order to let him know that a train was ready to come on. There was then no train actually in his station; so he replied that it was free, the other train was sent on, and the accident occurred. Nobody took the least thought of the broken-down train in the tunnel. It would appear, therefore, that the "block system" on the Metropolitan District Railway takes no note of the tunnels which compose the greater part of the line. *De non apparentibus et de non existentibus eadem est ratio.* A train which has dived out of sight into a tunnel, and has not come to light again, is assumed to have dissolved into thin air. It might be thought that on such a line some means would be provided for ascertaining that tunnels as well as stations are free before trains are sent on. But perhaps this is only what Sir E. WATKIN would call a "fad." As it is, the block system merely ensures that a train which cannot get through a tunnel will be cannoned on in a minute or two by the succeeding train.

The breaking of an axle-rod is not an unheard of occurrence, and an axle-rod is just as likely to break in a tunnel as anywhere else. In this case, it is true, the engine was known to be disabled before it passed out of sight; but that only makes it the more extraordinary that it should never have occurred to any one to inquire whether it had succeeded in reaching the next station. This is another striking instance of the way in which railway officials are content, not with safety, but with the mere chances of safety. There was a chance that the engine would pull through, and there was a chance that it would break down, and the one was set off against the other. It is clear that on a properly conducted railway a disabled engine should not be allowed to proceed on its journey on a bare chance of not coming to a standstill in a tunnel, where the driver would have no means of communicating his plight to the station at either end, and where he could do nothing but wait—with his passengers—to be run into.

Anybody who wishes to understand how English railways are managed, and the sort of care which is taken of the lives of travellers, cannot do better than go back over the accidents of the last month. The season began on the 1st, when there was a collision on the North-Eastern near North Shields, by which several carriages were broken and a number of passengers injured. Early next morning came the terrible Wigan accident—fifteen killed and many maimed and wounded; and on the afternoon of the same day a couple of trains ran into each other at Redhill, on the South-Eastern. There were collisions on the 4th and 6th on the Lancashire and Yorkshire, and on the 5th on the Great Western—two killed. On the 7th a goods train near Yarmouth was broken up by an axle giving way, and next day a similar accident occurred on the Somerset and Dorset Railway. On the 9th part of a train was thrown off the rails at Miles Platting by defective points. On the 12th an engine on the North-Eastern was in a similar way turned into a siding, while the carriages kept to the main line. The buffers of the carriages were twisted, the chains bent, the ballast ploughed up, sleepers torn from their places, carriage windows and sides smashed, but, "strange to say, nobody was injured." This was probably because the train was going at only some twelve miles an hour. The points were on the old balance-weight principle. On the 15th the points at Wigan again played false, and an engine and three carriages of a train were turned into a siding, while the rest kept to the main line; but the train was only just starting, and not more than one carriage went off the metals. On the 18th an express ran into a train of empty carriages on the Lancashire and Yorkshire, and shivered several of the empties into "small fragments," which would no doubt have been the fate of the passengers, had there been any. The express escaped with slight injury. On the 22nd two trains, both late, ran full tilt at each other at Eastbourne; several persons hurt and one killed. Next day there was the dreadful collision at Retford, between a fish train and an excursion train, three killed and thirty injured. On the 25th an excursion train in a fog was run into by a goods train on the Manchester, Sheffield, and Lincolnshire Railway, a great many persons being hurt. On the same day a train on the North-Eastern cut in pieces a flock of sheep which had found the line open to them; and three valuable racehorses and a jockey were badly hurt by a train on the South-Western having been turned into a siding by defective points. Last Saturday there was the Gloucester Road accident. On Tuesday the engine of a train from Sunderland to Hartlepool left the rails, dragging four carriages after it, and knocking away the buttress of a wooden bridge over the line. The bridge fell on a carriage and buried the inmates. Two boys who were on the bridge were injured, and one of the passengers killed. It is suggested that if the accident had happened at the dinner-hour, when this bridge was usually crowded, the loss of life would have been appalling. On Thursday a goods train on the Great Western ran into a herd of cattle, and afterwards came into collision with another goods train.

We do not know that there is any particular use in writing about these railway accidents which are constantly happening, unless it be to prevent the public from sinking into helpless and apathetic resignation on the subject. This is a frame of mind which would suit the railways very well, and officials of all kinds would seem to be doing their best just at present to encourage it. There must be accidents on railways, and people must just make up their minds to take the chance of them as a matter of course—this is the only answer to be got from directors, traffic-managers,

engineers, station-masters, and all the rest of them. Accidents, we are told, will and must happen, and it is no use trying to prevent them. Even if they were prevented in one way, they would be sure to happen in some other way. After everything has been done, a great deal must, in the nature of things, be left to engine-drivers and signalmen and persons of that kind, and it is impossible to guarantee that they shall never be wanting in discretion or steadiness. Strict rules may be drawn up, but at a critical moment they may be disobeyed. All sorts of ingenious mechanical precautions against accidents may be adopted, but when they are most wanted the men whose duty it is to work them may get drunk. A very little thing is enough to cause an accident, and the conditions of railway travelling are such that, if anything does go wrong, the results are apt to be extremely serious. Taken altogether, therefore, railway travelling is, and must be, very dangerous, and the perils to which passengers are exposed must be accepted as an inseparable element of the advantages they enjoy. They are the price of quick travelling. This is really, without any exaggeration, the argument which is pressed upon us by railway officials in reply to all complaints and remonstrances, and there is perhaps just enough plausibility about it to make it dangerous. It is quite true that there are no means of making railway travelling absolutely safe. All the precautions in the world will not ensure that an axle will never break, or that a signalman or driver will never neglect his duty. In this respect railways stand on precisely the same footing as other modes of locomotion. There is always a chance of accident when one goes out for a walk or for a ride in a carriage or on horseback. All that is asked of the Railway Companies is that they should do what they can to reduce the chances of disaster on their lines, and not make the fatalistic principle the foundation of their policy.

The accusation against the Companies—and they must not be allowed to evade it—is that they systematically work their lines in such a way as to multiply the dangers of travelling. To the end of time station-masters, engine-drivers, and signalmen will retain human imperfections, but it is possible to make arrangements by which the effects of a failure of duty on their part may be rendered comparatively harmless, and by which also they may be so surrounded by checks and precautions that a failure of duty will not be very likely to occur. We do not find that the Companies make or attempt to make any arrangements of this kind. On the contrary, we find that they deliberately and uniformly conduct their business in such a manner as to increase the liability to error on the part of their working officials, as well as the chances that, if any error is committed, it will lead to a grave disaster. Just consider, for example, the account given the other day of Wigan Junction—a narrow, inconvenient station, overwhelmed with all kinds of regular and irregular traffic from four or five different lines, passenger trains dashing through at full speed, fitful excursion trains, and goods trains—those chartered libertines of the railway world—dodging in and out, and shunting perpetually going on. The whole place is a confused maze of “points,” and drivers look back with relief when they see that the whole of their trains are actually behind them. We are not now discussing the recent Wigan accident. We are simply pointing to a state of things which has almost the appearance of having been purposely arranged with a view to the multiplication of what are called accidents, and which must from time to time produce them. Again, take the evidence of the station-master at Wilton, which we quoted last week, and in which he pleaded that he had to be at work from six in the morning to half-past nine o'clock at night, and sometimes later, with only a single porter to help him; and that he had, in addition to the proper duties of station-master, to act as accountant, booking-clerk, and ticket-collector, and to attend to the telegraph. If a man in such a position made a mistake, it would be only what we should expect; the wonder would be if he did not. The Retford accident points in just the same direction. Nothing could be better devised for the production of accidents than the level crossing at which the recent collision occurred. There were signals to warn off trains, and there was also a rule that trains should stop at Retford; but it is known that signals and rules are not always obeyed with much strictness. The diary of the signalman at the crossing showed that the line here was frequently “fouled,” and that trains were delayed. The principal causes of recent accidents may thus be summed up:—Defective points,

broken axles, imperfect telegraphic communication, disregard of signals, unpunctuality, and level crossings; and most of these are capable of being dealt with. With larger stations (which would render fewer points necessary), continuous brakes, greater punctuality, and a careful system of telegraphing trains, accidents would be greatly reduced both in number and gravity. It is absurd, however, to suppose that a couple of lines of rail will for ever suffice for rapidly growing traffic, and the Companies would certainly do well to consider whether it would not pay them better to dispense with excursion trains, and offer greater facilities to regular third-class passengers. The question remains how the Companies, if they will not do it voluntarily, can be compelled to pay more attention to the safety of travellers, without escaping from the responsibility which now rests upon them.

WATER AND DUST.

WE called attention some weeks since to the description given of the water supply in a large number of towns and villages by the Inspectors of the Local Government Board. Throughout their reports one characteristic presented itself with sickening regularity. In almost every case the drinking water was polluted by sewage. It came either from a stream into which sewage was poured, or from wells into which sewage percolated. Members of the Legislature may perhaps be roused to an unusual display of sanitary zeal by the reflection that they can never be sure that they and their families will not pay the penalty of this diffused impurity. In their country homes they may take care that the well which supplies the great house is unaffected by the evils which may at any moment make the wells that supply the village outside the park gates as deadly as though they had been poisoned. But when they come to London they will probably have to drink milk brought from country dairies, and the experience of the last few weeks has taught us how easily this milk may become the vehicle of unsuspected dangers. The account of the dairy farm from which the milk of the Dairy Reform Company was in part drawn would probably be equally true of hundreds or thousands of others. If even the washing of a milk-can with water containing the germs of typhoid poison may render the milk a channel of infection to all who drink it, there can be no security for the purity of “country” milk except the purity of the water supply in the district from which it is sent. Yet upon “country” milk London largely depends, and is likely to depend still more. As the population becomes larger, it grows less and less convenient for a London dairyman to keep his own cows; while at the same time the extension of railways makes it more and more easy to buy his milk from farmers living at a distance. The conditions under which cows must live in large cities can hardly be favourable to animal health, but in the case of milk supplied from a country farm there is the greater, or at all events the more immediate, danger of the milk being charged with the specific infection of known human diseases. A man may drink sewage with apparent impunity so long as it does not contain the discharges of typhoid or cholera patients. But a single case of either of these diseases is enough to make any water into which the sewage penetrates, or any milk to which any of this water has been added, highly infectious. There is no need that this addition should be made intentionally. The few drops left at the bottom of the can after it is washed will answer the purpose. No other polluting cause seems to have been present in the Marylebone epidemic, and there is no reason to doubt that the agent which was so efficacious in this case will be equally so in every similar case. The dangers apprehended from sewage farms may deserve careful investigation; but, even if the general wholesomeness of milk can be shown to be thus affected, its contamination by typhoid poison must be accounted for in some other way. What that way is our knowledge of the action of this and similar poisons on water is sufficient to tell us.

The lesson of the Marylebone epidemic is to be sought therefore further back than the milk supply. It is important that every care should be taken to keep this pure; but no care will achieve this which does not go beyond the dairy. If an adequate supply of pure water were provided for the whole population, we should have closed up one of the two main channels through which infection is conveyed. We

have seen that wherever the Local Government Board has had occasion to examine the water supply, it has been shown to be directly exposed to sewage pollution, and the causes which have produced this are so universal that it is impossible not to suspect that the pollution is equally universal. The drainage of the rural districts is provided for, where it is provided for at all, by a system of cesspools. From one cause or another this almost everywhere implies that the water is more or less impure. If the cesspool and the well are far enough off from one another, or if the cesspool is lined with some non-porous material, there need, of course, be no danger. But where there is very little space, as happens with most cottages, or where, to save trouble or expense, the well and the cesspool have both been placed as near as possible to the house and to each other, as happens with many houses of somewhat more pretension, and where the cesspool is merely a hole dug in the earth or lined at most with a few loose bricks, there is nothing to prevent the overflow from finding its way by degrees into the well whence all the water used in the household is drawn. Wherever the attention of the Local Government Board has been called to any special outbreak of disease, this is the state of things which it almost always finds existing in the neighbourhood; and we repeat that where a discovery of this sort is made with such extraordinary regularity, it is unfortunately but too safe to conclude that it will repeat itself in the great majority of cases throughout the country. Still an inference of this kind is hardly a sufficient foundation for legislation, and it is improbable that the means of putting the necessary pressure on the local sanitary authorities can be attained without legislation. What is wanted is an array of facts which the most obstinate sceptic cannot resist, or at all events cannot disprove, and the existing sanitary machinery is amply sufficient to provide this. In every district there is now an authority charged with the care of the public health, and bound to appoint a Medical Officer of Health. If the Local Government Board were to require from each local authority a full and carefully prepared report on the water supply of the district subject to them, it would obtain what it asked from a great many; and wherever the report was insufficient or presumably inaccurate, as in many cases it would be, the Local Government Board might supplement it by a report from one of its own officers. By this means Parliament would be put in possession of full and exact data as to the nature of the water supply throughout the kingdom; and, careless as Parliament too often is where the public health is concerned, it is difficult to believe that its indifference would survive the revelation.

There are other sources of disease besides bad water, and one of these enjoyed for a short time a rival popularity as the supposed source of the typhoid fever in Marylebone. Until the evidence against the milk became too conclusive to be resisted, complaints used to appear every day of the state of the dust-bins in various parts of London. The philosophy of this unpleasant feature of a London household lies in a very small compass. A dust-bin need not be offensive, but it very often is; and it can only be prevented from becoming so in one of three ways. One is to put no vegetable or animal matter into it, in which case it will contain nothing that can decay. All matters of either kind should be thrown on the kitchen fire and burnt. The objection to this plan is that hardly any servant will take the trouble to carry it out without constant supervision, the handiness of the dust-bin constituting an almost irresistible temptation to making it the recipient of all the cabbage-stalks and potato-parings of the household. The second plan is to cover each addition of vegetable or animal matter with some disinfectant in order to arrest decomposition. If this is done regularly, and the dust-bin emptied at not too long intervals, no great harm can come of it. The objection to this plan is that it involves some expense, and consequently is not likely to be adopted by the poor. The third plan is to supersede the dust-bin by a dust-box, which can be placed in the street and emptied into the dust-cart every morning before the world is stirring. This, we believe, is the system in use in Edinburgh, and it is the only one which has any real value as a preventive of all accumulation of noxious matters. No time is allowed for decay, and consequently no care need be taken either to keep vegetable refuse out of the dust-box or to disinfect it when there. But before this system can be introduced into London there must be a radical change in the ideas of the Vestries.

At present the theory is that the removal of dust is a favour accorded to the inhabitants. If they like to keep their dust-bins full, they are free to do so; the duty of the Vestry is performed when they have been given the opportunity, at rare and uncertain intervals, of getting them emptied. Where dust-boxes have taken the place of dust-bins, the theory is that it is the duty of the inhabitants to place them each morning where their contents can be removed, and any householder who omits to do this becomes liable to a penalty. By this means one source at least of disease is got out of the way, and the annoyance which the dust-cart so often causes to the noses of the passers-by is reduced to a minimum. At present the carts go about all day long, and their contents are largely made up of vegetables in every stage of putrefaction. Under the proposed system the work is done by noon, and the contents of the carts are, in comparison with what they are now, clean and harmless. The adoption of this plan is the only means by which the dust-bin nuisance can be really abated, and as such we recommend it to the consideration of the London Vestries.

THE ENGLISH PILGRIMS.

IF the main object of the English pilgrimage to Paray-le-Monial was, as one of the early converts expressed it, "to inflict on an unbelieving age a sense of the supernatural," the pilgrims could hardly have selected a better time than the present for delivering what the synodical letter of the "Archbishops and Bishops of England" calls their "resplendent testimony against the unbelief and wickedness of the world." In the depths of the silly season even the *Times* is more than willing to be exuberant on so promising a subject, while the ordinary raptures of the *Telegraph*, *et id genus omne*, are sure to be redoubled. The pious expedition, alike in its gay and its graver aspects, has, in fact, become the leading topic of the week; and if a yearning for posthumous reputation was among the human weaknesses of the Blessed Margaret Mary Alacoque, it has never perhaps since her death been so abundantly gratified. Not only have the Roman Catholic Archbishop and the premier Duke of England contrived to attract to her shrine a concourse which is variously estimated at from five hundred to a thousand votaries, but they have succeeded in concentrating for the moment on her alleged revelations the curiosity or the contempt of the whole newspaper-reading public of the country. The record of functions, benedictions, trains resonant with sacred chants, and steamboats with the Papal flag and banner of the Sacred Heart streaming from their mainmasts, has overflowed the columns of the daily papers, till articles, telegrams, and Correspondents are as full of the pilgrims and their doings as they were two months ago of the Shah. Where the sacred travellers last breakfasted, dined, prayed, or slept, has been chronicled with all the circumstantial minuteness of a royal progress. On the philosophy of pilgrimages in general, and the history of this particular form of pious peregrination, we spoke the other day; nor is there anything in the solemn rebukes which have since been administered to profane critics by episcopal and archiepiscopal lips to affect the force of our remarks. We can easily believe that an imposing and picturesque effect was produced by the brilliant initiatory ceremony performed at the pro-Cathedral at Kensington on Monday last before the chosen deputations from England, Scotland, and Ireland started on their journey. And nobody who knows anything of Dr. Manning will be surprised to hear that he was quite equal to the occasion. No Roman Catholic ecclesiastic has succeeded in attaining so influential a position in England since the Reformation; he knows that what he has to say will be listened to with respect, while those who are least able to trust his judgment will not refuse to credit him with sincerity. It was accordingly to the Protestant public rather than to the devout crowd assembled in the pro-Cathedral, with the red cross and heart on a white ground emblazoned on their breasts, that the Archbishop's discourse was in reality addressed. And his eloquent appeal displays at once the strength and the weakness of the cause for which he was pleading; its strength, so far as it is a genuine appeal to the Christian conscience of his audience; its weakness, so far as it professes to be an apology for the pilgrimage to Paray-le-Monial.

After referring to the solemn benediction of the Provincial Council at Ware, and the "greater benediction" in the shape of a plenary indulgence, received direct from the Holy Father, the Archbishop reminded his hearers that their pious expedition had been scoffed at as a paltry nineteenth-century imitation of the tedious and penitential pilgrimages of former days, and he begged them to be not only patient, but thankful, if they should have any hardships to endure. And it may readily be allowed that two days' continuous travelling for over twelve hours at a stretch is a severe tax on the endurance of ladies, though no more than they are ready every year cheerfully to undergo when health or recreation is the only object of the journey. But the monotony of the journey must be somewhat broken, without the fatigue being increased, by the use of the devotions prescribed to be recited in common on the way. The country to be traversed is not a particularly interesting one, but the pilgrims need hardly be prevented from seeing whatever there is to see by the recitation of occasional prayers which cannot, at the outside, employ above

one hour out of the twelve or fourteen occupied each day on the road. They seem, indeed, to have felt quite at liberty to supplement the appointed manual with a full allowance of morning papers and cigars. Still less is it true, as the *Times* assumes, that they will have to return "in life bondage to the laws of the paganant." On the contrary, the paganant was to conclude with a solemn *Te Deum* on Thursday evening at Paray, and the travellers are free to return when and as they like, their tickets being available up to the 16th instant. Some, we dare say, will avail themselves of the proffered opportunity of reconciling the Church and the world by appending a fortnight in Paris to the pious observances at Paray. It must be remembered, too, that if nearly one-half of the pilgrims are women, nearly half the men are priests, and comparatively few of the lay itinerants belong to the upper classes, who have for the most part preferred to "share in the graces of this national act of homage" by proxy, subscribing for pilgrims who are too poor to pay for themselves, and who are probably not at all averse to discharge a vicarious office which in their case at least combines pleasure and piety, and does not cost them anything. We are further informed by a spectator of the departing band at Victoria Station that "the general hubbub was traversed by a rich vein of brogue," and migratory habits are natural to the denizens of the Emerald Isle. On the whole, it may be presumed that the sufferings of the devout tourists will not have been very severe, although their method of pilgrimage is not quite so easy, while it is more entertaining, than that indulgently provided by His Holiness for the faithful of Italy, who can now visit the Holy Land and all the principal sanctuaries of Europe, by the aid of a sort of spiritual *Stay-at-Home Traveller*, without leaving their own doors. Our English pilgrims will at least be able to boast of having crossed the Channel, and passed through a good part of France in the flesh as well as in the spirit. And if they find, as the Archbishop bids them, any solace for the privations, or the absence of privations, they endure, in the censure and ridicule of an unbelieving world, we should be sorry to deprive them of the consolation.

But is a smile or a shrug at the supernatural sanctity of Paray-le-Monial a necessary sign of unbelief? Dr. Manning seems to say that it is, but his argument strikes us as an odd one. There have been from the first, we are told, pilgrimages to the Holy Land, and why not as well make a pilgrimage to Paray? Moreover the devotion to the Sacred Heart is spread throughout the universal Church, and no Christian can with consistency deny the interpretation of this patent fact supplied by the miraculous revelations of Margaret Alacoque. Nay more, to deny the miraculous origin of this world-wide fact is, the Archbishop observes, to make a demand on his credulity which goes beyond the bounds of his faith. Yet he proceeds at once himself to suggest what will appear to most of his readers, if not of his hearers, a far more reasonable interpretation of the fact. Devotion to the Sacred Heart may of course be explained in different ways, but obviously in one sense—and it is precisely that on which Dr. Manning descants most eloquently—it is, to use his own words, "as old as the Gospel, and is what Jesus taught in Jerusalem." Its prevalence in the Church does not depend therefore on the visions of an obscure nun in the sixteenth century, and probably nine-tenths of those who most devoutly practise it never heard her name before the last few weeks. And even if devotion to Margaret Alacoque was—as surely it is not—as common among Roman Catholics as devotion to the sacred objects which are now associated with her name, Dr. Manning forgets that the active propagandism of by far the most energetic and influential religious order in the Church, carried on unflinchingly through two centuries, would supply an explanation to the full as plausible as his own. Naturally enough he is anxious to deny or disguise the political aspect of the pilgrimage, and represents it as mainly a public demonstration of faith in the power of prayer. That does not, however, prevent his making a pretty significant allusion to Germany and Switzerland, "nations persecuting the bishops and pastors of Christ," and "that Empire drunk with success, blinded with unbelief, which is venturing to lay hands on the successors of the Apostles." What he does seem to forget is that faith in the power of prayer could be demonstrated as well in London or Paris as at Paray. His suffragan, Bishop Vaughan, is more outspoken when he tells us that "there can be no doubt Almighty God is pleased to hear prayer in one place more favourably than in another," and that this is the true rationale of the pilgrimage. Yet even he is careful to insist that "the Church has set no seal on these visions and revelations of Margaret Mary," though he infers from her Beatification that the historical facts have been tested by the ordeal of the severest criticism. Considering that "the historical facts" about St. John of Nepomuk passed a still severer ordeal, as he is not only beatified but canonized, our readers may be tempted to doubt the conclusiveness of the test.

We have said that the pilgrims are exhorted by Dr. Manning to pray for the conversion of the persecuting Governments of Germany and Switzerland. They are also to pray for England, for Scotland, for the heathen, for the Church in East and West, above all, for the Pope, and for every one and everything else, with one notable exception—"the Church in Ireland, faithful, firm, inflexible, invincible, does not need your prayers." We trust the gentlemen with the rich vein of brogue were gratified by this touching assertion of the absolute perfection of their national Church. The Emperor Sigismund claimed to be *super grammaticum*; henceforth the Irish Church, which has recently vindicated its superiority to the proffered boon of education, will enjoy the unique distinction

of being *super intercessionem*. The more laudable is the zeal of the Irish contingent, who need no intercession, in resorting to Paray to intercede for their less fortunate neighbours.

It is perhaps a little disheartening to find that, just as this "resplendent" crusade of prayer is being organized against "the kingdoms and nations which, with an obstinate audacity, have refused to serve God and His Christ," as the synodical letter from Ware expresses it, the first signs of submission to Imperial audacity are reported from Germany, where Archbishop Ledochowski has at length agreed to conform his seminaries to the requirements of the law. But then there is no saying what the restoration of legitimate monarchy in France might not do towards humbling that "Empire drunk with success" which Archbishop Manning has commended to the especial attention of the pilgrims. And when we keep in mind Bishop Vaughan's assurance that God is undoubtedly pleased to hear prayers in one place more favourably than in another, it is impossible to say what may not be effected for the restoration of Henry V. by the pilgrimage to Paray-le-Monial. To be sure, Dr. Manning is very indignant with the blind world for imputing political motives to the pilgrims. But then he makes a special reserve in favour of "the politics of the kingdom of God." That is a very elastic term. And the synodical epistle expressly directs the pilgrims to intercede for those faithful bishops and priests "who in Germany and Switzerland are gloriously striving against the tyranny of unbelievers and the wickedness of destroyers," which is another way of praying that the unbelievers and destroyers may be suppressed. However, we will not speculate further on the nature or possible results of the pilgrims' prayers. We sincerely hope they will all reach home again safe in life and limb—which at this season of daily railway smashes is a blessing not lightly to be esteemed—and with no worse penance than is involved in the fatigue of a three days' journey. It would be unkind to wish them to return sadder, and it would be too sanguine, we fear, to expect them to return wiser, men.

MAN AND HIS NAMES.

IN Mr. Gladstone's *Homeric Studies* there is a dissertation on the important part played in Homer's story by the enclitic *τις*, and on the fact that that active but shadowy personage is purely Achaian and nowhere makes his appearance on the Trojan side. The *τις* of the Achaian army represents a busy and often plain-spoken public opinion, and the inference seems to be that in Ilios public opinion had not reached an equal stage of growth. *Τις* is in short the ordinary man, in no way distinguished from his fellow-men of his own time and place, having so little characteristic about him that he is not, even dramatically, provided with a name. Give him a name, be it ever so colourless, such a name as Caius or Titius, John Doe or Richard Roe, and you at once distinguish him, you give him a personality distinct from that of other human beings, and an active imagination may begin to clothe him with attributes of his own such as every Caius and Titius among us must of necessity have. *Τις* is man in the abstract—that is, the abstract, if there be any, of that particular time and place—and he utters the thoughts which are supposed to come into the head, not of this or that man wiser or more foolish than those about him, but of the average man as we find him in the society with which we are for the time concerned.

The *τις* in its Homeric use is very emphatic and very useful, and the formula is one which is hardly made the most of in later Greek. Still the Greek *τις* is not equal in vigour and clearness to the analogous Teutonic idiom, one which still flourishes in High-Dutch, and the dropping of which out of our own tongue is one of the sad losses which our ancient speech has suffered. Instead of *τις* we have *man* himself, not this or that man, not a multitude of men, but man nameless, impersonal, abstract—thinking, speaking, acting, purely as man, uninfluenced by the personal peculiarities of any particular member of the species. "Man sajt"; the phrase is one of the most perfect to be found in the range of human speech, and at first sight it seems unaccountable that any tongue which, like our own, once had it could ever have let it go. The truth is that we have not so much lost it as exchanged it for a formula in another tongue which historically translates it, though no one, in using it, remembers that the two have anything to do with one another. We will not pronounce dogmatically as to the exact relation between the English *one*, when it is used instead of *man* in such a phrase as "one says," and the French *on*. It is one of those cases in which a word has two origins. Professor Max Müller says that a word can no more have two roots than a child can have two mothers. As a matter of philological science, this is an undoubted truth. No word can have two roots. But some particular form or use of a word may owe its origin to the combination of two influences in such equal degrees that we must practically assign it to the two conjointly, and not to either by itself. When for "man says" we say "one says," *one* is either the French *on*, that is *homo*, transplanted bodily, with a mere accidental likeness to the English numeral *one*, or else it is simply the English numeral *one*, employed in a special use, which may perhaps have been influenced by the use of a French phrase of nearly the same sound. Philologically it must be one or the other; the word cannot have two roots; it must be either Latin *homo*, perhaps influenced in its use by English *on*, or else it must be English *on*, perhaps influenced in its use by Latin

homo. It can have only one mother, though its habits, and even its look, may have been greatly influenced by its nurse. Mr. Earle says that it is a peculiar use of the numeral, influenced by the French idiom. But when Bishop Godwin so often wrote "saith on," he may have been quite innocent of any theory about *on* and *homo*, but he must have meant to use a word which was quite distinct from the numeral. Historically the two sources have run together. No one could ever have used the numeral *one* for *man*, except with the French *on* sounding in his ears. On the other hand, if *one* for *man* really is the French *on*, its use has been constantly affected by the existence of the numeral *one* side by side of it. Philologically it is a most important difference, historically it is much the same thing, whether French *on* itself displaced *man* or stirred up English *one* to displace it.

On the evils of this displacement Mr. Earle has been eloquent, and not without reason. No other word can make up for the indefinite *man*. We use *one*, but we do not use it exactly like *man* or *on*; the notion of the numeral hangs about it, and it gets stronger as the connexion—of whatever kind—with *on* has gradually been forgotten. Then we use *you*, *they*, every kind of awkward shift; and we use *one* as what Mr. Earle happily calls "a veiled Ego," in a way in which we could hardly use *on* or *man*. Anybody who is used to *man* either in modern German or in Old-English grievously feels how much we have lost in clearness and often in strength of expression. But for our purpose we must take *one* as the substitute—however imperfect—of *man*, and as withal, if not the child, at least the client, of *on*. Now did the people who made the change, do ordinary speakers or learners of French then or now, know what the change really was? We suspect that it is only real scholars, or those whose French studies have been simplified by the help of M. Brachet, who take in the fact that the French idiom is simply a translation of the German, that *on* is *homo*, and that "on dit," "homo dicit," merely translates "man sagt." Now this must surely be one of the cases of direct Teutonic influence in French. As in several other phrases, the German idiom was translated. A Frank trying to talk Latin must have said "homo dicit," almost like the probably mythical Englishman who talked about "jamais esprit." The phrase became French; as its origin was forgotten, *homo* and *on*, substantive *homo* and indefinite *homo*, parted company, while the distinction between *Mann* and *man* never became so wide that there could be the least doubt as to their being the same. But meanwhile the idiom which from German had become French came over to England in the mouths of her French-speaking conquerors, and there, as we have said, either itself displaced *man* or taught *one* to displace it. Thus the original Teutonic phrase has been turned out by a dog-Latin translation of itself, which first became good French, and then at least helped to produce a piece of somewhat awkward English.

The process is not unlike that by which several good Teutonic names have come in among us under a French guise—the word *guise* by the way is itself an example of the process. But it is also part of the queer history of the word *man* and the words which answer to it. The indefinite *man*, the indefinite *homo*, is an instructive relic of the times when *man* and *homo* had nothing to do with sex. Every one who writes English must sometimes feel how much we lose from not being able to make the distinction which can be so clearly made in Greek and in Latin between *άνθρωπος* and *homo*, the common name of the species, and *άνηρ* and *vir*, the special name of the adult male. The strange thing is that most languages seem to have originally drawn this distinction, and to have taken a perverted pleasure in wiping it out. We know perfectly well that *άνθρωπος* and *homo* mean the species in general without respect to sex or age; we are used to *άνθρωποι* and *homines* in the plural to express human beings in general; but when we get into the singular, the application of *άνθρωπος* or *homo* to an individual male person is common enough, while its application to an individual woman is rare, and always strikes the reader as odd. When Phyc, in the guise of Athens, brings back Peisistratos we read that the people *παύσαντες την γυναικα ελθαι ανηρα την θεον, προεβουον τε την ανθρωπον*. But he would hardly have spoken of a woman as *η ανθρωπος* without some such special reason. The feminine use of the word in fact is one of those usages which come often enough to assure us that they are quite correct, but which never become quite familiar. We may say the same of the Latin *homo*; but here the case is stronger; not only has French usage got rid of *vir* and made *homo* take its place, but when Plautus talks of "mi homo et mea mulier," we can see that this usage, like so many other Romance usages, comes from the vulgar Latin of an earlier time. Still there is a slight shade of distinction. Nothing is more common in all languages than for the names which express the two sexes to get the special meaning of the relation of the sexes in marriage. Thus we speak of "man and wife," and not only that, but we forget that *wife* of itself simply means *woman*, without reference to marriage. So we have in Greek *άνηρ* and *γυνή*, and so in Latin *vir*, though neither *femina* nor *mulier* is ever used so distinctly and habitually to mean *wife* as *γυνή* is in Greek. In French, on the other hand, *femina*, and in Italian *mulier*, have become the regular words for wife. The French husband calls his wife *ma femme*, but *vir* has died out of the language, and *homo* has not so thoroughly taken its place as to be used in this special sense; so she has to fall back on the more formal description of *maritus*. The German wife on the other hand can say *mein Mann*, but in English we never use *man* in this sense, save in the single phrase of "man and wife." Then, while *wife* has come exclusively to express marriage, the male conjur has come to be called by a name which has nothing specially to do with marriage

at all. The husband is of course the husband of his wife, but simply because she is one of the members of his house, one of those who are under his *mund* or *poteas*.

All these cases are among the oddest caprices of language. In none of them is there any difficulty in following the idea of each change; the difficulty is to see why what happened in one language should not have happened in another. Why should *femina*, for instance, have become so prominent in French and be so behindhand in Italian? Why should *mulier*, *moultin*, have so utterly died out in French? Why should the actual usage of the English *wife* and the High-Dutch *weib* be so different? We know of course that accidents will happen even in the best regulated languages; but there seems to be a special crop of them everywhere among words of this particular class. In our own tongue we have thankfully cast away as perfect a set of distinctions as any tongue could wish for. What could be better than *mann* as the species, with the sexes distinguished as *carlmann* and *wifmann*? Yet here again there is a difference. The *carlmann* is distinguished, like the *carl-catt*—a *tom-catt* there could hardly be in our Teutonic island till the appearance of Thomas of Bayeux in 1070—or as the cock is the *carl-fugel*. But the hen is no *wif-fugel*, though Lucian calls mares *τας τών ιππων γυναικας*, and though there is a *carl-fugel*, as there still is a *queen-bee*. To be sure, we once had *vir* in the form of *wer*; but then its cognates went off to mean *homines* in general, for Cantwarabyrig was not dwelled in by *carlmen* only. And to go back to Latin, what meaning did mediæval writers attach to the word *virago*? We understand the name as applied to heroines and female rulers like Æthelfleda and Adela of Blois, "laudata potentius virago"; but why was Bertrada—Fulk and Philip's Bertrada—"tenera adhuc virago," when she had as yet done neither good nor evil? And, to make matters harder still, we get faint glimpses of *vara*, feminine of *vir*.

Then there comes another use of the word *man* and of some of its cognates, to express inferiority of some kind. Thus we have *man*, *homo*, opposed to *hlaford*, *dominus*, we will not say to express *vassal*, as here at least *man* is the older name. In the second volume of Domesday mention is made of a man who had "duas suas mulieres." We know a copy in which a former owner has thought good to denounce the bigness in the margin; but we suspect that nothing more is meant than two female vassals, nothing more than when we read elsewhere of "Eddeva puella, homo Stigandi archiepiscopi." From this sense of *homo*, going somewhat lower, we get "Mr. So-and-So's man." So we hear of "officers and men," and more oddly, in one passage of Livy and one of Cæsar, of *homines* in the sense of foot-soldiers, as opposed to the more dignified horsemen. Then at Oxford the population of the University and city is or was—we speak with the reservation needful in speaking of all Oxford matters—divided into "Dons, men, and cads." How far *homo* in the mediæval sense comes in, how far "Don" answers to the *dominus* of which it is at least an indirect contraction, might be a knotty point. But here at least poor humanity is comforted by having something below itself. If the "man" has the "Don" above him, he at least has the "cad" below him. The *homo* of Domesday also had several classes below him, but they are not brought out in so marked an antithesis. The most exact parallel is the passage in Aristotle where *άνθρωπος* is distinguished from *θεός* on one hand and from *θηρ* on the other.

TOURISTS.

TOURISTS may be divided into two main classes—the social and the misanthropic. The Englishman is, generally speaking, flying from large cities, and is anxious to enjoy a few weeks of quiet repose unbelieved by his fellow-countrymen. In many foreign countries, on the other hand, the temporary stay at a bathing-place is regarded as a special opportunity for the enjoyment of society. The crowd which has for its pretext the desire of imbibing some spring of offensive taste and smell has for its real motive the desire of spending a few weeks in indolent gossiping and lounging, with perhaps some superadded excitement in the shape of gambling. Each of these modes of enjoyment is perfectly legitimate. Nobody can complain if a Londoner prefers a mountain solitude to Pall Mall during six weeks of the year; and, on the other hand, one can sympathize with the dull old country gentlemen who used to visit "the Bath" by way of rubbing off some of their domestic rust, or with the countless throngs at modern watering-places which seem to be impelled by an analogous motive. The people who, having bored each other for ten months at Paris or New York, rush to Baden or Saratoga in order to continue the process for the remainder of the year, act upon less obviously rational principles. However, they have their reward. They know what they want, and they get it, and let us hope that they can look back upon their holidays with a satisfied conscience. A cross division might again be made into the tourists who have some further object and those who merely desire a period of relaxation. Few people are able to do nothing as resolutely and systematically as could be desired; and, as a general rule, some desire for sport and adventure or antiquarian research has to be added to the simple desire for a holiday. And here, too, we have no desire to point out that one object is intrinsically superior to another. Let people take their holidays alone or in company; let them risk their necks on mountains, or investigate the working of political institutions, or examine mediæval remains, or simply lie on their backs and watch the advances and retreat of the tide. Which of these courses is the wisest must depend upon the cir-

circumstances of each individual, and a tolerant observer will be disposed to allow that there is room in this world for many different varieties of the tourist species. The more the habit of travelling spreads, the more desirable it is that there should be an ample choice of different modes of amusement to gratify different tastes.

No long, then, as a tourist has some distinct end in view, and so long as that end is not distinctly immoral, we shall be little disposed to quarrel with him. It is as well that most people should put their holidays to serious use, and collect the materials for blue-books in their leisure hours; only let them not look down with too much scorn upon their humbler brethren who are seeking for pure amusement, and are content to recruit their energies by a wise passivity. But there is one, and unfortunately it is a very large, if not the largest, class of tourists to whom we cannot quite extend the same amount of approval. We refer to the countless multitudes who travel for the sake of travelling, or, to speak more accurately, without any distinct aim beyond that of imitating their neighbours. They have not distinctly made up their minds whether they want solitude or society, and they hit upon a most unfortunate compromise by travelling in crowds, and yet travelling unsocially. They throng the ordinary centres of amusement and stare at each other, day after day, in gloomy silence. They tread on each other's toes, but never speak, and each unit of the mass regards every other unit as a sportsman looks upon a rival on his own hunting-ground. They see the established sights, but they never take sufficient interest in them to understand their real charms. They pass a fortnight in the Alps, and do not even learn the difference between a glacier and a snow-field; they look into half a dozen churches on their way home, and do not discover in what respects the Madeleine differs from Notre Dame; and they cross Europe without knowing whether they are in a Republic, an Empire, or a good old-fashioned Monarchy. It is only too easy to ridicule these unfortunates, and it is a good deal harder than one could wish not to lose one's temper with them. They are undoubtedly very disagreeable companions in many ways. They raise prices, they fill steamboats, and they are always getting upon more refined sensibilities by the misplaced and unintelligent enthusiasm which is more vexatious than honest indifference. Still we would rather, if possible, find out in what respects they deserve commendation; and it may be frankly admitted that at any rate they increase the facilities of travel. It has not hitherto been our fortune, and we cannot honestly say that we much desire that it may happen to us in future, to travel in one of the caravans conducted by Mr. Cook in person. But it would be unjust to a man of practical genius not to admit that he has done something towards organizing the means of locomotion, and making easier the merely mechanical part of a traveller's arrangements. And, again, we may admit that the domestic tourist is frequently an amiable and, for a time, an amusing companion. The American, for example, of common life, who does Europe in three weeks, has faults which have been sufficiently indicated by innumerable satirists, some of them of home growth. But with all his weaknesses, there is a certain *marc* about him which is not unattractive. The absolute simplicity with which he confesses to a depth of ignorance which an equally ignorant Englishman would endeavour to varnish over with guide-book phrases or to hide by a sulkily silence, the imperturbable calmness with which he ignores foreign regulations, and sometimes forces his way where more sensitive persons would be rebuffed—these are qualities, not, it may be, deserving of unqualified admiration, but still indicative of the national energy and shrewdness, and therefore not to be too quickly despised. For our own ordinary fellow-countryman, who follows the tourist track with sheeplike docility, and renders his indiscriminate homage to the noblest beauties of art or the most wrecked gimcracks with the same vacant stare, we feel an emotion rather of pity than of dislike. We would, if possible, avoid his society, but we would endeavour to meet him with kindness, and, if possible, to lead him into a better path. The causes of the recent development of tourism of this dismal variety are sufficiently obvious to need no investigation. We merely desire to point out to him some of the mischiefs which he occasions, and to suggest a simple rule or two for his better guidance.

To say to such a tourist that he is offensive to his fellow-travellers would probably make very little impression upon him. He would simply be insulted, and reply that his fellow-travellers were offensive to him. To declare that he had not really enjoyed himself, that he had been bewildered rather than amused, and had turned what ought to be a period of recreation into a period of fussy fatigue, might be true, but would hardly be convincing. We carry our self-esteem into our pleasures; and most men would more easily be persuaded that they had discharged their serious duties ineffectually than that they had not enjoyed themselves to the uttermost. We may, however, briefly remark upon the mischief which such persons do to the country in which they come. The tourist of this kind is the natural prey of the persons amongst whom he travels, or, in other words, he stimulates their tendencies to avarice and deceit. The effect upon any district which becomes thoroughly tourist-ridden is melancholy to those who remember it in better days. An Alpine valley, for example, used to be inhabited by a thrifty and industrious race of fairly intelligent peasants. When the first travellers began to penetrate its fastnesses, they produced what was in many respects a useful stimulus. The guides learnt to climb, and not only learnt to climb, but frequently to take an intelligent interest in the natural history of their district. Many of the older generations of Chamouni guides, for example, were men of remark-

able education for their class, and knew something of the flora and of the geology of their mountains. Roads were made and money came in, and the people profited by some of the advantages of civilization. But the influence of the race of galloping tourists has been almost exclusively deleterious. They required no particular intelligence or skill in their guides, for any man who could walk an hour or two up-hill could show them all they wished to learn. Consequently, the old race of guide is rapidly being supplanted by a set of idle loafers whose only qualification is impertinence. Being able to pick up enough from a few customers to support themselves during the summer, they spend their time in lounging about inns and drinking-places. Drunkenness increases rapidly, and begging naturally follows. The tourist is glad to buy off anybody who bothers him sufficiently, and the most indiscriminate form of charity is naturally practised by strangers who go through a district at the gallop. On entering a village you give a few sous to a screaming orphan; half-way through you bestow a few more on the orphan's widowed mother; and on leaving it you contribute to the wants of the sorrowing widower whose wife and child have just loved an aid from you. All manner of ingenious devices are used for extracting funds from the thoughtless and hasty traveller. His guide takes him to an inn, and the inn shows its gratitude by allowing the guide a gratuitous dinner, the stranger's bill of course being proportionally increased; and it is a fact that not long ago at a well-known town the proprietors of some rival diligences were forced to pay nearly half the ostensible fares to the guides who brought them their prey. In short, the tourist season is the harvest-time during which the natives levy blackmail upon their guests by a thousand ingenious devices, and manage frequently to lay up enough spoil to support them during the remainder of the year. It is not surprising, though it is a melancholy fact, that there are villages which a generation back were inhabited by a really fine population, which are now in great part a mere nest of tourists' parasites, living partly on downright cheating and extortion, partly on more or less disguised begging, and spending a large part of their ill-gotten gains in drink. Such evils are merely a natural result of the current of ignorant and thoughtless people which flows through a district without staying long enough to realize the effect of their conduct, and who are entirely dependent on the services of guides, hotel keepers, carriers, and a whole race of miscellaneous hangers-on. By such means a district may be thoroughly demoralized, and may be led to give up honest means of making a livelihood for the chances of a speculative trade upon the credulity of tourists.

Perhaps the evil may in time bring about a remedy, and the trade of supplying the wants of tourists may become a recognized pursuit, with a code of morality of its own. Meanwhile nobody who has observed the process in any given place can doubt the reality and extent of the evil. We must be content at present to draw a moral for tourists, who are generally quite ignorant of the mischief they inflict. It is simply that travelling should impose a certain responsibility on the traveller. To dash through a country throwing away money right and left in utter ignorance of the people is really to commit an offence against well-understood principles of political economy. Every tourist ought to have a hobby; any pursuit which fixes him to a particular line of activity forces him gradually to make some real acquaintance with the people amongst whom it takes him. He gets to understand something of their ways of life, to distinguish between the knaves and the honest men, and to be capable of guarding himself against mere imposition. It matters little whether his object be directly to study politics or trade, to advance science, or simply to amuse himself with some genuine sport. He is forced, even in the last case, to make himself really acquainted with the good and bad qualities of the people amongst whom he is placed; for the greatest pleasures, even of a sport, are those incidental pleasures which result from a close familiarity with scenery and with the inhabitants of the district. Mountain-climbing is a trivial pursuit enough; but it brings with it a knowledge of the guides, frequently indeed a foolish admiration of particular heroes, and not unfrequently, it is to be feared, a tendency to spoil them. But at any rate it becomes a matter of real importance to encourage the daring, the skilful, and the honest, and not to give away money thoughtlessly to the first wordy impostor who catches you at the inn-door. And therefore the tourist who fixes himself to the pursuit of a hobby is, as a general rule, not merely a happier man, but is in much less danger of demoralizing the various persons who contribute to his enjoyment. To select your hobby wisely is indeed one of the great problems of life; and happy are those who can choose a good wearing animal of sound constitution, and not likely to inflict mischief upon any one either by direct or collateral results.

THE BRITISH ALFIUS.

ENGLISHMEN, as Lord Derby has been telling us, are by habit, tradition, and temperament an outdoor people, and their dreams of happiness turn naturally towards the country. "Beatus ille qui procul negotiis"—"Blessed is the man who has retired from business." The condition antecedent to the Horatian beatitude is much the same in the case of our modern Alfius of the London or Liverpool Exchange. He has not the slightest sympathy with the doctrine of "virtus parvo bene," and although "he has much delight" if on his "tabula spoons are bright which his father left him," by reason of the antiquity of

their Hall-mark, he means to exhibit a much more imposing array of plate on his sideboard, and he translates "*mensa tennis*" by "*dining à la russe*." Accordingly, his reading of the "*solutus omni fenoze*," if he has been lucky enough to light on Mr. Baring's attractive little volume, goes somewhat beyond the literal and primary sense of having "never a bill to face," and includes a pleasant sum in six figures protected by safe investments, with the last half-year's dividends in hand at his bankers. Private fortunes in our time advance, like national revenue, "in bounds," receding perhaps not unfrequently in the same fashion; and a lucky saucy may in half-a-dozen years bring Alfius face to face with the realization of his dreams by roads more respectable than those trodden by his predecessor, frequented now by Sir Mulberry Hawk and his pigeons, and paved with sixty per cent. The "paternal acres" most likely have no existence in his case, according to the strict acceptance of the phrase; but somewhere or other within the four seas there are "acres" which may with pardonable latitude be so described, and which chance to be in the market. Most City men, as well as other Londoners who do not aspire to that title, manage to consider themselves as belonging to some "county." The name which blazes in gilt letters on an Oxford Street shop-front, and stares you in the face from every boarding and in every second-class carriage, is sure to be found crumbling into illegibility on some grey stone in a country churchyard; and if Alfius himself was not born in those parts, he remembers having seen them when he was sent down on a visit to his grandmother after the measles. He has a habit of looking down the inside pages of the *Times* Supplement in a dreamy, purposeless sort of way, and at length his fate meets him there. "The Grange" is to be sold in the next parish down in his country; a very desirable residence, as the auctioneer avers, and as he entirely believes; for did not the apricots of old look tempting in their golden glow on the fruit-garden wall, and was not the surreptitious perch which he looked without a rod "in the lower pool" a very prize for a fisherman? And this delicious and envied possession is to be had almost for the asking; for the money is all ready, and really there is no trouble in the matter, not even so much as the packing of a carpet-bag and a couple of nights in a country inn. He has just to drop casually in at the auction rooms up a quiet yard behind the Bank, and the thing is done in half an hour. He will of course do nothing in a hurry, and so he provides himself some days beforehand with the auctioneer's catalogue and particulars of sale. That "description of lots" finishes him. He expected to get a shabby little bundle of stitched pages which he could stuff into a side pocket; he receives instead a gorgeous folio in an embossed cover, containing an engraving worthy of the Art Union as a frontispiece, and a sort of county history which indirectly shows it to be a forgone conclusion that the Lord of the Manor of Westdown must be High Sheriff in about four or five years, and may carry his division of the county, if he chooses, in a couple of Parliaments or so. There is, indeed, at the close of the volume a sort of appendix divided into lots containing many fields with queer names and of varying acreage; but these are details of which the auctioneer takes no heed, nor does he, and he comes home one evening to dinner a little behind time, and mentions to his wife, as he uncovers a basket of special fruit from Garcia's, that he "has bought the Westdown property down at home, you know, in Leamshire, for almost no price at all." He is, in fact, rather pleased with his luck, for he was prepared to go a couple of thousands higher if it had been wanted; and a pleasant *à-la-tête* evening passes away over the fruit in planning for the cows and the poultry in the market town, and how he means to exhibit at the flower-show in the market town, and grow his own melons and cucumbers. It is scarcely necessary to say that Alfius has no daughters. By this proposition it is not meant that he is not blessed with children who possess "*propria femineum referentia nomina sexum*"; on the contrary, much of the domestic felicitations will have turned on the thought that "the country will be so jolly" or "so sweet" "for the little girls;" but that these have not arrived at the age which entitles a man to talk of "my daughters," and which brings all his proceedings to the test of what "the girls"—not "my little girls" any larger—may be pleased to say or think about them. "My little girls" are unfledged divinities who have not as yet grown the wings which "my daughters" will spread over papa to protect him from a difficulty, or will spread perhaps on their own account, with slightly differing consequences.

We will ask our readers to assume the furniture vans, of which they certainly know the artistic representation, and possibly the less glowing reality, and to consider Alfius as fairly "in the country." There are two ways of being in the country—the one, when you can get out of it again; the other, when you cannot. The former of these conditions is always that which is assumed by the City man in his visions of a country life. The actual circumstances in which he lives underlie his waking dreams. The ideal country is not disconnected from railways, shops, telegrams, and second editions, as in actual experience it may be found; and when Alfius has dissolved his partnership or sold his business, and generally got clear of the office or the counting-house, and has fairly turned over a new page of his life, he will probably find much unexpected matter there written for his perusal.

Westdown is certainly a charming place, with the finest scenery in the kingdom—when you get there. Half the watersheds in England can be seen from the terrace, and if you want to include all the horizon in one map you must paper the hall with Ordnance Sheets. As an accident of this "commanding position," it proves to be fifteen miles from anywhere, and the local market town is

shown in Bardsley's map as central to an area of virgin white traversed by a dotted line, representing a railway "in progress"—since about 1845. There are excellent turnpike roads, amply supplied with turnpikes, upon which, when Alfius was a boy, opposition fast coaches ran; but the coaches were taken off when the railway was projected, and the public conveyances now consist of a carrier who goes to the county town once a week sometimes, but who has had luck with his horses. The residents in the neighbourhood vie with each other in friendliness and hospitality to the new comer; but as the surface of the country bears a general resemblance to the picture of the comparative height of mountains on a National School map, it is not so easy to get about, and the series of gates, which obviate the necessity of hedges on the cross roads, are trying as you drive home from a dinner party on a dark night. But the nights are not dark in the summer, and even a good heavy clay makes a decent road enough if there has been no rain for a week. The great national institution of croquet, therefore, flourishes around Westdown with unusual vitality, and there is nothing like croquet for becoming easily acquainted with one's neighbours. The game offers such endless scope for casual conversation, which you are never bored by being obliged to keep up for many minutes consecutively; and a croquet party about Westdown has a peculiar charm for Alfius, because half the girls are daughters or cousins of old family acquaintances, and as he knows something about everybody there, he can pick up and piece together all sorts of threads of delightful old associations. He had better try. His inexperience will indeed be provisionally pardoned; but feminine intuition will secure him some excellent advice from his wife in the drive home. For croquet has three stages, and the Westdown country has long passed the first of them, though happily it has not arrived at the third. In this last a croquet "match" is an "event" to be chronicled in the sporting papers with the freest criticisms on a young lady's "form," after the fashion in which the points of a horse are canvassed. In its earliest stage, now a thing of history, except in the first efforts of the nursery, croquet was merely an amusement. Westdown croquet is in the intermediate stage, and is a scientific solemnity. A game of croquet is thus a function to be observed with due ritual, and by no means to be interrupted by secular and discordant strains; and the members of a croquet party are each and all

Doctus et Placidi chorus et Digne
Decore ludens.

You must talk, accordingly, nothing but the proper talk about "taking two off" and the like; which may be rather difficult in your probable ignorance of the terminology of the science, and in the degree of proficiency in the art which is represented by your sticking permanently at the third hoop, after getting through the first by a fluke, and being charitably driven by your partner through the second.

But if the City man finds himself in something like the position of a fish out of water outside the limits of his newly acquired domain, he is at any rate lord and ruler within them, and will find there the fruition of his desired dignity and repose. The "ancient mansion," with its "gardens" and its "luxuriant shrubberies," the "park with its stately timber" and its "romantic chain of lakes abounding in fish and waterfowl," will be all that his fancy painted them, and will compensate for what he must allow to be the comparative seclusion of his residence. But the chain of lakes turns out to be rather a delusion. This "striking natural feature in the landscape" has resulted from the process of damming up a small watercourse at irregular intervals, and after a few years of picturesque neglect the tail and sides of every pool in the series have become a forest of bulrushes and reeds, and its head a tangle of waterlilies and pondweed. There are plenty of waterfowl, but they are never in sight; the fish lie peaceably out of reach among the stems of the water-plants, and there is not a square yard of water into which a line can be cast, or of bank clear enough to cast it from. The "luxuriant shrubberies" are in much the same plight, and the cool air of their secluded walks suggests alternately the idea of a tunnel and that of a coffin; the ivied gables are the chosen abode of countless bats and earwigs, and the "calm decay" of everything around acts as anything but a "lulling spell" upon the soul of the proprietor. And then, the drains; but no need to speak of them—of course the drains are out of order. It was never so in the good old times. Or was it that people were less particular in those days? Anyhow, no gentleman when "England was merry England" was ever known to be troubled with his drains. Not a single reference to this modern affliction is to be met with in any of the authorities, from Chaucer and Shakespeare downwards. Cloacina is a patient goddess, but apt to be revengeful if her ancient cultus is disturbed; and she has been very vindictive of late years. The passion for reform has left nothing untouched or uninspected, and the consequences are what we see.

But domestic life in the country must retain, at any rate, its old primitive simplicity. All ranks and orders of men are represented in the village community, and all meet on neighbourly and familiar terms, every one falling into his proper place. The saddler does not boast of his little box at Hendon; the grocer does not drive his pair of horses at Norwood, nor the butcher give champagne breakfasts in Pipping Forest. Everybody touches his hat to everybody else with a respectful, or a condescending, grace. This is very nice, and so different from what Alfius has been told by his wife, and has found from the newspapers, to be the fashion of London tradesmen. He means to dispense his patronage in the

way of custom liberally among such deserving neighbours. This goes on pleasantly enough for a couple of months or so, till one morning a butcher's boy brings a note from his master to the effect that "Mr. Brisket has been informed that Alfus purchases a portion of his meat at Olaybourne, and he must decline in future to supply the house at all unless he has the whole of the custom." The City man begins to think after two or three similar experiences that human nature is pretty much the same everywhere; and a faint suspicion dawns and gradually grows upon him that perhaps he would have done more wisely to remain in the position to which he had become accustomed, and among the people to whom he was known. He discovers that twenty or thirty years of any kind of life wear a tolerably deep groove, out of which it is not easy to get, and that he does not readily fit himself into another groove which he has not himself worn. It is the old story of his Horatian prototype over again, in a new dress:

Omnem redogit Idibus pecuniam,
Quærit Calendis ponere;

only with rather a longer interval. But the end comes in time. "My little girls" have grown into "my daughters," and they have pronounced "this sort of thing awfully slow, you know." Mamma has been gently throwing out hints from time to time, first about "masters for the girls," and then about "prospects"; seaside visits have been extended, the last year or two, to a disproportionate length, and a very proportionate expense; till at last the decision is made; Westdown Grange and its park are heard of in Tokenhouse Yard again, and its late proprietor, "futura rusticus" and Sheriff-designate no more, is off with his belongings to South Kensington.

COOLIES IN THE WEST INDIES.

A SUBJECT of permanent interest gains fresh statistical illustration from the last Report of the Emigration Commissioners. It is the system by which a swarm of Asiatic labourers is yearly transferred from the populous countries of India and China to the sugar-growing estates of British proprietors in the West Indies. After the descriptions of coolie life in Trinidad and Demerara furnished by such popular writers as Canon Kingsley and the author of *Ginx's Baby*, this dose of dry official statement is a help to digestion. Mr. Jenkins indeed, though sent to British Guiana by the Anti-Slavery and Aborigines Protection Societies, performed his task of reporting not unfairly. The author of *At Last*, for his part, having enjoyed his Christmas holiday in the tropical paradise of a romantic naturalist, was in a very good humour with his hosts in Trinidad. He was glad to believe and declare, on the whole, that the coolies were very happy in being protected by wise and benevolent laws, enforced with serene impartiality against possible ill-usage on the part of the planters. If ever they were hardly treated, it was by swindling usurers of their own nation, who would follow them all the way from Calcutta or Canton to cheat them out of their wages. The general conclusion, too, of Mr. Jenkins, from his personal observations, added to the evidence got by the Royal Commission of Inquiry three years ago, was decidedly in favour of coolie immigration; but he found serious fault with the colonial laws and magistracy as failing to protect those poor people. It deserves remark that in the course of last year measures have been adopted both in British Guiana and in Trinidad to improve the condition of labourers sent from the East Indies, and this has been done at the request of the Indian Government. At the same time, while the British authorities in Asia join hands with those of our possessions in the American Archipelago in a strenuous effort to perfect this system for the common benefit of their respective subjects, the Chinese Empire has lately refused to contribute labourers for our West Indies. The entire operation is therefore now assuming more completely and exclusively the character of a grand imperial transaction conducted by this kingdom and its dependencies in the East and West. If the splendid dream of a Federal Empire, with a legislative assembly of delegates from all its colonies or provinces, could ever be realized, this business would devolve upon such a Congress and its executive power. The resources and opportunities of the whole Empire, including all that belongs to India, as well as Australasia, South Africa, and the British dominions in America and the neighbouring islands, would probably suffice for the adjustment of useful labour to every field. But the Chinese industrial element is worth having where it can be obtained; our West Indies would be glad to get some more of it, and so would Queensland, if not also, as we suspect, the Northern provinces of New Zealand. It prefers to flow without artificial contrivance in the direction of California across the Pacific Ocean, so that our sugar planters in the isles and on the shores of the Atlantic must at present look to India for the hands they need to supplement those of the African race.

This remark seems to open a wide view of political and moral consequences in the remote future, but we are not here called upon to utter a prophecy. Confining our notice to the facts mentioned by the Emigration Commissioners, it is agreeable to be told that they have found the relations between employers and labourers not unsatisfactory. Complaints of ill-treatment were fewer last year than before, and the rate of mortality among Indians passing their first or second year in the Western world shows a better chance of healthy life for them when once they get over the voyage. But the proportion of deaths on the voyage has been greater than usual, which is ascribed partly to the effect of a season of dearth in India, causing the shipment of half-starved and emaciated wretches, partly to the

delay of sailing-vessels by adverse winds in the Bay of Bengal, so that they meet cold weather at the Cape. One ship is mentioned as having occupied 163 days in her crawl from Calcutta to Jamaica. To provide against this difficulty, the experiment has now been tried of using steamers, both to fetch the coolies from India and to carry them back at the end of their service. It proved quite successful in the trip of the *Enmore* from British Guiana to Calcutta with 661 returning Hindoos, and her homeward voyage to George Town with 562 Bengal emigrants, between September and the end of the year. The distance was traversed in fifty-six days going one way, and fifty days the other, with the loss of but one life, overlooking a case of suicide and the accidental death of a baby. The Commissioners think much of the advantages to be gained by employing steamers, which are well worth the increased expense. The passengers enjoy better health, not merely because they are kept a shorter time on board, but also from the constant speed of the ship promoting ventilation. They are spared the mental depression naturally occasioned by a slow and uncertain voyage, with forebodings of hopeless banishment. To compensate for an additional cost of freight, the human cargo by steamer is landed in prime condition, fit to be at once assigned to the planters' estates, instead of being sent into the hospital. The saving of coolies' food on board ship is another advantage of lessening the time occupied in their conveyance.

The population statistics of British Guiana and Trinidad more especially present to view a large admixture of the Asiatic races. At the beginning of last year there were in the first-named colony 42,763 Indians and 5,847 Chinese, while in Trinidad there were 27,425 Indians, of whom 4,545 were born in the colony. In Jamaica, at the end of last year, there were nearly 11,000. The colonial Governments wish to keep these people as settlers after the expiration of their term under the indentures. Trinidad and Jamaica offer them ten acres of land or a bounty of 12*l.* to stay in the island. This offer is accepted by the majority of those entitled to a free passage home when they have lived there ten years, serving five years under their bond, and working the next five years in freedom. British Guiana would invite the continued residence of acclimatized foreigners there by an offer of the same kind. But its whole territory is little else than a mudbank intersected by the tidal water-courses at the outlets of three neighbouring rivers; the fertile soil is reclaimed by a set of embankments and canal sluices at an enormous cost, and there is really no dry land to bestow on peasant freeholders. The coolies who return to India or China have usually contrived to save a moderate sum of money, averaging about 40*l.* in Guiana and 63*l.* in Trinidad, besides the silver anklets, gold rings, and other jewelry worn by Hindoo women. It is significant of their rage for saving that the deaths among them in Trinidad were much more frequent when they were allowed to buy their own food than since the employer has had to provide daily rations with a deduction of sixpence a day from their wages. Indentured labourers cannot, of course, be indulged with liberty to starve themselves, and to lose what natural strength they may bring to their contract service. Even at his best, and when properly fed, the average Indian coolie is quite unable to work as the more robust negro might do if he were not so lazy. This difference of bodily powers between the several races of labourers has led to mischievous deceptions practised on the industrial recruits in India with regard to the wages they may expect to earn. Some very gross instances of such practices which incurred the censure of the Royal Commissioners were related by Mr. Jenkins in his book, *The Coolie; his Rights and Wrongs*. Recruiting agents or touters in India for emigration to the West Indies used to give their dupes a certificate of their engagement, on which was printed a marginal statement of the highest rate of wages that the ablest class of men could possibly obtain in Demerara. This document was commonly mistaken by the poor Hindoo for an official contract to pay him at the same rate. But the authorities of British Guiana, and their constituents the planters, had no intention to promise him anything more than what his labour might happen to be worth; and they would make no contract with him until his arrival in the colony. They do not seem to have been cognizant of the unwarrantable acts of some of their agents in India, and it is to be hoped that the business will henceforth be more honestly conducted there. Indeed, an ordinance of the colonial Legislature has already been passed for authorizing their Calcutta representative to make specific contracts with the Indian emigrants before their departure from home; and they have also fixed a minimum rate of wages. These provisions will be incorporated in a general Act now under discussion in the Court of Policy, by which the whole system in and for British Guiana will be amended. Some minor improvements, besides the prescription of a minimum of wages, are found needful even in Trinidad, where Canon Kingsley saw much to be praised. In Jamaica, under the beneficent rule of a Governor whose previous acquaintance with India had eminently qualified him to dispose of this subject, the laws for the engagement and treatment of Indian immigrants are fairly administered, giving satisfaction, we are told, both to the employer and to the employed.

Altogether, this Report, as we have observed, gives a favourable account of the system in the West Indies, notwithstanding the untoward incident of a coolie riot last October on a Demerara estate, where the police had to fire on the rioters and to kill five of them. Such things will happen now and then in the best regulated communities, though ever to be greatly deplored. In the case referred to by the Emigration Commissioners, it is said to

have been proved by an official inquiry that the coolies, who had gone out on strike as if they had been free labourers, and who threatened to kill the manager and overseers, and attacked the police when the ringleaders were arrested, had no actual grievances to resent. It would appear from a return sent by the Governor of British Guiana, if its figures may be taken as fairly representing the wages paid to coolies as well as to negroes working on estates, that the pay for heavier kinds of labour may range from 1s. 4d. to 3s. 10d. a day, and for the lighter tasks, such as women could do, from 1s. to 2s. 8d. But we do not understand that the coolies, while bound to service in the first five years of their life in the colony, are ever paid at the highest of these rates. The minimum fixed by a recent ordinance is 1s. 0½d., without distinction of sex, or difference for the sort of work to be done. In Trinidad, as we learn from a more precise report, the coolie not under indenture, but freely working for hire, gets 30 cents or 35 cents for a field task of five or six hours, while the coolie under indenture works an hour longer for 25 cents. The negro can do the same work in four or five hours, and may earn his 40 cents a day—in our money 1s. 8d.—by working eight or nine hours. This is not bad pay for common field-labourers in a country where sixpence a day will buy sufficient wholesome and nourishing food. Why the rate of wages in the neighbouring colony of Guiana should range from 1s. 4d. to 3s. 10d. is not explained by the Commissioners; but we may suppose that the 3s. 10d. is for some kind of skilled labour, which has nothing to do with coolie service in general. Taking, however, the lowest estimate of his remuneration, and bearing in mind that the coolie is provided with a cottage, or with a dwelling at least in barracks, that he is never cast out of employment, and that the planter maintains a private hospital to cure any who fall ill, we can but wish that the agricultural labourers of Great Britain were as well off. The truth seems to be that many of the emigrants, both from India and China, have been improperly selected, and were unfit for ordinary field labour in any country. This was more absurdly remarkable in some of those who came from China, amongst whom were townsmen professing a variety of trades, "priests and schoolmasters, and scribes, weavers, shoemakers, and beggars," as the Commissioners of Inquiry found in 1870, when they examined a fresh lot of these hopefuls just put ashore in Demerara. It was impossible to protect such misdirected people against the severe disappointment and the real hardship of their lot in the colony; and since the methods of obtaining a Chinese supply of labour were beyond the control of British authorities, it is just as well that the Chinese supply has been stopped.

The Indian supply, on the contrary, being under the immediate regulation of those entrusted with the welfare of Her Majesty's Asiatic subjects, ought to be made available for all British colonies in tropical regions which demand such industrial assistance, and which can afford to pay for it. This is an imperial question of importance far transcending the prospects of sugar cultivation in Demerara and the islands. There are other British territories, of greater extent and perhaps endowed with yet greater resources, mineral as well as agricultural, which are likely to require as many toiling hands as can be spared from Hindostan. In Mauritius, which is comparatively near, the Indian part of the population is 214,000, of whom 60,000 were born in that island of Indian parents. Ceylon also takes a share of this element of prosperity from the neighbouring mainland. Natal puts in its claim; and we expect that North Australia and Queensland will soon be heard of, as bidding for the same commodity of human instruments to develop their natural wealth. There is no apparent limit to the extension of this process, under a judicious and well-administered system of voluntary transportation. A Secretary of State for India and a Minister for the Colonies might lay their heads together, and find it a great opportunity for the best statesmanship. The excellent results in Jamaica of Sir J. P. Grant's rule there, since the removal of Mr. Eyre, afford a good omen of what might be done by more frequently bringing the trained official wisdom of British India to deal with the motley populations, aboriginal and imported, of many countries under British rule.

AMONG THE PARTRIDGES.

WHATEVER may become of the Game-laws, it will take a great deal of shooting to extirpate the partridges, and the very mildest law of trespass would preserve a good many of them, even were all England parcelled out into allotment patches. So long as our great proprietors add field to field and farm to farm, and so long as it pays us to grow our cereals instead of importing them, it is pretty certain that we shall have excellent partridge-shooting. While capital is being expended in reclaiming wastes, the partridges increase with cultivation everywhere. They manage to pick up a tolerable living even on the edges of barren moorland, between the heather and the coarse swamp grass, where the barley harvest comes off in the following spring and oats are reared as a delicate exotic; and if the "hill partridges" run small, the coveys are large and the birds are hardy. Indeed partridges seem to have tougher constitutions than the grouse, although they are bred in a milder climate, and amid much more effeminate surroundings. They are thinned by no such terrible epidemic as that which clears wide stretches of moorland in unlucky seasons like the present. About the worst that they can suffer from is a severe winter and a rainy spring, and it is true that these are sometimes

hard upon them. They are driven from the fields to take refuge in the stackyards, where they sit cowering under the stacks, so many ragged balls of ruffled feathers, and easy victims to the net or the gun. In the spring their eggs may be addled by incessant damp, or the little ones may come to an untimely end before they have well cleared the shells they are chipping. Or they may tumble into crevasses in the chalk country, and perish of slow starvation in their miserable prisons. But disasters of this kind are very partial after all, and, if one estate suffers severely, the next which is more sheltered may escape almost entirely. It is seldom even in England that it rains without intermission through all the spring months; and if the first sitting of eggs has come to grief, the persevering parents set to work at once upon a second. Then, although there are ostrich-like partridges who will drop their eggs close to any footpath in the open hayfields where any passer-by may stumble upon them, yet most of the birds are of more intelligent instincts and contrive to conceal their nests so as to defy any ordinary bird's-nester. If the shepherds choose to hunt the hills for them, they may find upon a grouse moor almost every one of the eggs that have escaped the sharper eyes of the blooded crows; and the rooks bereave many a maternal pheasant that haunts the covers commanded by the rookery. But nothing but a weasel or a hedgehog can come at a partridge-nest that is hidden away in the rank grasses among the tangled roots of a prickly-thorn hedge. Above all, partridges fill up a country as fast as you thin it down, and colonize outlying territories when their native breeding-grounds get overcrowded. Year after year you may bring every feather to bag on your own little bit of unprotected land; year after year the superfluous birds of your preserving neighbours will come over and people it for you again. Partridges are by no means shy beyond a certain point of prudent self-preservation; and though they will not exactly venture into the squares of a city like sparrows, yet so long as there is a patch of grain or a field of cabbages, they will not hesitate to settle in the suburbs. So, partridges being more or less plentiful everywhere, partridge-shooting will always be the sport of the middle-class sportsman, and where one heart is throbbing on the 11th of August, fifty will be in a flutter on the eve of the 1st of September.

This year there must have been much anxiety on the night before the 1st, and a good deal of disappointment on the long looked-for morning. Generally speaking there may have been no lack of birds, but then the weather left very much to desire. It is one thing turning out cheerfully after breakfast if you are old and experienced enough to have curbed up your enthusiasm for a ten o'clock start—turning out when the sun is shining brightly upon everything, and there is breeze enough to temper the warmth and assure you a fair scent. It is quite another matter to take your chance of fierce driving showers, and to face a wind that is blowing like half a hurricane. It is not only or chiefly that everything on the earth or in the air looks and feels inexplicably damp and dismal; that you must either be eternally slipping yourself and your gun in and out of your waterproof coverings, or else must shoot in a coat that clings in wet folds to your arms, and in knickerbockers that have changed to dripping waterskins; that each time you struggle through a hedge a douche of water drenches you inside the collar, and you go labouring over the heavy soil with some pounds of clay dragging on each of your shooting-boots. But your game is literally not worth the candle; the stronger birds are as wild as hawks, and even those that are weak on the wing are up and well under weigh while as yet you are a good couple of gunshots off. While still at the back of the hedge in the next enclosure you hear the whirr of the parent birds above the pattering of the rain on the turnip leaves; by the time you have cleared the hedge and ditch, the brood of cheepers has fluttered up in their turn, and you see them go streaming out of the opposite corner like crippled wild geese. Even if you have the luck to mark them down, still the chances are that you have seen the last of them. It is a backward year for the harvest; there are strips of corn left standing everywhere, and your intelligent friends find safe sanctuary in the very thick of one of the roughest of these. There is nothing for it but to take leave of them in the meantime, and to look forward to renewing acquaintance with them on the stubbles later in the evening, when the weather may have cleared, and their minds may have calmed down. Long before it is lunching time, and whether you are hungry or not, you are thinking of the contents of the baskets, and still more of the flasks or the beer jar. But how cheerless that meal is when you are seated upon damp straw under the dripping thatch of some outlying barn, looking ruefully on the almost empty game-bags and panniers. The very pointers have a hangdog look, as if they felt themselves guilty of the blank fields and were to be punished for your indifferent amusement. Matters may mend should the weather hold up in the afternoon, and you may cheer up a little in the watery sunshine that is gilding the shocks and throwing a ruddy light upon the stubbles. But it has been a very poor day at the best, and you feel sadly that you have missed a year. Succeeding weeks may have bright promise, or even brilliant performance, in store for you; but there is only one "first" in the season, and shooting afterwards you lose the charms of association and the brightest pleasures of early memories.

We suppose that old fires of September can never possibly have been half so delightful as they seem to us now, looking back at them over a waste of years. We do not imagine that the English climate can have materially deteriorated in a couple of decades, and we know that the weather was as fine then as now, and

keepers in most places not nearly so plentiful. Yet certainly the general impression of our earlier days is of clear skies and cool breezes, coveys in abundance and great sport among them. Whatever the sum total of the slaughter, assuredly we worked hard for the bag. Youth and healthy weariness would not be denied the night before, and though we might have sought our pillow hot with excitement, still, after some hours of the soundest sleep, we were up and refreshed with the earliest daylight. Having swallowed something that might pass for breakfast, we had unbarred the outer door for ourselves, while the maids were still in the arms of Morpheus, and had been received in the courtyard below by the keepers, who had already thrown gravel at our window to awaken us. There was a grey vapour reeking up everywhere from the damp turf, giving glorious promise of a splendid day. There were sprays of dew drops on every twig and tree, and clouds of cobwebs floating in the air or lying in silvery gauze upon grass and stubbles. Even the oldest and steadiest of the pointers, who had been slipped the first, went dashing madly down the sides of the hedge-rows, springing the first of the coveys in their unusual excitement. We have a vague impression that we had great shooting, there can be no doubt that it was very enjoyable, and yet, on analysing any particular morning's sport, we are driven to suspect we did nothing very extraordinary. For it is an odd thing that when you once order your memory back to duty upon the old familiar ground, it will often retrieve for you the minute incidents of any given day. You remember quite well how you missed your first right and left at the covey that Sancho flushed in the corner of the field opposite the kennel, where your companion, much to your disgust, "wiped your eye;" and, when you made a long shot with your second barrel, how the birds broke into that patch of gorse, and which of them you "tailored," and which you killed, and so on. But the very early mornings were seldom very deadly; and every one knows that towards the heat of the noon the birds always vanish mysteriously, and have the best of the game of hide and seek. You see the feathers and the fish-tailed earth where they have been braking and scraping on the stony banks, but as for the coveys that scraped an hour before, they are become as scarce as swallows in December. With all your juvenile enthusiasm, and considering that you made but a light breakfast in the small hours, you are ready enough for an early luncheon; a heavy lunch after steady exercise is apt to draw on a siesta, and after the short slumber in the warm shade, when to steady shooting for an hour or two. The sloop, the meal, and the premature start used to tell upon us, we feel convinced, though we did not care to own to it. It is a fact that in the early afternoon, when the scent was lying, and the birds had begun to appear again, our shooting rather went off than came on, and we seldom did ourselves anything like justice until the coveys were out on the field towards evening, when we were apt to "brown" them as they rose in little clouds, and sometimes did fatal execution. But all that is the mere prose of analytical detail, and it scarcely dims the halo of romance cast round those early shooting days which one enjoyed so keenly in the morning of life. Now we detest early hours, and should be afraid of rheumatism and colics in the head were we to turn out among the cobwebs of a morning. As for the buoyancy of spirits nowadays, that is more likely to come after luncheon than at 5 A.M., and we should never think of risking "forty winks" upon cool turf which must certainly be damp. Indeed, if our merits have met with their deserts, the odds are that an offhand day with pointers or setters and an old-fashioned keeper is altogether beneath us. We let the best of September go by, and we turn out at walking parties later in the season with the distinguished circle which our honourable friend is entertaining, as chronicled at length in the county paper. We walk his trumps in line, after all his stubble and meadows have been swept by flying horsemen. We have each our loader at our heels, and are armed with at least a couple of central fires. In place of dogs to set and back, we have retrievers to look to the dead and wounded. We shoot jealously under the eyes of a formidable gallery. We spend a fortune in cartridges and in subsidizing our host's head-keeper: and the game we massacre is carted to the nearest railway station to be consigned forthwith to London dealers. If slaughter is sport, there can be no question that we kill much more than we used to do. Yet the advance in line, with the carefully drilled rank and file, with leaders giving a word of command which you are expected to obey with military precision, smacks disagreeably of drill and the parade-ground. It reminds you at every step that you have sacrificed the freedom of movement and the right of private judgment that used to be the great pleasure of a day in the field. The retrievers running the winged birds by the nose are poor substitutes for high-bred pointers and setters hunting to the wave of your hand, drawing, standing, and backing like so many "pictures." We kill more than we used to do, and yet we sometimes sigh for the old September—for Don or Sancho and the old keeper, and all the antiquated paraphernalia of shot-belt, powder-flask, and loading-rod.

PROPAGANDISM AND SCHOOLS IN ITALY.

WE have already commented on the mingled impropriety and absurdity of the propagandism which perverts the cause of education into a means of offence, at once cowardly and vulgar, against the person and authority of the Pope. Other instances, less vulgar and offensive, but not less amusing or less appropriate, have been supplied by recent experience. The removal of

all prohibitions against the dissemination of the Holy Scriptures in Italy has multiplied the army of volunteer colporteurs whose one object in life seems to be to throw Bibles broadcast into Roman Catholic countries. Stories are told without number of tracts and Testaments pressed by the lavish hands of retired generals, admirals, and commissariat officers on hotel-keepers, hotel-waiters, and the casual travellers by steamboat and railway. We have little doubt that many of the reports which excite the enthusiasm of periodical gatherings in Exeter Hall owe the amplitude of their figures and the applause of their audience to the energetic importunity with which these Protestant light troops ply their unresisting victims. Probably the persons who congratulate themselves on the wide diffusion of the Bible in idolatrous countries do not often take the trouble to inquire what are the fruits of their liberal expenditure. They generally take for granted that every one who has a Bible or a tract thrust upon him immediately begins to study it with a resolution to learn the virtues and embrace the forms of Anglican Protestantism. It is a pity that people who subscribe for the purposes of conversion do not take some trouble to learn how far their well-meaning and zealous efforts succeed.

The Italians are in the main, and on all occasions of social intercourse, a courteous and polite people. They have, indeed, some habits and customs which are consistent neither with politeness nor with decency. But we are bound to say that whenever they recognize the intention of a stranger to confer a benefit upon them, they reciprocate the wish by a pleasant and polite acceptance of the kindness. At the same time they have a keen sense of any indelicate occurrence, and a dramatic mode of mutuating it. English sojourners in Italy will therefore have often heard from Italian lips vivid descriptions of the solemn gravity with which English zealots have opened their bags in a railway carriage and given to every Italian fellow-passenger a tract or a Testament; and of the equally grave politeness with which the gift has been received. But it is not the fortune of all Englishmen to hear the comments made upon a proceeding which even good intentions cannot divest of its impertinence; and we suspect that fewer still ever learn the purposes to which the donations are ultimately consigned. There is a recent story that an Italian officer, *a propos* of a conversation on cigarettes, suddenly startled an English bystander by the following anecdote:—"We were in garrison," he said, "and had exhausted all our stock of paper to make cigarettes with. One day a very dignified and courteous stranger—an Englishman—appeared, bearing a letter to the commandant, who introduced him to the officers. Before going away, he very civilly presented all of us with Bibles. These came most seasonably; for we have made cigarettes with them ever since."

That the result of these spontaneous efforts at conversion may often be ludicrous, and that its motive is inherently impertinent, may at some future day dawn upon the supporters of Protestant missions in Italy. That these missions must in the majority of cases be egregious failures is a certainty fully recognized by Englishmen who have mixed much with Italians. For, whatever may be the dissatisfaction of Italians with the government of the Romish Church, however marked their indifference to its dogmas, however profound or general their dislike of the priests, they have very little sympathy either with the forms or the dogmas of Anglican Churchmen or Anglican Dissenters. As to the ceremonies of either Church, they infinitely prefer those of their own. As to the doctrines, the majority of Italian men would pronounce those of one church as absurd as those of the other. And as to sitting down to study the points of difference between the two religions, how would such a devotion of time and labour comport with the claims of the theatre, the opera, the *caffè*, and the studio, to say nothing of Parliament, the Bourse, and the railway directorates? We would therefore warn those persons who may be zealous for the propagation of Protestantism in Italy against countenancing any system for the general conversion of adults. They may gather a rich harvest of converts of a certain kind; men who think they are good Protestants because they have long hated the Pope and the priests, or needy men who find that, whatever rewards Protestantism may give them in the world which is to come, it is not barren of recompense in that which now is. But we suspect that these are not precisely the converts whom English Protestantism is very anxious to embrace in its fold, and of others Italy is not likely to supply any appreciable number.

But although adult conversion is extremely improbable among Italian men, and wholly impossible among Italian women, it does not follow that Englishmen may not spend their money or their time bountifully and beneficially upon Italians, if they are so minded. The old restrictions upon keeping schools are removed. No precedent conditions are required but such as ordinary policy requires and ordinary good sense willingly assents to. The establishment of schools in and about Rome would be a really benevolent and useful undertaking. It would at once co-operate and compete with the State system. We do not of course recommend the creation of schools for the purpose of proselytism. Such schools would be equally mischievous and short-lived. There is sufficient priestly influence still in force to shut up schools that are aggressively and ostentatiously Protestant. And the peculiar kind of Protestantism which English propagandists would teach would certainly revolt the ordinary class of charitable Christians. But it does not follow that all religious teaching should be excluded from such institutions. That which the children have already learned might be enlarged and expanded in a spirit of Christian liberality and toleration. They might be taught

that Protestants and Jews are not (as they have hitherto been told) identical; that Protestants do worship the Saviour and do hold the Apostles' Creed—points on which the Romish priesthood has deliberately misled its pupils. Having set the minds of the pupils and the parents at rest on such questions, the schools might insist on a form of practical instruction which is now much needed. As far as they can be judged by their fruits, the ordinary public schools of Italy seem to inculcate few of the moralities of daily life. Truth, honesty, cleanliness, and industry may perhaps be inculcated in formal lessons, but assuredly they are not enforced by any strict and effective discipline. At any rate this is the opinion of Germans, English, and Americans who have resided for any length of time in the great cities of Italy. These strangers admit readily enough the kindly good-nature, the winning and sympathetic manner of the Italians, their pleasant salutation and their intelligent remarks. But they complain that in their intercourse with innkeepers, shopkeepers, and servants, the effect of the amiability and intelligence is almost always marred by some obtrusive incident of dirt, slovenliness, petty mendacity, or petty dishonesty. The man you deal with adds a few *lire* to your bill, or charges you more than he promised to charge; or the tradesman or the lodging-house-keeper whom you visit in order to settle some contract receives you in a state of squalid semi-nudity, a dirty coat or dirty gown thrown hastily over foul linen, unwashed hands clutched at unbrushed trousers, and unwashed feet protruding from grimy slippers, upon a floor oozing with a mixture of street dirt and saliva. Then, as to external decency, were ever such indecent caricatures of it seen as in the streets of Rome and Florence? Both these cities are infinitely cleaner and more decent than they were twenty years ago; so that their former condition may be imperfectly imagined by the present generation. Again, take the lowest class and the lower *bourgeoisie* of any city of Southern Italy, and we defy any European country (except of course Spain) to produce anything like the dirt and indecency seen in the land from which dawned the earliest light of modern civilization. And if the cities are bad, some parts of the country are worse. Nothing—not even the condition of the most neglected districts described by the Commissioners who have reported on the agricultural poor of England—can be worse than the condition of the poor peasants who vegetate in the Roman Campagna. Within a radius of ten miles from the Eternal City, the metropolis of the Roman Catholic Church, the spiritual capital of one hundred and fifty millions of European Christians, there is to be seen as much misery, squalor, dirt, ignorance, and poverty as is to be found in any of the least civilized parts of Europe. We think that this fact constitutes a terrible charge against the Romish priesthood. These men have for centuries enjoyed great wealth and almost absolute power; they have received large revenues and exercised boundless influence; they have had practically the education of the people in their own hands. And what are the fruits of this power and wealth? Such as we have described. We may indeed be reminded that the circumstances of the Campagna are exceptional, that the pestilential quality of its summers prevents the residence of the landed proprietors on their estates, and that necessarily the peasantry must huddle together by themselves in dreary hamlets or mope in solitary hovels. But the absence of the proprietor and the want of his supervision are evils not confined to the Campagna. They are common to a large portion of the Emilia. They are common in Calabria and Sicily. And this want only makes the action of the priest more necessary and more legitimate. How has the priest dealt with these poor savages, in whose minds neither the smoky vapour of their hovels, nor the desolation of their villages, nor the sharp grip of poverty, has wholly crushed all gentleness of feeling and all brightness of intellect? How has he fed these involuntary sheep of his flock? What has he done for them? Nothing, absolutely nothing. He has not taught them to read, for fear they might read heretical books. He has not taught them to write, for fear their daughters might write love-letters. He has not taught them honesty, so that, if they have the chance, they will cheat or rob. He has not taught them humanity; he has only told them that the horse, the ox, and the ass "*non sono Cristiani*"; therefore the Roman, like the Neapolitan peasant, shocks all foreigners by a ferocious cruelty towards dumb animals, quite out of keeping with his general character. In a word, the priest has left the mind of the peasant as he found it—a blank. But has he not taught him religion? He has taught just so much of religion that the peasant crosses himself on passing a crucifix, kisses the toe of his patron Saint, and bows to the image of the Virgin. But, if you ask him about a God, or immortality, or religious and moral duty, his answers will show a condition of sheer heathenish ignorance, or worse.

In such a state of things, which, we must add, cannot be generally predicated of Tuscany or Piedmont, it is obvious that missionary zeal and benevolence may find plenty of work for itself in the establishment and endowment of schools. They would not only teach the rudiments of reading and writing to those who are wholly ignorant, but they would discipline the savage and humanize the half-brutal. They would in a measure, though not adequately, compensate for the absence of that cultivated and leisured class which in England has exercised so wholesome an influence over the manners and feelings of our rustics. They would, if well managed, counteract by a beneficial discipline that loose shambling *laissez-aller* into which Young Italy is rapidly falling. They would make untruthfulness to be counted shameful, and dishonesty a sin. And they would raise to

the height of the Northern standard the despised and neglected virtue of cleanliness. Great indeed would be the reward of efforts so wise and benevolent, carried to a successful end. Italy is now awakening from the torpor of centuries. She is taking her proper place among independent nations. Her sons are competing with all Europe in the arts of self-government, of commercial enterprise, and of national development. They are distinguished by rare quickness of apprehension, by a rapid capacity of inspiring sympathy, and by excellence in certain special vocations. Is it not worth while to contribute towards institutions which may ultimately efface the accidental blemishes of the Italian character, and give to it a symmetrical grace and moral harmony? At all events we are sure that this is better worth while than to scatter about Bibles and tracts at random.

ELEPHANTS.

THE popular English notion of elephants is ordinarily derived from the Courts and camps of the East. They are rightly enough believed to play a prominent part in reviews, Durbars, and other solemn pageants in which Oriental magnificence is seen side by side with British symmetry and order. Most Englishmen are aware that a considerable number of the tigers annually slain in our Indian dependency are shot by sportsmen severely seated in howdahs on the backs of elephants; but these useful beasts are employed for many domestic purposes, and are often maintained all over India by native gentlemen who never faced a tiger or handled a gun in all their lives. Under the Mogul Emperors the "*Fil-Khanah*," or "*Mansion of Elephants*," was a regular department of the State; and the officer in charge of it had a rank and significance analogous to that of the Master of the Backhounds with us. The Great Akbar used to beat the jungles with a line of elephants extending for a quarter of a mile. Some native princes have derived a vile pleasure from witnessing a duel between two of these well-matched antagonists; and their services have been often called into requisition to put ignoble criminals to a barbarous death. Scott, whose knowledge of India, derived from members of the civil and military services, was invariably correct and striking, has introduced an elephant to contribute to the *dénouement* of one of his least read novels. In the *finale* of the *Surgeon's Daughter*, the apostate Richard Middleton, who has just received what was his due from the bounty of Tippee, is told to accept the fruit of the justice of Hyder, and is crushed, in open Durbars, under the foot of a well-trained elephant. "The cry which the victim uttered," we are told, "was mimicked by the roar of the monster, and the sound, like an hysterical laugh, mingling with a scream, which rung from under the veil of the Begum." No amount of Indian experience, we may observe, could have enabled any writer to describe better types of the age and time than have been given by the great novelist in the desperate adventurer Middleton, Hartley the Doctor, Tom Hillary the crimp, the Amazonian Mrs. Montreville, and, we may even say, Tippee and Hyder, who have the same sort of resemblance to the real rulers of Mysore that the Greeks and Romans of Shakespeare have to their originals. It is not very long since that the indignation of the Government of India was expressed to the ruler of Baroda, who had fastened an unlucky offender to the feet of an elephant, and had had him pounded to death in this fashion through the main streets of the city. Bernier's entertaining travels contain sundry notices of elephants as forming a part of the royal establishment. The Emperor every year went away from "*Agra* or "*Lahor* of great Mogul" to escape the hot season in the cool and picturesque valleys of Cashmere. In fact, he did what the present race of English Viceroy is every now and then attacked for doing; he sought a climate where life could be enjoyed, instead of being merely endured, in the hot winds and rainy season. On one of these expeditions some elephants of the King's household took fright in a mountain pass, and fell over a precipice some hundreds of feet in sheer depth. Bernier, who came up in the *cortège* three days afterwards, saw the unfortunate beasts still alive at the bottom of the pass, moving their trunks and dying by inches. It is creditable to this writer's accuracy of description that a few years ago an English officer, travelling by the same route, believed himself, on reasonable grounds, to have ascertained exactly the very spot where the accident took place. Had Livy, instead of muddling up two different accounts of Hannibal's passage of the Alps, applied himself to a critical and local examination of his original authorities, we might have been spared all those distressing doubts as to the exact position of the "*White Rock*," and have perhaps even been enabled to fix the place where the solid mountains were or were not melted down with vinegar.

The possession of an elephant or two is, as we have intimated, by no means confined to royal or princely families. Landholders and English gentlemen engaged in commercial or agricultural pursuits in the interior of the country find such an animal to be well worth his keep in many ways. It brings in the collections of rent from an out-station to headquarters. It takes important letters or supplies right across country. It will carry half-a-dozen servants, with bed, baggage, and cooking apparatus, to any place where these adjuncts or necessities cannot be relied on. It enables the native agents of a factory to travel about with security against accidents or robbery. Where roads have not been constructed, or are impassable for vehicles during the rainy season, the elephant is equal to any emergency. To swim rivers,

to skirt or wade through swamps, to step cleverly over fences, to fray a path through reeds, to break down forest trees firmly connected by long trailing creepers, is a comparatively easy task to this sagacious, powerful, and obedient servant. It is true that three or four miles an hour is the average rate of progress, and that it is hardly fair to exact of an animal more than fifteen or twenty miles of march in the day. It must be admitted, too, that practice is necessary to accustom the traveller to the motion, and that the paces of all elephants are not the same. Some are so smooth as almost to invite slumber; on others the unlucky occupant of the cushion rolls about as at sea, and arrives at his journey's end with sore pains in all his joints. But the docility of the beast and the security of this mode of conveyance are, where rapidity of communication is not essential, of the very greatest convenience to residents in the plains. The owner of an elephant has besides a far greater guarantee for respectability than the owner of a gig. It is not to be imagined, however, that elephants cost nothing, or can prosper without care and attendance. A prudent person will guard his elephant from the deluge of a tropical rain, and to this end a high-roofed barn must be constructed with open sides large enough to admit something of the size of an ordinary haystack. Then the bath is as indispensable to the elephant as it was to an old Roman, or a good breakfast to the jurymen of Dickens; and after a daily plunge and a swim, during which nothing is seen of the animal but the tip of his trunk, it lies down on its side at a signal from the driver, and submits to be oiled, cleaned, and brushed, while thorns or foreign substances are extracted from the toes. When these operations are concluded, a chain is fastened round one hind leg, and made secure to a post or tree, and the remainder of the day is passed by the elephant in obliterating the traces of the bath by showers of dust, or in driving away the flies with a leafy branch. The food generally consists of several pounds of coarse rice, the stem of a plantain tree, and a whole cartload of tender branches recently cut. To procure this latter supply is the daily duty of one of the attendants, who in Indian phraseology is termed "a mate," the title of *Mahout* being reserved for the head keeper. Not every kind of leaf is palatable, and whole tracts of country covered with forest trees are absolutely useless for the feeding of elephants. When on a march, or in the jungles, elephants will endeavour to feed all day, and will snatch at anything edible. Those who are now groaning over the price of coal will hardly be consoled by the knowledge that the price of an elephant's keep has almost doubled in the last quarter of a century. Formerly in the Gangetic Delta an elephant, with its two attendants, cost little more than 2*l.* a month. The amount is now fully double, and in other and drier parts of India, where forage is scarce, it reaches the high figure of 6*l.* or 7*l.* Elephants are also very liable to be disabled by sore feet or to get out of condition. Thorns, stumps, and stones cause laceration and lameness; sores and ulcers arise from neglect or carelessness in fitting on the howdah; and internal disorders are betrayed by the animal itself, which literally consumes lumps of earth to show that it needs a purgative. Then an elephant may, under bad management, become as fertile a source of quarrel as rabbits or hares. Some have a vicious habit of getting rid of their fastenings, and making nightly expeditions into fields of rice or sugar-cane. A Mahout, with the recklessness or nonchalance of Asiatic menials, will take his elephant right through a field of rice, wheat, or pulse to save a circuit of a few hundred yards, or he will permit it to pluck the finest fruits of the orchard, or, as he passes through a village, will slyly connive at a push or a shove that annihilates a line of storehouses, or huts made of wattles, mud, and thatch. Incensed landowners, defrauded of their rents or defied by their tenants, have often been known quietly to send a posse of servants on an elephant into the garden or field of their adversary, and to trust to subsequent chicanery and corruption to meet and counteract the tale of a plundered homestead and a ravaged crop.

About a quarter of a century ago elephants played, or were made to play, a very active part in boundary disputes, or contests for new tracts of alluvial formation, with which the Executive was then wholly incompetent to cope. Districts were at that time of enormous extent. The laws against what are termed agrarian outrages were palpably lax, the police was wholly officered by natives, and encroachments were either attempted or resisted, on the part of the proprietors, by the aid of organized bands of strong-limbed and well-paid club-men. A desultory engagement ensued, in which, so the police report stated, a couple of men were transixed with spears and died on the spot, and three or four more were wounded; and then the fight was fought over again in the criminal and civil courts. In a long and acrimonious litigation it was minutely described how the aggressor had sent one servant on a lay pony, a second on a white ditto, and a third on the elephant; how, at a given signal from the howdah, the ripe corn had been fired or the well had been choked; how this tenant had been speared with a javelin because he would not give up the inheritance of his fathers, and that he had been riddled with buckshot because he had refused to swear to a lie; and, finally, how the huge bulk of the earth-shaking beast had been employed to finish the work of the club-men, and to pound hearth and homestead into a chaotic mass. Unluckily, in these statements, graphically detailed and sworn to in essential particulars by a score of respectable witnesses, there was a substratum of truth and a vast superstructure of falsehood. Two men had possibly been killed, but they belonged to the oppo-

site party, or they were not dead at all, but had been conveniently kept out of sight to give colour to the story; no four-footed animals had appeared on or near the battle-field; the servants whose dignity and position required ponies or elephants for locomotion had in reality kept quietly out of sight in some friendly or neighbouring village, and had allowed the rough work of violence to proceed through the agency of subordinates, who had been instructed as to what was required of them in the interests of their master by a few words as significant as the old Latin formula to the Consuls—*ne quid detrimenti respublica capiat*.

These tales are happily almost obsolete, and the iniquities, real or imputed, of the elephant are now more often confined to the abstraction of two or three sticks of sugar-cane, or to the treading under of some perches of a newly-planted crop. But occasionally damage to property and life is done by a tame elephant which gets loose in the rutting season, and is transformed from a drudge as serviceable as the "lubber fiend" into a demon of inventive malice and deliberate revenge. An elephant has been known, when in this state, to take up a commanding position on a high road and near a village, and to deal death and destruction round him for a week together. Old women and children caught and pounded to a jelly; corpses whirled round in mockery by the trunk of the infuriated animal; several houses unroofed or thrown down; portly native gentlemen flying out of their palanquins; communication stopped, and the whole neighbourhood in a panic—this has not unfrequently been the tenor of the police reports for days, until a spherical bullet from the practised hand of a sporting magistrate or indigo-planter gives the destroyer his quietus. Sportsmen accustomed to the jungles well know that there are only two or three places where a shot is effective. Either the charge of the animal must be awaited, and the aim must be taken at the hollow just above the trunk, or, if the sportsman has not coolness enough for this venture, a side shot through the eye will do equally well. More than forty years ago the elephant that went mad on Exeter Change exhausted something like a barrowful of bullets before he could be destroyed, the assailants being either ignorant of the vital part, or being unable to catch the animal in the necessary position. It is well known that the late Major Rogers had killed some twelve hundred wild elephants in the jungles of Ceylon, and rarely failed in despatching his victim at one shot. But then he had thoroughly studied the habits of the animal, whether single or in herds, was a first-rate shot, and had the assistance of a native so cool and daring as to be able to walk up to a herd and pull the tail of an unsuspecting beast, which, in consequence, looked round and presented a favourable shot to the experienced sportsman.

Elephants live, it is generally believed, to the age of a hundred or a hundred and twenty years, and average six to seven feet in height. A very few years since one died at Benares which was believed by local tradition to have carried Warren Hastings. At seventy years old the animal is quite in its prime, and will perform long marches, beat the jungles for a whole day, and receive unmoved the charge of the solitary buffalo, a greater test of staunchness and confidence than the rush and roar of a tiger. The price of a docile elephant, free from disease or vice, and with many seasons of usefulness before it, varies from 60*l.* or 70*l.* to 120*l.* Much higher sums are constantly given for those which have a reputation in the sporting world, or which are conspicuous for their height or symmetry, or are peculiarly fitted to play a part in festivals or social pageantry. An elephant of nine, ten, or eleven feet is rare, but is magnificent to behold. Each animal has its name. The female is "the Pearl," the "beloved" one, or the "golden mouth." Recent history or ancient tradition is called on to supply appellations for the males, which range from the familiar sounds of Hyder Ali and Tippee on the one hand, up to the mythic heroes of the Indian epics on the other; Bhima, who wielded a mace like Athelstan the Unready, and Arjuna, who, like Ulysses, distanced all competitors in the use of the bow. Herds of these animals in a wild state are still to be found in Central and Southern India, in the jungles of Assam, and also in the forests which skirt all the Eastern frontier of the Indian peninsula. It is scarcely necessary to add that elephants cannot be used for practical purposes except in hot climates. But there are few sights more in harmony with an Eastern landscape than a line of some fifteen or twenty elephants waiting, by the side of some well-known cover, for the signal to commence operations, or than the solitary animal which may be seen towards evening in the months of January or February, slowly wending its way over an enormous plain to a cluster of white tents in which a couple of English officials are recording the results of a survey of the country, or have been dealing out useful advice and summary justice to a whole village population.

ART AT THE VIENNA EXHIBITION.

IV.

WE have never known an International Exhibition so pleasantly peopled with statues as the present one. The Vienna galleries may be said to be inhabited not only by great historic characters, but by creations of the imagination, personalities long familiar in the world of literature and art. We are here in the presence of Virgil and Agrippina, of Francis I., Molière, and Mirabeau, of Beethoven and Rossini, of Hegar, Iphigene, Judith, and St. Agatha, not to mention Venus, Cupid, Psyche, and a host besides, such as nymphs at a fountain

and girls reading on a chair or working at a spinning-wheel. The total amounts to more than nine hundred statues, whereof Italy contributes 215, France 196, united Germany 183, Austria 159, Russia 44, and England 29. We are sorry to add that the collection is not distinguished by novelty or merit; many of the works have for the last ten or twelve years been in almost incessant transit from exhibition to exhibition; for example, Signor Magni's "Reading Girl" is, to our knowledge, now on public view for the fifth time. Indeed this overrated figure has, we imagine, been so often multiplied, that it might easily appear in two or more places at once. On the whole, it must be admitted that the collection has fallen rather flat on the public mind, not so much because the average merit is lower than might have been anticipated, but rather from the want of some few master works which might stand out prominently as signs of genius or as pledges of progress. In short, sculpture throughout Europe has for many years ceased to be one of the progressive arts; movement, in fact, has been mostly in wrong directions.

Italian sculpture is once again distinguished by refinement and debility, by a generalization of form which has long failed to be in close and vital contact with nature. And yet these frailties are akin to beauty. Many of the works here displayed, though hackneyed in idea and emaculate in modelling, may be received as the last surviving traditions of an ideal style which has descended almost in unbroken succession from ancient Greece and Rome. In these galleries, decorated with pretty pleasing figures, the marble soft as wax and white as unsummed snow, we almost imagine ourselves in those Roman studios, or rather shops, wherein popular figures, manufactured wholesale, are placed in tempting groups before English and American travellers. In Vienna the prices are printed in the Catalogue, the primary motive being business. The prevalent style, we need scarcely say, continues to be that of Canova, a style which in the hands of Tenerani—ever to be remembered, if only by the "Swooning Psycho"—was instinct with the sense of beauty. And still a peculiar fascination pertains to the plastic arts of Italy. As we walk along these galleries we are scarcely in the presence of cold, inanimate stone; the marble breathes and moves, sentiment plays on the features, the nerves and muscles pulsate with sensibility. And yet sometimes we might almost fancy ourselves in the midst of Madame Tussaud's waxwork, where half-veiled figures are seen heaving under contrivances which simulate the breath and movement of life. Even thus far is the sculpture of modern Italy removed from the sternness and the immobility of the antique. The present collection has not been saved from mediocrity and servility by any group comparable to Signor Fedi's famous composition, "The Rape of Polyxena." Still for careful compilation, romantic prettiness, and softness in chiselling, we may admire "Saffo" and "Giustizia" by Professor Magni of Milan; "Nydia," the blind girl in the *Last Days of Pompeii*, by Signor Gianotti; "Modesty," by Signor Bottinelli; and a veiled figure of "Flora," by Signor Ansighione, all severally of Rome. How incapable are artists thus trained in a school of effeminacy of rising to the dignity and power demanded by monumental art may be judged from the colossal statue of "History" modelled by Cavaliere Tandardini for the monument to Cavour in Milan. The figure of "Victory" by Cavaliere Consani of Florence is also one of those commonplace creations which are easily multiplied by tens and by hundreds whenever wanted. Napoleon III., modelled at Chislehurst by Conte Aldofredi—a statue which stands as the solitary representative in this world-wide Exhibition of a personage but recently all but omnipresent in European art—has the merit of being a portrait true to the life; the bearing is meditative, even melancholy. It may be worthy of observation that, whereas in previous International Exhibitions Napoleon III. was only to be seen in marble, he is now reduced to common plaster, and in place of a purple canopy his uncovered head is here exposed to the inclement elements. The work is not by a Frenchman, but by some Italian who chanced, it may be supposed, to find himself at Chislehurst. In fact, Italian sculptors have become something like Italian organ-grinders, itinerant and ubiquitous, and what they do in marble is analogous to the tunes of Rossini, Bellini, and Verdi, which, applauded in the Italian opera, are next ground out in the public streets. It remains, however, for us to admit that of late years the Canova decadence which proved the curse of Italian sculpture receives some slight revival in two directions. First, in Milan appear figures decorated with flowers and decked in draperies which flutter in the breeze and glitter in the sun. The style does not pass triviality, and successive International Exhibitions prove that a manner which first had its attractions in the end a snare and a corruption. But then concurrently, as if to prove that Italian genius can never wholly die out, compositions issue from the South of Italy of a dash and devilry which point not to decadence, but to revival. In the midst of an art which would seem to prognosticate an ignominious end, appear unexpectedly in Naples and Palermo figures such as "The Mendicant," by Signor Raffaello Belliazzi, "South Sea Islanders," by Signor Civillotti, and "Prometheus," by Signor Ximenes—works which prove that genius is not extinct, and that access to nature is not cut off. In Naples the arts have been accustomed to burn and to blaze as with volcanic fires. The spirit of Masaniello and the lawlessness of Salvatore Rosa even now burst out afresh among the people.

France, which takes in sculpture as in painting the first position among European nations, adopts styles in direct opposition to the schools prevalent in Italy. She has no leaning towards romance, no liking for trivial graces; she cares not for a beauty disunited

from physical and intellectual forces; she seeks not to adorn a drawing-room, but to ennoble a Senate-house; she is seldom decorative; she is stern and severe, and rises to a style immobile and monumental. One of the noblest works we know is "The Statue of Virgil," from the court of the Louvre, by M. Jules Thomas, "Prix de Rome" in 1848, and a first-class medalist in 1867. The French have a way peculiarly their own of making an historic character stand at a remote distance from present times; their figures are thrown, as it were, into chronological perspective. The manner is strictly independent; sometimes it approaches the classic, yet without suspicion of servility, and sometimes it touches the mediæval, yet without taint of superstition. The execution disdains the vague generalization, the soulless mechanism, the smooth surface polish, which are the bane of English, Italian, and German styles alike; the modelling is sharp and firm; it knows how to be sketchy and yet complete. A Frenchman ventures to leave off at the point where weak artists begin to spoil; he is proud to throw aside canvas or marble while yet it retains the signs of grand and suggestive negligence. Thus the reader will understand that Parisian sculpture has freed itself from the falseness and affectation of Pradier, who translated Canova into what was most meretricious in the French manner; and we are glad also to observe that the still more obnoxious style of M. Clésinger obtains less following than might have been feared. Yet "Danseuse aux Castagnettes," by this voluptuous sculptor, is vulgar in the extreme. This repugnant figure obtains all the more importance by being in bronze, and here we may remark on the unapproachable merit of the French bronzes universally. Paris has long had the advantage over Munich and Rome in the sharpness, detail, and truth of bronze-casting and workmanship. As samples of the thorough training France is still able to show, we mention the following well-accredited figures:—"Un Nécophte" (style classic), by M. Cavalier, Member of the Institut; "Enfance de Bacchus," by M. Perraud—a figure well known, capitally modelled, style French classic; "Narcisse," by M. Dubois—a work removed from the classic and the Italian, inasmuch as the subject has been approached through a grand French naturalism; also "Agrippina," by M. Maillet. Here the face is veiled and the figure densely draped; dignity and command remove the work from the pretentious of Italian veiled faces by Monti and others. "David," by M. Mercié, is masterly, individual, strong, and, like other great French works, without taint of conventionality. We must also mention Louis d'Orléans, an equestrian statue in bronze, by M. Frémiet, as approaching to the best Italian cinquecento, and comparable to the trenchant equestrian statue of Colleoni in Venice. Only France can produce figures of the exceptional character of those just quoted. We have naturally enumerated some of the best works in the French department; presumptuous products by mere novices, also feeble wanderings by men honoured in their dotage, we pass by. The indiscretions of youth and the infirmities of age present pretty much the same aspects in all times and in all countries.

The Germans, for reasons not very apparent, are less illustrious in sculpture than in painting. One cause for present deficiencies may be the absence of chief men, such as Schwanthaler and Rauch, to whom the embellishment of Munich and Berlin were greatly due. Another cause lies in the fact that the revivals which have given life and progress to the art of painting stopped short of sculpture. The spiritual and mediæval school of Overbeck, the classic and eclectic style of Director Kaulbach, and the realistic yet academic manner of Professor Piloty, have scarcely been reflected in sculpture. In the present Exhibition the best works are "Hagar and Ishmael," by Professor Wittig, of Düsseldorf; a statue of "Rauch," by Professor Drake, of Berlin; a portrait-bust of Professor "Schnorr," of Carlsfeld," by Herr Donndorf, of Dresden; also four portraits and several sketches fertile in fancy, by Herr Wagnmüller, of Munich. The Germans feel a laudable pride in placing their great men on public view, but of the many statues which adorn their chief cities, Rauch's Albert Dürer, in Nuremberg, is almost the only work which does justice to a master intellect or a noble life. Nothing can be more irredeemably wooden and stolid than the various effigies set up in Frankfurt, Mayence, Worms, and other cities to Göthe, Schiller, Gutenberg, Luther, and sundry men of the Reformation. The solemnity which a German assumes when he approaches marble is truly appalling; in Vienna we found but two faces that were permitted to relax into a smile. And just as the heads are ponderous and senseless, so are the draperies learned and lifeless. In like manner the execution is heavy and mechanical, smooth without delicacy, and hard without sharpness. To a German are denied that sense of beauty which seldom leaves an Italian without a charm, and that daring conception which usually saves a Frenchman from inanity.

Some nations, such as Norway, Sweden, and Holland, are found to be barren of sculpture, and even Belgium, in the absence of her best men, appears but indigent. On the other hand, Denmark, as usual since the days of Thorwaldsen, is stronger in sculpture than in painting; "The Panther Hunter," by Professor Jerichau, when exhibited in our Royal Academy, placed all surrounding works at a disadvantage. Switzerland takes the world by surprise; among forty works which she produces the bronze bust of Bianca Capello stands conspicuous by its nobility. The artist favourably known in the London Academy, owes much to her residence beyond the Swiss frontier. This lady not unnaturally attracts some attention; we therefore transcribe the entry in the Catalogue which indicates her antecedents:—"Marcello, Fürstin de Cas-

tiglione Colonna, geboren Gräfin d'Affry von Freiburg, in Paris." Russia, as travellers to the North well know, created for herself a school of sculpture which in its ambition was akin to her stilted school of painting. On the present occasion she shows little that is new; the small, sharply articulated bronzes by Baron Peter Clodt, and the grandly conceived figure, also in bronze, of "John the Terrible," we noticed a year ago when exhibited at Kensington. In conclusion, we may point to a marble group of "Cupid and Psyche," inasmuch as the sculptor, M. Runeberg, is a Fin; the northernmost territory yet penetrated by painting and sculpture is Finland, and yet unfortunately the style is here that of Canova; so true is it that in the art of sculpture originality and distinctive nationality are now denied to modern Europe. The survey of the Vienna Exhibition proves that, of all arts, that of sculpture is most servile. The nine hundred works here brought together are, with comparatively few exceptions, not creations, but compilations.

REVIEWS.

PICOT'S HISTORY OF THE STATES-GENERAL.*

(Second Notice.)

WE left the States-General at the time when they had come under the benumbing influence of "the spirit of abdication." They were nevertheless a popular institution which the rival parties of the reign of Louis XI. strove to turn to their own account. At one time the moderate princes called for them in order to embarrass the King; at another, the King, turning the tables upon his adversaries, convoked the States in the hope of obtaining a manifestation of public feeling in his own favour, and of escaping under cover of their authorization from the treaty by which he had bound himself to yield Normandy to his brother. The event proved his sagacity. Between a set of factious and traitorous princes on the one side and the royal authority, which meant national unity, order, and the lowering of the nobles, on the other, the Estates were not likely to hesitate as to their choice, and they gave Louis all their support:—"Louis XI était jeune; on disait sa volonté inébranlable; il n'aimait pas les nobles; c'était le roi qui devait réver le tiers état." But the tiers lived to love Louis as little as did any other class, and to hail his death as a deliverance. The *cahiers de doléances* of the States-General which, on the accession of his son, met at Tours, reveal the miseries of the country:—

Et pour toucher à telles charges que nous pouvons appeller non pas seulement charges importables, mais charges mortelles et pestifères, qui eust jamais pensé ne ymaginer veoir ainsi traicter ce povre peuple, Jedis nommé François? Maintenant le pouvons appeller peuple de pire condition que le serf; car ung serf est nourri, et ce peuple a esté assommé des charges importables, tant gaiges, gabelles, impositions, et tailles excessives.

In many parishes the *taille*, which under Charles VII. had been forty or sixty livres a year, had subsequently risen to a thousand livres. Foreign invasion could hardly have reduced Normandy to a worse state than that to which it had been brought by the burdens which its King laid upon it. Many of the inhabitants had emigrated to Brittany, and even to England; some, driven to despair, had slain their wives and children and themselves; numbers had died of hunger; the survivors, men, women, or children, might be seen, for lack of cattle, harnessed to ploughs, and the greater part of the land lay waste. The conduct of the troops is again the subject of complaints:—

Il fault que le povre laboureur paye et souldeye ceux qui le batent, qui le deslogent de sa maison, qui le font coucher à terre, qui lui ostent sa substance; et les gaiges sont bailliez aux gens d'armes pour les preserver et deffendre et garder leurs biens.

Yet, bad as the government was, the nation was still loyal. On the meeting of the States of Tours, the Chancellor, De Rochefort, in his opening speech, insisted on the fidelity of the French people to its King, as the most striking trait of the national character; and, by way of contrast, pointed to the neighbouring country of England as changing its reigning families, disinheritting its rightful heirs, and marking each accession by a new revolution. M. Picot remarks that the speech would be equally true nowadays if only the names were transposed. It may be noted as an instance of rashly setting down as a national characteristic that which is only the result of special circumstances. Perhaps revolutions, like hot and cold seasons, run in cycles, and the time may come when an orderly and stable France shall look on with complacent pity while we are given up to the young Republicans who so condescendingly assure us that it is not their intention to overthrow the constitution of their country just yet. Another reflection is suggested. After all, to this battle-ground of rival dynasties and factions described by the Chancellor, oppressed Normans had fled from the despotism of Louis XI.; a fresh proof of what we know from other sources—the vastly superior condition of the common people of England to that of the common people of France. English kings and princes might be disinherited, English nobles driven by fortune of war to exile and beggary; but, on the other hand, English peasants were not

drawing ploughs like oxen, or killing themselves to avoid dying of starvation. The French Revolution of 1789 has tended to dry up those ancient springs of English patriotism and self-confidence which arose in great measure from a sense of contrast. An English peasant and a French peasant are now much on a level, if indeed the advantage be not on the side of the foreigner; in the fifteenth century the former was a freeman, while his neighbour across the Channel was treated like a beast of burthen. The insular pride and the insular contempt of foreigners had then solid facts to justify them.

A remarkable feature of this assembly was that in most of the towns the three orders chose their deputies in common, so that the clerks, nobles, and burghers who met at Tours did not exclusively represent their respective Estates. This may to a great extent account for the absence of that class rivalry which came out so strongly in some of the States-General of later times. Another characteristic was the unwonted oratorical power displayed. It was then that Philip Pot, Seigneur de la Roche, for his eloquence called the "bouche de Cicéron," made, in opposition to the theory that during the youth of the King the government devolved of right upon the princes of the blood, that celebrated speech which so boldly asserts the sovereignty of the people—that is, of the nation, for the speaker was careful to explain that he gave the word no narrower meaning. History tells us, says the Burgundian orator, that in the beginning the sovereign people elected its kings, choosing out men who surpassed others in virtue and ability. How do vile flatterers attribute the sovereignty to the prince, who himself only exists by the people? The people has a double claim to direct its own affairs, because it is the master, and because it must always suffer by misgovernment. This is decided language in the mouth of a *gentilhomme* of the fifteenth century, godson and favourite of Duke Philip the Good, Seneschal and at the time of his death governor of his native land of Burgundy. It would appear that he carried out his liberal principles in his government, for M. Picot tells us that "sa douceur et ses talents l'avaient fait adorer de la province." The States employed to small purpose the powers which the Burgundian orator attributed to them. Timid, hesitating, influenced, especially the Parisian deputies, by local ambition and jealousy, they lost the opportunity afforded them of electing part of the royal council, and of thus obtaining control of the government—a want of vigour which excites M. Picot's indignation:—"C'était une conjoncture unique dans l'histoire, et la postérité ne doit pas pardonner aux hommes qui l'ont laissée échapper." They endeavoured, however, to make themselves a power by reasserting their right of voting the taxes, and by demanding biennial convocations of their body. A formal promise was given by the council that they should be called together within two years' time; how it was kept may easily be supposed. After a year had passed the Duke of Orleans—he who became Louis XII.—represented to the Parliament at Paris that the grants made at Tours were being exceeded, and, supported by the Count de Dunois, he insisted upon the necessity of the States being convoked. As no one gave him credit for any but private motives, the only result of this attempt was to frighten those who might otherwise have raised their voices to demand the promised assembly. Louis himself evidently considered the States-General to be among those affairs of the Duke of Orleans which it did not befit the King of France to remember, for he let seven years of his reign pass before he issued any summons. He took, indeed, the best way of preventing any outcry by proving himself a King after the nation's own heart, and carrying into effect the reforms called for at Tours. When he did assemble the deputies, the orator of the States, instead of setting forth their grievances, had the unwonted task of expressing the national gratitude. "Pour ces causes," added the speaker, after recapitulating all the improvements which were owing to the King, "et autres qui seroient trop longues à réciter, il devoit être appelé le roy Louis douzième, père du peuple"; and general acclamations showed that the title then given was no piece of court flattery, but the utterance of genuine feeling. The scene is touching; but yet the reign of this admirable prince serves to show the weakness of the States-General. They never made themselves permanently necessary; it never was impressed upon an enlightened ruler that his first duty was to co-operate with them. Consequently, instead of gaining strength under a good King, they lost it, and when the time came to grapple with a bad one, they had no store of political experience to guide them.

We have dwelt so long upon the earlier States-General that we have small space left for those later assemblies which occupy the greater part of M. Picot's work—the States of Orleans in 1560, in which Michael de l'Hospital pronounced the opening speech; the States of Blois in 1576, where the lay orders so stubbornly refused the subsidies asked for by Henry III.; their successor in 1588, whose deliberations were so rudely startled by the *coup d'état* which deprived the League of its great chief, and placed the leading deputies in the power of the King; or the States of the League, convoked by Mayenne to choose a King for France; or the Assembly of 1614, the last of the ancient States-General. Glancing back over the account of the Orleans assembly, which met just after the death of Francis II., by whom it had been convoked, we may note how well the art of managing elections was understood. The royal edict summoning the States gave the bailiffs plain intimations that they were expected to exert themselves to prevent the return of opponents of the Guises:—

Vous ne sauldrés [says the King] de tenir l'œil ouvert et donner

* *Histoire des États-Généraux considérés au point de vue de leur influence sur le gouvernement de la France de 1355 à 1614.* Par Georges Picot, Juge au Tribunal de la Seine. Ouvrage couronné par l'Académie des sciences morales et politiques (premier prix du concours d'histoire). Paris: Hachette et Cie. 1872.

ordre que les esprits malins qui pourroient entre composer des reliques de la rebellion et tumulte d'Amboise, ou d'autres gens studieux de nouveleté et d'alteration d'estat, soient tellement descouverts, et selon la seureté de nos edicts retenus, que par leurs machinations, sous quelques prétextes qui les couvrent, ils ne puissent corrompre ceux qui les peuvent écouter.

Even with such precautions the Cardinal de Tournon reproached the Guises for having convoked the States at such a moment. He himself, he said, and the Constable de Montmorency, had, under King Francis I., done their best to destroy the remembrance of such assemblies, which, as he shrewdly remarked, "avoient toujours en cette coustume à toutes mutations de roy de trouver fort mauvaises les choses passées, en sorte que ceux qui avoient gouverné et manié les affaires avoient beaucoup à souffrir." In a political point of view M. Picot ranks this assembly of 1560 far below that of Tours; but he gives it high praise for its vigorous spirit of reform, and for the bold and practical propositions contained in its *cahiers*. Amongst its characteristics is a zeal for education which might gladden the heart of a School Board. From some of the nobility came a demand for the compulsory education of the poor; while the Third Estate was further anxious that the advantages of learning should be extended to the higher classes. The reasons it gave were not altogether flattering:—"Est à croire que les impressions et torts qu'endurent les gens du tiers état de la noblesse, procèdent spécialement d'ignorance." For which cause His Majesty was supplicated to see that the nobles were trained to arms and instructed in letters, that they might know their duty towards God, the King, and his people, "en quoi ils se trouveront plus capables à faire service audit seigneur et son royaume, plus traitables et raisonnables envers leurs sujets." In short, the *tiers état*, like ourselves nowadays, saw the necessity of educating its masters. We would not insult the British working-man by comparing him with a French aristocrat, but we may be permitted to hope that the Education Act may in the future render him "plus traitable et raisonnable."

At the close of the work M. Picot examines the causes of the failure of the States-General, and apportioning to the King and the three orders their respective shares of blame. The political conduct of the nobles, on whom a large part of the responsibility falls, he contrasts, much to their disadvantage, with that of the nobles of England, omitting however to notice the main point of difference—that the English nobility was not, like the French, a caste. A narrow class spirit could hardly fail to develop itself in an aristocracy constituted as was that of France. In the States of 1614, which were characterized by the marked antagonism among the orders, this spirit came out in full strength. Savaron, one of the most eloquent members of the Third Estate, ventured to intimate that too heavy burdens, joined to the tyranny of the great, might produce revolt. This forecast of the Revolution was resented by the nobles; and another speaker, De Mesmes, whom the *tiers* had sent to carry its complaints, not its excuses, to the nobility, added fuel to flame by comparing the Three Estates to three brothers, of whom the clergy was the eldest, the nobles the second, and the *tiers* the youngest; further observing that sometimes it came to pass that families ruined by the eldest were restored by the cadets. Absurd as it may seem, this assertion of brotherhood was felt as an insult of which the patricians thought it necessary to complain to the King. Their spokesman, De Senecey, asked with pathetic indignation how they could have fallen so low that the vulgar claimed fraternity with them. Enraged aristocrats were heard exclaiming, as they left the audience, that they would not have the children of shoemakers and cobblers call them brethren—there was as much difference between them and the *tiers* as between master and valet. No wonder that, when the youngest brother whose claim to kindred was thus scornfully rejected had at last become lord over his elders, he proved no merciful conqueror.

We cannot undertake here to follow M. Picot throughout the interesting examination both of what the States-General did and of what they failed to do with which he concludes his task. It is to be feared, however, that the result of his labours may be to confirm English readers in the general belief that Frenchmen, with all their noble qualities, have been smitten by the fates with an incapacity for self-government—a view which the learned author deprecates, even while confessing to the ill success of the States-General:—

Il faut laisser également de côté les apologistes enthousiastes des États qui, voyant dans le passé le modèle exact de nos institutions parlementaires, veulent y retrouver jusqu'aux formes des gouvernements modernes, et les détracteurs également passionnés qui prétendent tirer des querelles du passé la preuve de l'impuissance de notre race. Loin de nous ces deux excès: oui, il est incontestable que les États-Généraux n'ont jamais été une institution régulière, dont le rôle dans la monarchie ait été ni fixe ni déterminé. Mais, si ces assemblées ont traversé notre histoire comme de brillants météores, elles ont laissé des traces lumineuses, elles ont donné des impulsions fécondes; ainsi que ces étoiles qui ont guidé dans la nuit les pasteurs de la Judée, elles ont été pendant trois siècles la consolation des faibles et l'espérance des opprimés.

LATIN HYMNOLOGY.*

THE accumulated wealth of English hymnology owes its strength and solidity, if not its very origin, to appropriations from the Latin. Whatever in the former is compact in

* *The Latin Year: a Collection of Hymns for the Seasons of the Church, selected from Medieval and Modern Authors.* Part I.—Lent and Easter. Part II.—Ascension and Whitsunda. London: B. M. Pickering. 1873.

Hymnologia Christiana Latina: a Century of Poems and Hymns and Spiritual Songs, translated into Latin Verse. By the Rev. Richard Bingham, M.A. Oxon. London: Baillière, Tindall, & Cox. 1871.

form, forcible and telling in expression, and calculated to cling to the memory, will mostly be found traceable, directly or indirectly, to the early or mediæval Latin hymnists. Although, till the appearance of Archbishop Trench's *Sacred Latin Poetry* in 1849, the mass of even our English clergy were but half alive to the existence of this debt, it is by this time recognized and acknowledged; and not only so, but the debt has been considerably increased by the borrowings of Dr. Neale, and of the compilers of *Hymns Ancient and Modern*, both in their original issue and in the now popular Appendix. Moreover, the attention thus called to Latin hymnology has borne fruit, amongst other results, in leading scholars to go themselves to the originals as preserved in the pages of Daniel and Mone, and in encouraging some of them to amuse their leisure with the converse process of reducing the most popular of our English hymns to old Latin shapes and forms. A sample of each fruit is before us in the *Latin Year*, two instalments of which have lately been issued from the classic press of Mr. Basil M. Pickering; and in the *Hymnologia* of Mr. Richard Bingham, a descendant of the author of the *Antiquities of the Christian Church*. The first is a handy and exquisitely got up selection of appropriate Latin hymns, or translations of English hymns into Latin, for the private use of those who find "in the long-neglected sweetness of the rhyming Latin, as in strains of solemn music, a direct source of religious feeling." The second is a wider and less definite attempt to render into Latin metres, classical, early Christian, and mediæval, quantitative, accentuated, and rhyming—in short, Ovidian, Horatian, Prudentian, Buchananian, and monkish—the verses of Doddridge, Watts, Wesley, Hoher, Keld, Montgomery, and a host of other writers of sacred songs. Both volumes have a good aim, and deserve sympathy and interest; but we are mistaken if scholars and Churchmen will not be much more drawn to the former than to the latter, inasmuch as it appeals to them by its simplicity and neatness, and—saving in a number of sore misprints—by the taste and good judgment shown in its editing. Mr. Bingham's work partakes of a subjectiveness which is evidently his ideal in hymnology, but which is distinctly alien from the spirit of the Latin hymns; and this tends to make him select examples of this character for translation, and fall into great diffuseness in converting English into Latin. We doubt whether his versions will, even to scholars, put in an abiding claim to be read in competition with the originals, or indeed whether the good of them will not have been confined for the most part to the pleasant solace and pastime which they have afforded to himself. At the same time it would be unfair to deny that they prove him to be a man of cultivation and taste, with a good store of past research and scholarship to draw upon; though it seems to us that he puts himself in a false position at the outset, when in his introduction he hopes that "young boys or girls" (for it seems he sings "*virginibus puerisque*") may in his versions "have some of the Horatian versification without Horace, and learn much of the Ovidian muse while strangers to Ovid." In the first place, we do not see the reason for such a hope; in the second, we think that the very fact that he confessedly has had to engraft and inlay words, thoughts, and phrases of Christian poets into these substitutes for Ovid and Horace might have suggested a misgiving of the hopefulness of such a task; in the third place, we contend that the rhythms of Prudentius, which Mr. Bingham holds cheap beside the Augustan poets, and even more the rhymes of the patristic and mediæval hymnists, are better adapted to inspire and cherish religious feeling, and to convey the spirit of sacred song. We shall pass first in review some features of the *Latin Year* (confining our notice at present to Part I.), in connexion with its selections from mediæval sources; and then glance at the two Latin reproductions which the editors borrow from modern translators, and which constitute a point of contact with Mr. Bingham's work.

Beginning with Ash Wednesday, the editors offer us a choice between a hymn of somewhat later age, beginning "*Jesu quadrage-narie*," and the famous "*Dies Ire*," commonly attributed to Thomas of Celano, of which the vivid trochaic dimeters have, in the originals and in translations, attained so wonderful a popularity. It is in speaking of this hymn that Daniel, in his *Thesaurus*, mentions the conversion of a King of Bulgaria by the mere sight of a picture of Christ judging the quick and dead, and asks what wonder "*quod noster hymnus cum extremi judicii imaginem tam vere depingat, ut tuis tibi oculis intueri videaris, otiam nunc homines Christianos totus ad se rapiat, et in summam excitet admirationem?*" The same compiler cites the use of this hymn to arouse the conscience and stir up compunction by Goethe in *Faust* and in Kerner's poem of the "*Mad Brothers*." We may perhaps be allowed to regret that, immediately before the last two verses of the hymn, a memorable stanza has been omitted in this version:—

Inter oves locum præsta,
Et ab hædis me sequestra,
Statuens in parte dextra.

For the First Sunday in Lent we have the rhyming hymn attributed diversely to St. Bernard of Clairvaux, Jacobus de Benedictus, and Walter Mapes, Archdeacon of Oxford, but shown by Daniel to be certainly not the work of the first-named:—

Car mundus militat sub vanâ gloria? &c., &c.

In Daniel's copy two stanzas follow the second of those which appear in the text before us, enhancing the "*contemptus mundi*," which is the burden of this hymn, by the inquiry what the characteristic attributes of the representative men of ancient sacred, and profane history have profited them in death? These,

though graphic enough, are perhaps judiciously left out in a volume intended for the closet and for devotion. The burden of them is something like this:—

Say where is the wisest of kings and of men?
Or Samson, whose prowess no age saw again?
Where Absalom's fair face, so rich in its charms,
Or Jonathan's sweetness? Death each one disarms.
Why look we for Caesar with glory erect?
Or Dives, the glutton, in fine robes bedecked?
The sweet voice of Tully, which ruled men of yore?
The master of Reason, why leads he no more?

For the Third Sunday in Lent is given a very remarkable Latin hymn in rhyming eights and sevens, beginning "Iluc ad jugum Calvario." It attracted the critical eye of Dr. Neale, and so has been made available for English readers by his translating hand (see *Mediæv. Hymns*, pp. 220-2, Neale). We should like to quote from both Latin and English, but must give a preference to a hymn of the same character and date, the first for Holy Week in this collection, which begins "Exite filiæ Syon," pp. 22-4. This, too, has been translated by Dr. Neale, and two stanzas of it are noteworthy, the one for the mediæval conceit that underlies it, the other for an example of how readers may be perplexed by careless printing. Let us first cite stanza 3, with Neale's English:—

Ejus corona splendet,
Sed est contexta rubo,
Et gemmæ, quot intermicant,
Nascuntur mari rubro.
Scintillant sicut facule,
Nam sunt cruoris macule.

It glitters fair, his diadem,
But thorns are there entwining:
And from the Red Sea comes each gem
That in its wreath is shining.
Their radiance glows like stars at night:
With precious blood-drops are they bright.

NEALE, *Med. H.* p. 218.

And now for the fifth stanza, which shall be given as it stands in p. 73 of the *Latin Year*:—

Festiva regis purpura
Quam radis manus finxit,
Calonis est lanercula:
Non cocti vermis tinxit:
Qui dixit Ego vermissum
Cruore tinxit coctinum.

By the light of language it is easy to see this is not all right; but by such light alone it would be guesswork to propose emendations. Fortunately Daniel's text gives us for *lanercula* the diminutive "*lacernula*," and for *vermissum* "*vermis sum*," an allusion to a well-known psalm. Dr. Neale's version affirms the corrected text:—

The festive purple of the Lord
Is here no garment stately;
A vest by very slaves abhorred,
The worm hath tinged it lately.
"I am a worm," of old said He!
And what its toils have tinged ye see!

For another day in Holy Week we have that noble hymn of St. Thomas Aquinas beginning "Pange, lingua, gloriosi corporis mysterium," which is adequately represented in English by the Compilers of *Hymns Ancient and Modern* (No. 203), and by Dr. Neale, *M. H.* 178-80. For the Fourth Sunday in Lent we have the hymn "Jerusalem Luminosa," akin in tone to the famous "Urbs beata Hierusalem" of the seventh and eighth centuries, with which we are all more familiar. For Good Friday there is a choice between "Patria sapientia," a devotional office for the different hours of the Crucifixion, of the date of the twelfth century; "Salve mundi salutare" (36-9), a part of which is to be found in St. Bernard's "Oratio Rhythmica"; and another touching hymn, preserved by Mone, which commences "Plange Syon filia." Easter Day has its appropriate choice in the octosyllabic couplets beginning "Surrexit Christus hodie," rendered by Neale (p. 166), and a fourteenth-century hymn of French origin, beginning "Cedant just signa luctu." Nothing could be better than both; but it is a pity that in the second verse of the fifth strophe of the former—

Album videntes angelum
Annunciant gaudium. Allelula—

there is a gross misprint. On referring to Daniel we find that one reading, and that of most copies, is *annunciant gaudium*, for which in his fourth volume he suggests reading *annunciantem*. The editors of the *Latin Year* have printed an impossible compromise between one and the other. Neale translates rightly

An angel clad in white appears
To bring glad tidings to their ears.

To show how much depends on accurate printing, we may point to the last line but one of the hymn "Cedant just signa luctu" which follows the last mentioned. Here the mere division of a compound word into the preposition and noun of which it is made up creates utter nonsense, as will be seen when we say that the singers of the hymn, instead of invoking the Saints, "Nobis adjumentum esto," are made to bid them "nobis ad jumentum esto," which must surely mean that they should convert themselves into horses or asses (see p. 50). We have reserved for mention till this point the hymns for the Fifth Sunday in Lent and for Easter Eve, because the first is a modern version of Dr. Watts's "When I survey the Wondrous Cross," and the other Mr. Gladstone's rendering of Toplady's "Rock of Ages." In the case of both we can compare two alternative versions. From the first we select a

verse (No. 3) of quite Latin compactness, so to speak; and one which seems to invite the same excellence in translation:—

See from His head, His hands, His feet,
Sorrow and love flow mingled down!
Did e'er such love and sorrow meet,
Or thorns compose so rich a crown?

For this we may choose between the rhyming eight syllables of the *Latin Year*, the Asclepiadean and Glyconic metre (used in the Sixth Ode of Horace, Book 1, and in some cases by Prudentius), which has been applied to this hymn by the Rev. C. B. Pearson, author of a scholarly volume of hymn translations in 1862, and lastly Mr. Bingham's version, we should rather term it paraphrase, in rhyming eights and sevens. The race is between the first and second, as will be agreed by those who read the competitors in order:—

En de manu, pede, fronta,
Amor dolor manant fronte.
O amoris dolor finis!
O corona pulchra spinis!—L.Y.

Sacras ecce manus, et caput, et pedes,
Aspergunt Domini vulnera sanguine;
Nunquam tot miseras novit amor vices,
Tot spinas diademata.—P.

En ut de sacris manibus
De capite, de pedibus
Mæror et amor exeunt!
Quando fuit talis mæror,
Atque una tantus amor
Quæ Crucifixio deluunt?

Tibi nam corona qualis
E spinis fit? ut nulla talis
Argentea vel aurea!
Nulla hominum corona,
Nullæ gemmæ, regis dona,
Ut tua, Christe, laurea.—B. p. 172.

While the first of these realizes the mediæval rhyme and manner to a nicety, the second goes back a stage or two towards the classical ideal, whereas the third is overwrought to prolixity, which we are constrained to say is the fault of many of Mr. Bingham's versions. It pervades his version of the Old Christmas Hymn "When shepherds watched, &c.," the first verse of which is spun out into nine lines of rhyming Latin, though among the necessary importations into the translation there is one which must be noticed on its own account. We need not quote the English stanza, but will our readers consider particularly the italicized words in the Latin which follows?—

Oves dum custodientes
Omnes humi consistentes
Pastores noctu vigilant,
Dei angelus in celo
Apparet, absente velo,
Et flammæ lucis emicant.

Will some one help us to the meaning of "absente velo," which is clearly superfluous? Did the angel come down "without sails," a negative way of expressing "remigio alarum" "on oary pinions"; or does it mean that he was "undraped"? We are not responsible for the grotesque ideas which such freaks of translation provoke.

Both Mr. Bingham and the Rev. C. Ingham Black contest with Mr. Gladstone the palm of a successful rendering of "Rock of Ages" into Latin. But here, too, a comparison of the different renderings of four lines of the first stanza will establish the Premier's victory over the worthy rival whose version we owe to Mr. L. Coutier Bigg's *Annotated Hymns, Ancient and Modern*, as well as over the discursive translator who spins them out into six diffuse elegiacs:—

Let the water and the blood
From thy riven side that flowed
Be of sin the double cure;
Save from wrath and make me pure!

Tu per lympham profluentem,
Tu per sanguinem tepentem,
In peccata mi redunda,
Tolle culpam, sordes munda.—G.

Lympham, sanguinem sacratum
Fudit Latus perforatum.
Huc dent binas medicinas,
Cor eluant, frangant minas.—B.

The short third syllable in the last line offends the ear, although we know that quantity is here a secondary matter. But let us see Mr. Bingham's elegiacs, and give him the benefit of the variant last line, "Cleanse me from its guilt and power":—

Da veniam, laterisque Tui qui vulnere flassi
Sanguis abundavit, lymphæque pura simul,
Et sonti et misero duplici medicamine prosit,
Peccati percant culpaque visque mei
Te purgante meum cor crimine, dulcis Iesu,
Te parente mihi, Te renovante tuum.

Here in fact we have what, in his preface—contrasting unfavourably the patristic and mediæval hymns with the unction and spiritual joy of our Evangelical poetry since the Reformation—Mr. Bingham would call "the freer atmosphere of the subjective system," in its natural fruits—to wit, a surplussage of words, which in sacred song or prayers is better avoided. There is far too much of it here, and the charm which invests sacred Latin song in its best models is frittered away in vain repetitions. Were it possible to go more into detail, we could show that Mr. Bingham's Latin expressions in classical translations are not infrequently such as neither Horace, nor Ovid, nor Prudentius, would have used, and we can scarcely acquit him of presumption in turning "Jerusalem the

Golden" into hexameters and penthemimers, so as to provoke comparison with St. Bernard of Morlaix, from whom it is translated in the first instance. One has heard of the Welsh parson who turned Tillotson's Sermons into Welsh for his Welsh congregation, and back into English for his English hearers, with such disguising in the process that the latter never guessed the piracy. The best part of Mr. Bingham's book is his preface on metres. For the rest it will perhaps have achieved its best end in affording him a pleasant mental recreation. The *Latin Year* is a book of far more interest and usefulness, and may be expected to find a place in the library of every lover of Latin hymnology.

META HOLDENIS.*

M. VICTOR CHERBULIEZ is one of the ablest of recent French novelists. His stories, indeed, are of varying degrees of merit, and it must be admitted that they have one fault not common amongst his countrymen. They hardly show that singular felicity of construction in which most Frenchmen so hopelessly distance their clumsy English competitors. M. Cherbuliez does not always tell his stories well; the action is frequently slow, and he is apt to describe his characters from the outside instead of making them living and moving realities, capable of explaining themselves. Moreover he frequently has recourse to rather awkward devices in order to bring his personages into the desired situation. For example, we could cite from nearly all his novels instances of the clumsy expedient by which one of the actors is placed in a closet or behind a door and overhears an important conversation. On the stage this old-fashioned device may be pardonable, owing to the necessary limitations of dramatic composition. But in a novel, with its unlimited freedom of arrangement, we expect the author to be capable of betraying the intentions of one performer to another without forcing them into a situation which occurs so rarely in real life. These faults may probably be explained by saying that M. Cherbuliez is rather a novelist of malice prepense than a novelist by nature. He has made up his mind, and doubtless for sufficient reasons, to use this form of art; he has not adopted it from the spontaneous impulse of the genuine storyteller. His contributions to other forms of literature show sufficiently that he is a man of widely cultivated mind, as well as of great powers of thought and language. When, therefore, he writes as a novelist we are always more or less sensible of the effort of a writer who has adopted a channel of utterance not quite the most natural to himself. But, in compensation, we are also sensible of the rare pleasure of listening to a man who is not a mere novelist, but a reasoning and reflecting animal. Some of his novels, though spiced by horrors rather too strong to be agreeable, are very striking performances. The *Aventure de Ladislav Bolaki*, for example, is a vigorous portrait of an impetuous Polish patriot, who is almost as impulsive and as feeble of will as Rousseau himself, and who falls a victim to the fascinations of a Russian charmer. The catastrophe verges upon the melodramatic; but the force with which the situation is worked out is very remarkable. In the *Revanche de Joseph Noirel* again, another tragedy, perhaps too painful for art and apparently founded upon real life, is contrasted by a singularly vigorous description of the trivialities of middle-class life in Geneva and a striking portrait of the genuine working-man with his cleverness, his conceit, his impulsive generosity, and his underlying selfishness.

Meta Holdenis, the author's most recent production, is free from the darker shades of these stories, which, we confess, are to our taste, rather too dark. It is not less conspicuous for satirical power; and the story—though here, too, we have the inevitable closet scene—is ingeniously devised and told with abundant spirit. It is, in fact, to our mind the most genuine novel which M. Cherbuliez has yet produced; and the reason is probably that it is written under the impulse of strong feeling. No moral, indeed, is explicitly drawn; but the general design is transparent, and probably contributes, as well as the intrinsic merit of the book, to the success which it has gained in France. M. Cherbuliez is one of the few writers in French (he is by birth a Genevese) who really know something of Germany; as he showed in the remarkable study of German politics which startled France just before the war, and in two excellent essays upon Lessing and Strauss as representatives of different phases of German thought. His knowledge, however, has not been productive of love. M. Cherbuliez evidently shares the patriotic sentiment of the country whose language he writes; and French patriotism just now implies a view of the German character which Englishmen are less likely to share than to understand. Now *Meta Holdenis*, the heroine of the present volume, is a typical German, as Germans appear at this time in France. M. Cherbuliez's portrait has evidently been executed with thorough enjoyment. That it is a fair portrait of actual German tendencies we do not of course undertake to say; indeed it is our private opinion that it would be a gross libel upon the German people to make any such statement; but luckily that question is perfectly irrelevant to the merits of the novel. Nor does M. Cherbuliez say explicitly—though we venture to suppose that his readers will add for themselves—that such ladies as *Meta Holdenis* are at all common amongst the Germans. In one sense, indeed, they are uncommon everywhere; for *Miss Holdenis* is what the police reports describe as a young lady of

unusual personal attractions. She has the power of exercising a strange fascination upon every one with whom she comes into contact; and, if not regularly beautiful at first sight, she makes up for any defects by intellectual endowments of a very high order. As an adventuress in the position of a governess, *Meta Holdenis* reminds us in some respects of *Becky Sharpe*; but to improve the parallel we must imagine *Miss Sharpe* to have been brought up at the feet, not of a disreputable old Bohemian, but of a kind of commercial *Pecksniff*. She has learnt to talk a sanctimonious dialect instead of indulging in *Becky's* scornful frankness; and, had she been placed in the appropriate position of life, could have written proclamations avowing her thankfulness to Providence whilst calmly appropriating her neighbour's provinces. *Tony Flamerin*, the imaginary author of the book, first makes her acquaintance at her father's house, where, like *Charlotte* in the *Sorrows of Werther*, she is cutting up bread and butter for her little brothers and sisters. "You keep nothing for yourself!" says her father with unctuous affection; and to her adorable reply he answers emphatically, "Allesliebst!" This excellent father afterwards reads prayers from a folio Bible, and improvises a sermon from a text in the Apocalypse. *Tony Flamerin* is greatly impressed by this patriarchal simplicity, and is seized with a passion for the young lady. The father presently borrows from him, purely for his own good, a sum of ten thousand francs, which happens to be his whole available capital. As the venerable person becomes a bankrupt a day or two afterwards, paying the smallest of dividends to his creditors, *Flamerin's* eyes are pretty decidedly opened to his character; and, another incident happening to unveil *Miss Holdenis's* true designs, he very judiciously beats a hasty retreat.

This little history is merely a prelude to the more important theme. *Meta* is next revealed to us as governess in a family with which her old friend *Flamerin* is intimate. Her position is slightly awkward for so straitlaced a person. *M. de Mauserre*, the gentleman in whose house she is staying, is a retired diplomatist of distinction. He is still in the prime of life, and capable, as he thinks, of taking part with credit in the great game of politics. Unluckily, the lady with whom he lives, and to whose daughter *Meta* is governess, is not his wife, and the scandal given by this connexion is the reason for his retirement from public life. He has indeed, we are told, every excuse which such conduct can admit. The husband of his mistress is a brute who has given every possible cause of complaint to his wife, and who refuses to agree to a divorce simply out of spite. *Meta*, who has come into the family without knowing its history, consents to remain because, as she says, she has become so profoundly attached to her youthful charge. Gradually, however, symptoms appear which cause great anxiety to the little circle of friends. *Meta*, who has begun by charming everybody, gradually begins to exercise a special fascination over *M. de Mauserre*. She always professes the most admirable religious principles; and it appears to lookers-on that she is about to adopt on the highest possible grounds a line of conduct which has more obvious recommendations to the worldly. Suppose, in fact, that *Meta* were to marry *M. de Mauserre*, she would be breaking off an unhallowed connexion, and restoring a man of eminent ability to his due position in the world. At the same time, of course, she would be making an excellent match; and naturally *M. de Mauserre's* relations do not admire this attempt to reconcile the worship of God and Mammon. People will often take widely different views of the same transaction, and it is possible to convert the story of *Meta* and *M. de Mauserre* into an allegory representative of a game played out on a larger scale. In fact, she may stand for the King of Prussia before the war, desiring from the most purely patriotic motives to induce the provinces now annexed to the Empire to desert their unhallowed connexion with France. Whether the analogy was present to the mind of *M. Cherbuliez* is more than we can say; but *Meta* certainly represents the ambition covered by a veil of hypocrisy which is sometimes held to be characteristic of the national politics. The satire may be animated by this antipathy, but the novel is not perverted by any allegorical design. *M. Cherbuliez* throws himself into the situation, and works out the character and the designs of *Meta Holdenis* with admirable spirit. The quiet young German, in spite of her home education, is quite shrewd enough to make a fool of the worldly-wise diplomat. It is not the first time in history that an experienced man of the world has been effectually hoodwinked by a beautiful and designing young woman, and *M. Flamerin* would have ample materials for the book which he proposes to write *De la bêtise des hommes d'esprit*. The description of a designing young woman is by no means an easy task; and many writers of no mean skill have fallen into the error of charging their colours too highly. *M. Cherbuliez*, therefore, deserves great credit for the skill with which he represents *Meta*, as not only deceiving herself into a belief in her own virtues, but as exercising a considerable fascination even upon those who have seen through her artifices. We sympathize with *Tony Flamerin*, who cannot help being a little in love with her at the very time when he is trying to counterwork her plots; and we have a kind of suspicion that, if the fates had been kinder, she might have made a very excellent heroine after all, or, at least, have never been found out by herself or others. If *Becky Sharpe* had married a man with brains, we have sometimes reflected, she might have really led an honourable and distinguished life; and if *Meta* had consented to take the distinguished painter, *M. Tony Flamerin*, instead of being tempted by the wealth and position of *M. de Mauserre*, she might, for anything we see to the contrary, have been a model wife. However, that

* *Meta Holdenis*. Par Victor Cherbuliez. Paris: Hachette & Co. 1873.

could not be in the interests of the novel, and accordingly a different catastrophe is reached, the nature of which we need not reveal. If our readers like to study a very excellent specimen of the modern French novel, they will find it out for themselves. Meanwhile we shall be content to say that, putting aside the national reflection, *Mata Hoddense* is a story of great intrinsic merit; and, if M. Ochorulicz has not succeeded in adding an entirely new variety to the great family of Pecksniffs and Tartuffes, he has certainly described his heroine with so much vivacity as to make her stand out in our memory far above the ordinary run of stock characters in fictitious literature.

SCHERFF'S PEACE TRAINING OF ARMIES.*

THE second part of Major Scherff's work, which appeared in Colonel Graham's English version almost as soon as in the German, presents, as our heading shows, a far wider subject than the first which we recently reviewed. Here again, indeed, the author applies himself almost wholly to the improvement of the one arm which gives the title to his book. But it is hardly possible to treat of the peace training of infantry without indirectly raising questions which concern the other branches of the service. And, without attempting to deal with these either dogmatically or with any completeness, Major Scherff contrives to let his opinions be known tolerably plainly. On cavalry at any rate he expresses, though gently, his deliberate view that the desire which has recently arisen among German officers of that arm for gathering and practising great masses of horse together—a desire which has evidently led to the exercises of two complete divisions just about to meet under Prince Frederick Charles in the Duchy of Anhalt—though a natural reaction from the marked tendency of the war, after the first few actions, to scatter them into mere fractions, is founded on no sound military principle. Cavalry is digging its own grave, he says, in hoping to recover that influence in battle of which the rapidity and accuracy of the breech-loader has robbed it, by taking advantage of the new looseness of formation; for the notion that it can ever again be able to break into the enemy's infantry, however apparently scattered, with the sweeping effect of days gone by, is but a dream. We agree most fully with the author in this, and have purposely gone out of our way to put his opinion on this point before our readers, because plain speaking on this head is at least as much needed with us as in Germany, since in England, as well as there, the arm which is favoured of the aristocracy is apt to be allowed its own way more than is wise. But we must pass now to the main subject of the work.

Those who imagine—and we fancy that a majority of readers are on that side—that the tactical performances of the German infantry in the war left so little to be desired that further improvement can but be the dream of a military enthusiast, should read carefully, as a sort of preface to that which follows, what is said by this trained and practical eyewitness of the result of insufficient peace practice as displayed in the first actions of the late war. We follow nearly Colonel Graham's version:—

We saw our infantry often rushing headlong to the charge without giving our artillery sufficient time or opportunity to prepare the way. Great bodies of troops trickled away into action before completing their march into line of battle. Detachments standing or fighting side by side made their attacks independently of one another, instead of in combination. Comparatively weak bodies—advanced guards, for instance—assumed an extension of front far more than commensurate with their strength. Separate battalions, companies, even at last subdivisions, breaking away here and there from their parent stem and seeking each its own way, doubled in, attacked, made turning movements, pursued "each on its own hook," until utterly breathless, and with all their ammunition expended, they found themselves at opposite sides of the battle-field.

The very fact, Major Scherff adds, that faults of this sort were less frequent as the war went on, and as the infantry acquired on the battle-field the methodized manner of action in which it was at first deficient, is the strongest reason for insisting that such improvement should not be left to be made in war. Nor will the experience gained in the late struggle suffice, in his view, to keep the army fully up to the mark of supreme excellence. Personal experiences are (here he instances rather sharply a loose passage of the *Tactical Retrospect*, often criticized before) but an unsafe guide for good general training and the avoiding of erroneous doctrine. The only way to be sure in such a matter is to have for your peace practice precepts founded on the wants of war. *Battle, as it is now*, should be the chief object of the training of troops in time of peace.

This discussion brings our author naturally to the reform which he proposes. And this concerns no minor points of organization or drill. It can hardly be said to be even technical. It rests for its support mainly on the proper conditions of that which the writer has treated so elaborately in his first part—the handling of troops under actual fire in the determined attack or defence which forms the crisis of a decisive action. To prepare infantry for this tremendous effort, to train them so that the whole exertions of each individual shall be used to the proper end, and that consequently the combined power of the mass shall be employed to the greatest possible advantage—this is no trifling task to be thrown incidentally into the midst of other labours. It must be worked out individually, in the company and in the battalion; it must be

practised on varied ground and under different circumstances; and every man must be brought up to a certain standard of excellence, if it is intended that no chance of success should be thrown away when the real tug of war comes.

Now, to do this thoroughly, Major Scherff goes on to argue, is quite as much as can be expected to be done with an average recruit in the time allowed—that is, of course, within the short term of service originally adopted in Prussia, but which is becoming the rule all over the Continent. For, in order to prepare your fighting machine properly, he proceeds to point out, the very least requisites are that the individual soldier must gain three advantages. He must be brought into perfect discipline, not forgetting that gymnastic training which is to give him full command of his own limbs. He must be thoroughly familiar with the use of his weapon, including that of the bayonet, which, for its moral effect at least, continues to be very formidable. And he must know how to take advantage of the ground on which he is placed; not indeed by that sort of taking cover which was taught to the skirmisher, strictly so called, of the past generation, but that proper for the "extended order" of masses of men who use the ground without ever allowing its formation to interfere with the object in view. In not recognizing this difference, he it observed, lay the one great error which led to the ill-directed tactics before described. But the three qualities thus enumerated are in their nature essentially those of the individual. They by no means complete the education of the soldier, who is after all but a part of a machine, mobile and loosely put together though that machine may have become in the process of change which the art of war has lately witnessed. As such part, the soldier must give his aid in the perfection of the machine itself in its essentials, and these essentials again may be summed up as three. Bodies of soldiers must have the power of moving in good order, of readily exchanging one order for another, and of preserving "fire-discipline," or disciplined conduct under fire. That instinctive discipline for which the old Prussian army was famed is here spoken of as the last condition—a discipline which, dating from the days of Frederick, has insisted on the essentials of order being preserved even when the excitement of combat tends to take off the mechanical pressure of command. As the author formulates this demand:—

The one and only actual method of fighting, with all its requirements, many of which are still so new or at least unfamiliar to us, even those of a purely formal character, as different movements and modes of firing (when closing to the attack), must be made a second nature. Who [he adds] will fail to comprehend that here is the field in which we can and must spend a great part of the time which may be spared from other work?

If to this training he added a general acquaintance with ordinary outpost duty of the most simple character, infantry will be produced equal to every call which may be made on them in the course of the greater operations of war. Everything beyond, however desirable, is not strictly necessary, and hence it should not be looked on as such for the great mass of the men of the Line. A class of picked men only, selected from each year's contingent at the close of the year's training and after their first set of autumn manoeuvres, for quickness, intelligence, and zeal in their professional duties, should be trained in every company to the higher and special duties of field service, as patrols, and other parts of what are known as "the minor operations of war," as leaders of other skirmishers, and as ready assistants to the engineer when his services are called into action. The details necessary for these objects Major Scherff declares to be beyond the scope of his work. What he desires to do, as his translator expresses it, is "to knock on the head the idealistic principle of universal perfection," and especially to substitute for the elaborate *Felddienübung*, or Field Service Practice, to which attention had been so constantly directed before the war, a thorough training in the actual exigencies of the "decisive action," as distinguished from the less important and comparatively rare minor affairs which he calls in his first part the "temporizing" or "demonstrative" combat. It has been the effect of past training, given almost wholly to the latter, to confound the idea of battle with that of the field exercise magnified; whereas the new extended order in which bodies of troops enter into decisive action is really, he pointedly declares, a totally different thing from the use of skirmishers extended widely after the old fashion for merely demonstrative purposes. The confusion between the two led to the mistakes before complained of, and "at the decisive moment the really needful was wanting, in spite of individual perfection."

Now we are far from saying that, supposing Major Scherff to be right, and the present training of the German army to be as much in need of reform as he considers it, therefore the same remarks would apply absolutely to our own. Unhappily the comparison can hardly be made at all with fairness; for our present system of recruiting, which consists in buying at an inadequate price the very lowest class of unskilled labour in its raw youth, and attempting to retain it under the pressure of a Mutiny Act, and to lick it into shape by stringent discipline, can give us but very little of that stratum of superior intelligence which is found largely in the German army, in the sons of the lower middle classes and well-to-do peasantry, who cannot afford the genteel service of the *Einjähriger*, and so are compelled to do the regular term of three years' duty in the ranks. But this is all the stronger reason why we should avoid the error against which Major Scherff is warning his countrymen, of attempting too much with the ordinary recruit. The fancies of War Office soldiers who never leave their desks and know nothing of the human material they legislate for, and, still

* *Studien zur neuen Infanterie-Taktik*. II^{ter} Theil. (Studies in the New Tactics of Infantry, by Major von Scherff, of the Prussian General Staff. Translated by Colonel L. Graham. London: Henry S. King & Co.)

more, of those members of Parliament who dabble in military matters for want of some other speciality, have of late had a pernicious influence among ourselves in this direction. We teach our young soldiers their drill, as is of course necessary. We send them to school to pick up "the three Rs"; and few will dispute the propriety of this recent addition to their military education. But when, in addition to this, and to an individual training with their weapon in a course of musketry which is nowhere surpassed, we superadd attempts to make of each man an artisan, a field engineer, and, as some would have him, a gunner; when we organize in each of our small battalions a corps of baggage-drivers, of shoemakers, tailors, farriers, telegraphers, and signallers, we are running with the best possible intentions into a double error, fatal to the efficiency of the mass. Some of the teaching that is given will certainly fall utterly wide of its purpose; and, what is more serious, the real training of the bulk of the men as good infantry soldiers is sure to suffer. We are attempting, in fact, to go much further than the Germans with a less pliable material, and the result will only be that the military Jack-of-all-trades, which the poor recruit is to become, if War Office Circulars as to his supposed qualifications are strictly carried out, will inevitably fail to be master of that single craft on his dexterity in which the nation is to rely when her need for soldiers comes. It seems hard, no doubt, to say this in the face of efforts which are really well meant; but every thoughtful soldier among us who has practical knowledge of what is being attempted in this direction is aware that, as Major Scherff's own words put it, the quantity of matter taught to the average soldier is of less importance to his country than its thoroughly good quality, and that we have been forgetting the latter in striving to increase the former.

We could have wished to devote a little space to those chapters on the higher training of officers, and on the extended use and proper form of peace manoeuvres, with which the work closes. They are hardly less striking than that part of the book which we have now noticed, and they have a special interest for us just now, when the questions treated of are coming up among ourselves. Even those who may not agree with the gallant author elsewhere will admit that in his closing chapter on those autumn exercises which we are busily imitating there is not a word thrown away. Even on so commonplace a point as that of the march past his remarks are a model of good sense and sound reasoning, and are so *à propos* just now that we must quote them as a most fitting conclusion. However few working days the manoeuvres allow, he says:—

One should be set apart for the parade of the whole force. Such military displays on a large scale impart, both to the corps and the individual, to a greater extent than is generally supposed, the feeling of holding together, the consciousness of strength, the certainty expressed in the words "there are a great lot of us." They also tell well on the great public, which rarely but on such occasions has an opportunity of raising its spirits by the visible spectacle of the national power. And it is often only by means of these parades that the different arms make each other's acquaintance outwardly, and come to know of one another what is the size of a cavalry regiment, an infantry battalion, and so on; for the private rarely sees these bodies together except on such occasions.

LAYS AND LEGENDS OF THE LAKE COUNTRY.*

IT is rather difficult to speak justly of a book which has failed in its primary, but succeeded in its secondary, intention; which gives, for instance, a dull theme but a lively exegesis; where the original matter is worthless and the extracted matter of value. It is not to be condemned, but neither can it be praised. It is something like the feat of that nursery hero who "shot at a pigeon and killed a crow"; or the winning of a game through a lucky fluke not in the calculations. The good which was aimed at is missed, and that which is hit was not aimed at. *Lays and Legends of the English Lake Country* is this kind of book. The lays which form the ostensible substance and purpose of the work are as poor as anything we have ever read of the nature of rhyme; but the notes giving in prose the stories and legends on which these starveling poems are founded are, as the title-page says, "copious." To be sure they are all well known, and no new light is thrown on doubtful passages; but there is something in the life of a popular legend which bears a great deal of transmission, and no one who loves the old tales at all tires of reading them afresh.

But we must add that Mr. White has taken extraordinary liberties with some of his "roots"; and has produced poetic fruits of an unwarrantable kind. Witness "The Raven on Kernal Crag," where he has transformed a pretty little bit of natural history into the description of a raven not so weird as Poe's, and just as improbable. Because a pair of ravens annually built their nest on Kernal Crag (Conistoun Old Man), and, though their young were frequently destroyed by the shepherds, always returned to the same spot; because, when one of the parent birds was killed in the brooding season, the survivor got a new mate without loss of time; and because once, when both parent birds were killed, leaving a nestful of unfledged young, a couple of strange ravens came out of the sky, and attended to the nestlings till they could forage for themselves, Mr. White has imagined a raven of the prehistoric and volcanic times, who witnesses the worship of Bel and the arrival of the Romans, hears the hammer of Thor and "sees King Dunnal's hosts" go up the hill, watches the knights and

ladies of chivalry, and is now still sitting on Kernal Rock "counting the lambs in a mountain flock." He seems to be a feathered and stationary brother of the Wandering Jew, if we are to believe his biographer:—

That Raven will sit upon Kernal Rock
Till the mountains red in the world's last shock.
Till the new things come to end like old,
He will roll his eye, and his wings unfold,
And settle again; and his solemn brow
Draw close to his shoulders, and muse as now.

In his notes to "The Luck of Edenhall" Mr. White gives a word on the great centenarian question. In speaking of the old oak on Wragmire Moss, known as "the last tree of Ingleswood Forest," which fell in 1823 of sheer old age—as it was said to be between seven hundred and eight hundred years old, the cause of its fall was not to be wondered at—he says:

On the same day on which this tree fell, Mr. Robert Bowman, who was born at Ilkington, in 1705, died at Irthington, at the extraordinary age of 117 years and 8 months, retaining his faculties till about three months before his death. He lived very abstemiously, was never intoxicated but once in his life, and at the age of 111 used occasionally to assist his family at their harvest work. The last forty years of his life were spent at Irthington, and in his 109th year he walked to and from Carlisle, being 14 miles in one day.

Then he goes on to give the story of a local Old Parr, which we confess we receive with the customary grain; we should prefer a rigid investigation of registers, and a considerable allowance made for possible errors, to an acceptance pure and simple of this marvel of longevity:—

The most remarkable instance of longevity in a native of Cumberland is that of John Taylor, born at Garragill in the parish of Aldston moor. He went underground to work in the lead mines at eleven years of age. He was fourteen or fifteen at the time of the great solar eclipse, called in the North *nick Monday*, which happened 29th of March 1652. From that time till 1752, except for two years, during which he was employed in the mint at Edinburgh, he wrought in the mines at Aldston, at Blackhall in the Bishoprick of Durham, and in various parts of Scotland. His death happened some time in the year 1772, in the neighbourhood of Moffat, near the Leadhills mines, in which he had been employed several years. He worked in the mines till he was about 115. At the time of his decease he must have been 135 years of age.

"The Rev. George Braithwaite, who died curate of St. Mary's, Carlisle, in 1753, at the age of 110," is quite a juvenile by the side of these venerable Methuselahs; but we doubt whether Mr. Thom would accept even the Rev. George with as much complacent faith as Mr. White has shown; and whether he would not rather prove that mistake, vanity, and falsehood, all three united, had something to do with the figures, and that the curate of St. Mary's, Carlisle, was not so very far in advance of his fellow-men when the core of fact was reached, divested of its envelope of tradition. The people of the North countries are notoriously long-lived—those at least who are not touched by consumption, scrofula, and rheumatism, which are the deadly scourges of the dales. Given clean blood, and we get remarkable strength of frame and length of days; but we question the list in Lyson's *Magna Britannia*, which gives "144 individuals ranging from 100 to 113 years of age," within a period of 150 years, even though it does give the "date, name, parish, and age of each individual." Those who know how country parish registers were kept in olden times would not pin much faith to even a written record. The clergy of these remote places were men in nowise superior to the peasants they taught, and from whom they sprang. All the Northern men were educated up to a certain point, and not many beyond that certain, or uncertain, point. Grammar schools abound; and up to quite late years the local gentry used to send their sons to these schools, where also the dalesmen and the cotters sent theirs. If, however, the result on the one side was an innkeeper like John Curison of the Plough Inn, Ulpha, who would make out his bill in ~~English~~ Greek, and Latin, on the other it was a race of clergy who thought and drank and swore and raked with the best of them, if it happened that their inclinations led that way; and who, even when of a more respectable private life, were not famed for accuracy in their duties, their "Hoot, mon, niver fash theeself for sic muck" being a ready answer to all remonstrances or inquiry. The notes on "The Church among the Mountains" give several curious examples of the conditions, salaries, and lives of the clergy of the smaller cures. And from material facts we may reasonably infer intellectual ones. Where the life was so rough, there would not be much respect for things in general. Old parish registers mouse-gnawed and moth-eaten, blotted and mildewed, here a leaf torn out and there a date forgotten, are among our own early recollections; and what was to be found in an important parish is even more surely true of the smaller districts.

There is another human marvel reported in the notes to "Gunilda," "a lady of the Lucy family," at Egremont, who was devoured by a wolf. This is the description of the skeleton of a giant which was found at St. Bees, in 1601; but Mr. White does not say where the bones are now, nor can our own local knowledge supply the deficiency. We should like, however, Professor Owen to have a turn at them before we labelled them "correct" according to the inventory:—

"A true report of Hugh Hodson, of Thorneway, in Cumberland, to Sir Rob. Cewell (q.v. Sewell) of a giant found at St. Bees, in Cumberland, 1601, before X^{mas}.

"The said Giant was buried 4 yards deep in the ground, and is now a corn field.

"He was 4 yards and an half long, and was in complete armour: his sword and battle-axe lying by him.

"His sword was two spans broad and more than a yards long.

* *Lays and Legends of the English Lake Country*. With copious Notes By John Pagen White, F.R.C.S. London: J. E. Smith. Carlisle: G. & T. Coward. 1873.

"The head of his battle axe a yard long, and the shaft of it all of iron, as thick as a man's thigh, and more than 2 yards long.

"His teeth were 6 inches long, and 2 inches broad; his forehead was more than 2 spans and a half broad.

"His chine bone could contain 3 pecks of oatmeal.

"His armour, sword, and battle-axe, are at Mr. Sand's of Redington, (Rottington) and at Mr. Wyber's at St. Neos."—Machel MSS. Vol. vi.

Many of the natural curiosities of the Lake country are mentioned in this book, such as the Helm-wind on Cross Fell, and the tremendous inundation in the Vale of St. John's, near Keswick, which happened in the August of 1749, and of which the traces are still to be seen, when a waterspout burst among the mountains, and the mountain ghylls, notably Catchertz Ghyll, swelled and overflowed with such violence that "many houses were filled with sand to the first story, many more driven down, and among the rest Lagberthwaite mill, of which not one stone was left upon another," even the heavy millstones being washed away. Mr. White speaks, too, of the Druidical circle near Keswick; the various strangely fashioned rocks to be found on the mountain sides, such as the Lion and the Lamb, or the Astrologer, or Old Woman, as you see it on Helia Crag (Grasmere), the Apostle's Crag under Barf (Thornthwaite, on Bassenthwaite), one of the most beautiful and least known of these pictured rocks; the likeness of George III. made by the crowning knobs of Causey Pike; the Castle rocks (Lyulph's Tower) of St. John's, known to all readers of the *Bridal of Triermian*; the shepherd dog to be seen on Kirkstoun Pass, coming up from Brother's Water; and others. But none of these are equal in artistic accuracy to the odd Queen Elizabeth's rock at Bedruthan Steps in Cornwall, which at a certain distance looks for all the world like her kingly Majesty as we know her—small head, high nose, big ruff, and bigger farthingale, with the regal crown at the top of all. Among the legends we have the inevitable story of the Borrowdale "gowk," or cuckoo—a story shared by the honest humbling-fools with the wise men of Gotham. We have also the "horned horse," as they are said to have called the straying red deer which got to the top of their fells, probably from the herd on Kidsty Pike and High Street; the peacock, by which name they designated the first mule that ever they saw; the devil in the sack of quicklime, which the terrified bearer threw into the river by Grange when it began to smoke on his shoulders under the shower; and the patient bewilderment of the first man who rode in stirrups, how he sat there by his house-door on his horse, his feet fixed by enchantment till his family came home. Then one among them, a clever lad who had learnt schooling at St. Peter, advised his father to draw his feet out of his boots, and leave the coverings in the vice till such time as they could be removed. For ghost stories we have the legend of the Crier of Ulfe, on Windermere; Hob Thross, the "body a' ower rough," who was fed with milk, and did good work as his payment, and whom another writer on popular legends makes out to have been a skin-clad Druid hiding from his religious pursuers; the haunted house at Arncliffe, and the two witnessing skulls at Old Calgarth; but we hear nothing of the Arncliffe Bogle. The Luck of Edenhall and the less known Luck of Burrell Green, belonging to a yeoman (statesman?) in Great Salkeld, are of course spoken of; as also is the Luck of Muncaster. But if Mr. White wished to give old family traditions, he might have found more than we have in these *Lays and Legends*. Did Caldbeck lie out of his range? It is scarcely a lake-country village, situated as it is on the outside of Skiddaw, to the north, and close to the wide moor; but there are good materials there in the Fairy Howk and the Fairy Lane; while field and farm about have—or used to have—many old and strange histories attached to them. Time, however, wipes these old-world traditions away, and modern time has an especial faculty for destroying them. Unless, then, they are preserved while they are still alive and fresh in the minds of the older-fashioned peasantry, they will be lost altogether. And we know that there are rich mines as yet unworked to be found in the wilder and more desolate moorland districts, like the outlying hamlets between Caldbeck and Carlisle, and in the lone places between Hesketh-new-market and Paurith. It would be a good work to gather them up and add them to another edition of these *Lays and Legends*.

WORK.*

MISS ALCOTT has achieved a task of no little difficulty in writing a book with a purpose so skilfully and delicately that the presence of the purpose is never obtrusive or offensive; while at the same time those who take the trouble to read *Work*, which will repay them well for their exertion, cannot fail to be struck by its meaning, which is peculiarly applicable to the present state of things in England no less than in America. We do not wish to convey the impression that this is a novel with a sermon neatly wrapped up and disguised in its pages; on the contrary, although it expresses the result of serious thought and deep conviction on a question which has been much, we might say too much, agitated of late, it is singularly free from any tendency to sermonize—is indeed neither more nor less than its second title announces it to be, "A Story of Experience." The heroine of this experience is Christie Devon, an orphan girl, whom we find tired of the commonplace life she leads in the New England farmhouse of her uncle and aunt, where she is

surrounded by bluff young farmers and buxom girls whose one ambition is to "get married," and where she can find no sphere for the employment of the better talents which she possesses. Consequently she is on the point of leaving this home, and trying to get on and be of some use in the world by herself. She is the daughter of a poor gentleman of good descent, whom her mother, a New England girl, married after she, like Christie, had found the dull level of farmhouse life intolerable and gone out alone to seek for better things. We should be curious to know if the author designed this parentage to account for and fit the character she had previously conceived, or whether the character grew, as no doubt in the hands of a good artist it would, from the circumstances given. In any case the arrangement is a felicitous one; for while Christie inherits from her father a refinement of taste and perception which makes her at all times and in all situations a gentlewoman, from her mother she possesses an energy and promptitude which carry her through her own difficulties, and also those inborn instincts of sympathy with the masses which enable her to understand and alleviate the trials which attack the people of humbler descent than herself with whom she is thrown. This energy comes out strong on her entrance upon her adventurous career, when, after several vain efforts to obtain a situation as a governess, she resolves to "put her pride in her pocket and work her way up" by going out to service. This juncture reminds us of a novel of English life published a year or two ago by Mr. Aidé, *In that State of Life*, which had for its theme the unusual event of a girl born and bred in good society in this country going out as a sort of superior maid to an old lady. But with the mere coincidence of fact the likeness ceases; for in Mr. Aidé's book the whole interest is concentrated upon what in Miss Alcott's is merely an episode; and while the heroine of the former is very unlucky in the high-life-below-stairs which she has to encounter, while she finds an ardent admirer in the region of the drawing-room, Christie Devon discovers in Hepsy, the black cook and the sole companion of her labours, a woman with whose sorrows she can sympathize, and whose affection is a consolation and a relief from the pretentious vulgarity of Mrs. Stuart, the lady of the house. There is a good deal of quiet humour in the description of the amusement which Christie makes for herself in watching the peculiarities of her mistress and the visitors whom she attracts to her house, and one remark made by the author in her account of Christie's experience as a handmaiden specially deserves attention:—

If masters and mistresses knew how skilfully they are studied, criticized, and imitated by their servants, they would take more heed to their ways and set better examples perhaps. Mrs. Stuart never dreamed that her quiet, respectful Jane kept a sharp eye on all her movements, smiled covertly at her affectations, envied her accomplishments, and practised certain little elegancies that struck her fancy.

Christie's kindness to old Hepsy too, and the black woman's mingled gratitude and surprise at it, have something very touching in them.

This "experience" of Christie's is brought to an abrupt close by her setting the room on fire by reading in bed and forgetting to put out her candle—a catastrophe which leads to her dismissal, not so much on account of her offence as because her mistress, having given way to her feelings of rage and fright in the stress of the moment, feels that she has hopelessly compromised her dignity in the eyes of her servant. Thus this enterprising young woman is thrown once more upon her own resources, and by the friendly offices of another girl, with whom she had made friends at a boarding-house, lights upon the stage of a respectable theatre in the character of Queen of the Amazons in a grand spectacle. Her career on the stage is, if not brilliant, at least successful, and it affords occasion for the writer to show with how much freshness and force she can treat the well-worn subject of stage jealousy and intrigue, of which there is enough in this one portion of her heroine's life to form the nucleus of an ordinary three-volume novel. There is indeed a grand lavishness about the manner in which Miss Alcott uses her materials. Almost every period of Christie's various adventures contains a germ of plot which might easily be spread over the length of a whole book; yet there is no suggestion of piecing together in the result obtained, no such effect as that produced by individual pictures affixed without artistic instinct to a screen; the work is broad and harmonious. From the kitchen to the stage is perhaps a longer leap than from the stage to the bosom of an upper-class family in the capacity of governess, which is the next situation filled by the much-enduring Christie. Mrs. Saltonstall, her new employer, is a fashionable lady devoted to dress and to little else, who is of small importance in the book; but from Mr. Philip Fletcher, her brother, comes the first offer of marriage which Christie thinks it well to weigh in her mind, the first temptation to give up for the sake of rest, luxury, and the chance of employing the world's goods for the benefit of the world's inhabitants, the more exalted and apparently less practical idea of struggling through danger and defeat to earn for herself by her own exertions a place and an influence among her fellow-beings. This Philip Fletcher's character is drawn with considerable ability and truth; we see in him a man of good impulses suppressed rather than checked by the habits of bad health and an easy attainment of his wishes, who by long indulgence has learnt to make the killing of time his great object, but in whom there is still such a spark of a fine nature remaining as is finally fanned to a flame by the influence of the woman whom he looks upon, first as a new object in the landscape of his daily life, then as an interest, finally as a desirable wife. The growth of his feel-

* *Work: a Story of Experience.* By Louisa M. Alcott, Author of "Little Women," &c. London: Sampson Low & Co. 2 vols. 1873.

ing, and its reflex action upon its object, are depicted with a fine perception of character; witness this passage, which describes his state of mind shortly before he makes his offer :—

Something about this girl seemed to appeal to the old self, so long neglected that he thought it dead. He could not analyse the feeling, but was conscious of a desire to seem better than he was as he looked into those honest eyes; to talk well, that he might bring that frank smile to the lips that grew either sad or scornful when he tried worldly gossip or bitter satire; and to prove himself a man under all the elegance and polish of the gentleman.

He was discovering then, what Christie learned when her turn came, that fine natures seldom failed to draw out the finer traits of those who approach them, as the little witch-hazel wand, even in the hand of a child, detects and points to hidden springs in unsuspected spots. Women often possess this gift, and, when used worthily, find it as powerful as beauty; for, if less alluring, it is more lasting and more helpful, since it appeals, not to the senses, but to the souls of men.

But when it comes to the actual proposal Miss Alcott makes a great mistake. It is, we conceive, very hard for a woman to represent in writing a man who has been more or less spoiled all his life, and accustomed to succeed in making women like him, and yet to keep him a gentleman all the time; since even George Eliot has, to our thinking, failed in this way both with Stephen Guest in the *Mill on the Floss* and with Lydgate in her latest novel. But, however this may be, certain it is that Mr. Fletcher, in offering his hand to Christie Devon, shows himself such an arrogant and insufferable snob that he more than justifies the indignant scorn of the refusal for which she herself is almost as unprepared as he is. It takes all the novelist's skill to reinstate him in his position as a gentleman when he reappears long after this event, which naturally closes another chapter in Christie's life.

Her next venture launches her, as companion to an invalid girl, into the midst of a family named Carrol, over whom hangs a strange mystery, which in the end turns out to be hereditary insanity. And here we cannot but think that Miss Alcott has overtaken her powers. It can never be good art to deal in a novel, not otherwise than invigorating, and on the whole cheerful in tone, with so terrible a theme as this, any more than it would be to mix scraps from the gloomiest pages of Greek tragedy into a modern drama; the only thing that could excuse a writer for doing so would be the possession of some such wild and spasmodic genius as that of Edgar Poe, and it is assuredly not in his line that the author of the book now before us excels. Thus the only feelings excited in us by this part of the story are distaste and disappointment while we read, and relief when we have read. After the horrible climax which breaks up her relations with this family, Christie falls into illness and want, owing mainly to her refusal to cast off a woman with whom she has insisted on forming a friendship while they are fellow-workers at a large millinery establishment, upon the discovery that she has formerly been the reverse of respectable. This incident, and all its surroundings, are handled with a firmness and a sense of right which the author of *The New Magdalen* would have done well to study before he put his play on the boards. It is this girl who finally rescues Christie from suicide when she is utterly broken down by hard usage and destitution, and finds her a temporary refuge in the house of a laundress, by name Mrs. Wilkins, a character in whom, as elsewhere in the book, we recognize the influence of Dickens. Mrs. Wilkins is a woman who has been through many troubles, and from them acquired a large power of sympathy; she has thought for herself, and settled on a philosophy which we will let her explain in her own words, aptly illustrated from her profession :—

"'Pears to me," said Mrs. Wilkins, ironing rapidly as she spoke, "that folks is very like clothes, and a sight has to be done to keep 'em clean and whole. All on us has to lend a hand in this dreadful mixed-up wash, and each do our part, same as you and me is now. There's scrubbin' and bilin', wrauchin' and bluein', dryin' and foldin', ironin' and polishin', before any of us is fit for wear a Sunday mornin'."

From the care of this good Mrs. Wilkins, and chiefly by her means, Christie is transferred, as a sort of companion and house-keeper rolled into one, to the house of Mrs. Sterling, an old Quaker lady, which turns out to be her last haven of refuge. For here in the person of David, the only son of the kindly widow, she finds after many variations on the old chords of friendship, and doubt, and jealousy, the man who can hold her heart with his strong sweet nature. This is one of the best parts of the book; the character of David, who is so different from the melancholy romantic hero the girl has been prepared to see, is a fine conception, and is well sustained. Her woman's curiosity to know the hidden trouble of his life, and the dramatic scene in which she discovers what that trouble is, leading up to his declaration of love for her, are described well and with unflagging interest; indeed the dialogue between them when their engagement is arranged is as pretty and unwearisome a love scene as we have ever read in a novel. With this happy event we could for our own satisfaction wish the book to conclude; but, as its somewhat stern title might lead us to expect, there is no such peaceful bliss as we should in that case infer in store for these young people. The Civil War, which has done duty as the crisis of so many novels, appears here as a sort of *Demi ex machina*, and they go off, David as a soldier, his wife as a nurse, while Mrs. Wilkins at the same time, fired by patriotism, succeeds in getting her Lisha away to the war by the employment of a somewhat humorous device. When this has happened, who can be ignorant of what is coming? Of course the former dandy Fletcher turns up with only one arm left in the thick of the fighting, and finds his reward in the firm gentle nursing of Christie,

and, still more of course, David is struck down by a shot through the lungs, and Christie arrives just in time to see him well through his deathbed scene. We confess to feeling a little angry with Miss Alcott both for employing so well-worn an artifice to get rid of David, and for getting rid of him at all. For her treatment of this scene, however, she deserves all praise; not so much for what she has said as for what she has with a rare wisdom and good taste left unsaid.

After the time of mourning for her husband's death is over, Christie devotes herself to helping on the freed people—a good work in which she is assisted by a legacy of all his money from her old uncle, who, having retired ever since the first chapter, reappears just in time to do this and die, thus making the third death in the book. One of the last occasions on which we see the widowed Christie is at a meeting of working-women, the sketch of which is extremely well drawn. Many ladies, of course, are there, rich in theory, poor in practical method of relief; one talks over the heads of her audience, telling them of Hypatia and Aspasia, giving history to those who ask for bread; another cheerfully reads the statistics of suicide and starvation among shopwomen; presently rises Christie, and by the magnetism of her sympathy and her actual experience of what those whom she addresses suffer, her words go straight to their hearts, and they depart not unsatisfied. Shortly after this Bella Carrol turns up again, and comes to Christie for advice as to how she shall best employ her time and opportunities for the good of her sisters, and from what Christie says to her the reader will see something of the conclusion to which all her experience has brought her :—

I want you to make Harry's home as beautiful and attractive as you can; to keep all the elegance and refinement of former times, and to add to it a new charm by setting the fashion of common sense I'm "strong-minded," a radical and a reformer. I've done all sorts of dreadful things to get my living, and I have neither youth, beauty, talent, nor position to back me up; so I should only be politely ignored if I tried the experiment myself. I don't want you to break out and announce your purpose with a flourish, or try to reform society at large, but I do want you to devote yourself and your advantages to quietly insinuating a better state of things into one little circle. The very fact of your own want, your own weariness, proves how much such a reform is needed.

Let us to this excellent piece of advice subjoin the last paragraph of the book, and we will say good-by to Christie Devon and her experience. She is standing surrounded by her friends and her child, expressing her resolve to devote her whole life to the work she has taken up. She has stretched her hands out with an impulsive gesture, and they have been promptly seized by those standing round her :—

"Me too," cried little Ruth, and spread her chubby hand above the rest: a hopeful omen, seeming to promise that the coming generation of women will not only receive but deserve their liberty, by learning that the greatest of God's gifts to us is the privilege of sharing His great work.

Miss Alcott has faults in her writing; a tendency to ramble, a habit of imitating not only the spirit, but the mere verbal tricks of Dickens, whose works she has evidently studied; an occasional disregard of the arrangement of her words, and an inclination to run too much to climax. We hope to meet her again with these and other faults corrected, and with the same merit that we have found in *Work*. Meanwhile we recommend this as an excellent book to all young women who are discontented with their present lives, who feel that they have no sphere for the exercise of their virtues, who have vague longings for an ideal existence which they cannot formulate, and who may be in danger of quitting their inherited place in society to seek some new form of faith or some novel plan of life.

CHELSEA HOSPITAL.*

THE last home but one of many of the warriors who have illustrated the history of this country cannot fail to be an object of interest to thoughtful Englishmen. The very mention of a Chelsea Pensioner suggests memories of hard-fought struggles for British supremacy in India, Flanders, Egypt, and the Peninsula, not to speak of dying echoes of the achievements of Wolfe, Ligonier, and Marlborough. Every stone in the building is replete with glorious associations; every page of its records is an interesting addition to British military history. Major-General Hutt, the present secretary to the Commissioners, has therefore done well to publish *Papers illustrative of the Origin and Early History of the Royal Hospital at Chelsea*, and the Government has done no less well in sanctioning the publication of the book at the public expense. Before examining the result, we must mention that General Hutt has not aspired to write a complete history of the Hospital, but only to construct an authentic framework which may be useful to more ambitious writers, and to re-erect and authenticate certain landmarks which were in danger of disappearing from view. The work before us must, therefore, be considered as *mémoires pour servir*; but so judiciously have the materials been selected and arranged that the dryness which is a general characteristic of works of this sort is altogether absent.

Canon Kingsley has asserted that history is singularly devoid of truth. He might well have cited the prevalent ideas about Chelsea Hospital as establishing the correctness of his aphorism. It is a popular and fondly hugged tradition that our

* *Papers illustrative of the Origin and Early History of the Royal Hospital at Chelsea*. Compiled in the Secretary's office at that Institution. London: Printed by George E. Eyre & William Spottiswoode, Printers to the Queen, for Her Majesty's Stationary Office.

national refuge for worn-out soldiers owed its origin to the beneficent influence exercised over Charles II. by the charming, loose-livered, but kind-hearted Nell Gwynn, who of all Royal mistresses has ever been the favourite of the British nation. General Hutt, however, disposes summarily of the tradition in the following words:—"Though the story has been often repeated, the most careful research into the records of the period fails in any way to authenticate its truth." The real credit of having procured the foundation of Chelsea Hospital is due to Sir Stephen Fox, the first Paymaster-General of the Forces. Before his time the relief accorded to maimed and worn-out soldiers had been but poor and uncertain, though not for want of numerous statutes on the subject. In the Session of Parliament which began on the 19th of November, 1592, and ended on the 10th of April, 1593, the claims of sick, maimed, or worn-out soldiers to support at the expense of the State was first recognized, an Act being passed which cast on parishes and counties the task of providing for such. Considering the value of money in those days, the limits of the pensions to be paid cannot be deemed to have been too closely drawn. These limits were for a private soldier, 10*s*. for those of higher rank than a private, but inferior to lieutenants, 15*s*.; for lieutenants, 20*s*. per annum. Soldiers were on landing from abroad to be relieved by the counties through which they passed on their way to their place of settlement. The Act was, however, only to exist till the end of the next Session. As it was feared that some time would elapse before it could come into full operation, and the necessities of the soldiers daily arriving from France were urgent, the House of Lords adopted the remarkable course of raising sums from members of their own body, barons paying 20*s*., bishops 30*s*., and other peers 40*s*. It would appear that a similar subscription had been made by the Commons. The new Act failed to answer the expectations of its framers, each county or city endeavouring on various pretexts to pass on the men who claimed relief. Much distress and many complaints arising in consequence, the Council often took the initiative, and issued commendatory warrants on behalf of applicants. The disabled veterans were also provided for in other ways, some being admitted into the almshouses of cathedral cities, and others receiving assignments on the revenues of confiscated Church property. In the Parliamentary Session of 1597-8 three statutes were made concerning soldiers. One of these raised the minimum of the rates for their relief from 1*d*. to 2*d*. in the pound, and the maximum from 6*d*. to 8*d*. in the pound, increased four years later to 10*d*. The subject continued to attract attention; but little change was made in the system of providing for disabled soldiers until the Civil War, when "we find the first instance of pensions to soldiers defrayed from what may be termed national funds, instead of from the local taxation in counties." The source of this provision was the sequestration money, portions of which were repeatedly charged for "the relief of such maimed soldiers (scouts?), intelligences, and other emergencies." In 1651, for the first time, a national hospital for maimed and worn-out soldiers seems to have been thought of; for the House of Commons instructed the Council to "consider of a healthful place" for their residence; but no steps were taken in the matter. We find, however, that during the Civil Wars maimed and disabled soldiers were sent to the Savoy and Ely House, which had been converted into hospitals, and maintained in these buildings till disbandment, when they were sent to their respective parishes.

At the Restoration, a regular army, disguised under the title of "guards and garrisons," being kept up, and soldiers being for the first time permanently enlisted, it became absolutely necessary to provide for such as might become disabled or worn-out in the service. Not, however, till Charles II. had been twenty years on the throne could he spare time from his debaucheries to provide an asylum for the old age of those on whose loyalty the stability of his power so much depended. Sir Stephen Fox, as we have above mentioned, was the instigator of the good work, and on the 22nd of December, 1681, letters-patent under the Great Seal announced the King's intention "to erect an hospital for the relief of such land soldiers as were or might be sick or infirm in the service of the Crown, and endow it with a suitable revenue." The King gave 6,787*l*. 4*s*. 2*d*., an unapplied balance of Secret Service Money; Sir Stephen Fox and Tobias Rustat, an ex-page of the backstairs, contributed 1,300*l*. and 1,000*l*. respectively, and it was anticipated that the public would also subscribe liberally. But a poor response was made to the appeal, and, notwithstanding the lying statements about the liberality of the nation published in the *Gazette*, only 2,734*l*. was subscribed. In this strait an appeal was made to the clergy, the archbishops being desired to issue circulars to the bishops calling on them to try to induce such of their clergymen as might be well off to contribute liberally to so charitable a purpose. This device, however, signally failed; and money was raised from the troops themselves in the following manner. The army, in accordance with the vicious practice of those days, until Sir Stephen Fox became Paymaster-General in 1661, never received their pay till long after it became due. To remedy this hardship, Sir Stephen made a private arrangement by which he undertook to issue subsistence money weekly, the balance being paid after the next muster. To enable him to carry out this arrangement, he raised money on his own credit, and in return for this accommodation he received from the army a shilling in the pound. When, owing to the difficulties of the revenue, Sir Stephen, at the end

of eighteen years, put an end to the bargain, the King issued a Royal Warrant ordering that the troops should be paid regularly, and that, in return, the poundage or deduction of one shilling in the pound should be continued. In 1683 Charles directed that one-third, subsequently two-thirds, and finally the whole of the poundage should be applied to the erection of Chelsea Hospital. In 1684 it was ordered that, on the sale of commissions, both buyer and seller should pay a shilling in the pound to Chelsea Hospital. From the detailed statement of the amount thus obtained we gather that an ensign's commission was worth in those days from 200*l*. to 310*l*., a lieutenant's about 400*l*., and a captain's from 800*l*. to 3,000*l*. Only on one other occasion—namely, in 1713—was a similar percentage levied on the sale and purchase of commissions. A few months after the first-mentioned order it was directed that each officer and man should contribute one day's pay to Chelsea Hospital. In 1692 it was ordered that deductions to the amount of sixpence in the pound should be made from the salaries of half-pay officers, and in 1715 one shilling in the pound was withheld from the retired full pay of officers for the same purpose. This deduction ceased to be made after 1783. Another source of revenue was the value of 100 chaldrons of coal annually from the corporation of Newcastle-on-Tyne, as rent for the castle and castle fields leased by the Government. From time to time a few legacies were received by the Hospital. The out-pensioners were also, from 1754 till 1842, mulcted of certain sums under the head of poundage, and a large amount of unclaimed prize-money has from time to time been transferred to the credit of the Commissioners.

The total sum paid by the army itself amounted to about eight millions and three-quarters, and at first sight it would seem as if the country had generously made up the balance; but on closer examination we find that the cost of the Hospital itself has been, in round numbers, only 4,700,000*l*. It will be seen, therefore, that the army paid nearly twice as much as was required for the maintenance of an institution the benefits of which it is fondly believed to owe to the generosity of the country. In the Estimates for the coming military year a sum of 29,731*l*. is set down as the amount which Parliament is asked to vote for the maintenance of Chelsea Hospital; but, in giving this sum, the country will only be repaying what in former years was scandalously diverted from its proper destination. For instance, no less than 51,254*l*. had been paid to out-pensioners up to 1846-47. Now the out-pensioners may be considered as part of the remuneration in consideration of which a soldier engaged to serve the Crown. There are other items which are equally inadmissible; such as the total of 2,132,466*l*. 12*s*. 3*d*., entered under the head of Pay Office, War Office, Exchequer fees, and other army purposes, poundage transferred to Irish Treasury, as well as that returned to the troops in lieu of increase of pay and transfers to Exchequer. With regard to the first, the chief item is for the expenses of the Pay Office, which up to 1784 were regularly defrayed out of the funds of Chelsea Hospital. The War Office was also maintained from the same source from 1715 up to 1783. It is worthy of note that the cost of the War Office was in 1717, and every succeeding year up to 1783, only 2,455*l*. In the Estimates for 1873-74 it is set down as 148,672*l*. Among other sums irregularly applied we may include 556*l*. 1*s*. 8*d*. for New Year's gifts at the Treasury and Exchequer. But besides what may be termed authorised embezzlements, there were also unauthorised irregularities. It appears from a Report drawn up in 1713 by the then Paymaster-General, that the butcher to the Hospital had been "obliged to deliver to the Governor and Lieutenant-Governor great quantity of provisions, for w^{ch} he was not to be otherwise paid." In the same Report another abuse is disclosed—namely, in "the management of the cooks who dress and supply meat to many of y^e inhabitants in the neighbourhood of y^e college from the kitchen of y^e hospital as out of a public tavern, which is certainly a scandalous practice, and must be in a great measure, if not totally at y^e publick expense, w^{ch} may very well justify my proposal to your Lord^{sh} for retrenching one of the Ma^{rs} Cooks." The management of the affairs of the Hospital appears indeed to have been at that time as loose as possible, frauds on the Commissioners being systematically practised on a very large scale in the matter of out-pensioners. A Report of a Committee of the Privy Council, submitted in 1714, contains the following remarkable passage on this head:—

There are recruiting officers that bear up for and levy invalids to claim the pension; there are officers that prepare the certificates of the men's qualifications. Furlows signed by the Governor are always ready for them, immediately upon their admission, and there are persons ready to take upon them the trouble of receiving their pension by letter of attorney, and to advance to them as the stock rises or falls in or about Chelsea. And another advantage these persons seem to have, a man is no sooner admitted an invalid but he becomes immortal, there not having one man died out of 9,109 from the time of their first admission.

But if the Government had reason to complain of the pensioners, the pensioners had till 1754 no less reason to complain of the Government. In 1703 the Commissioners state that the out-pensioners "have not been cleared since the 1st of July, 1696, only have had some small sums paid in to their quarters and other creditors upon account, and there was due to them over and above those payments to the 24th December last year near five thousand pounds or thereabouts—most of which, if not all, is owing to the inhabitants of Westminster and Chelsea, who have supported them ever since the year 1696, in expectation of the said pensions, and are great sufferers, and some of them entirely impoverished

thereby." There was probably greater regularity afterwards; still we find that till the year 1754 the out-pensioners suffered much hardship from their pensions being constantly in arrear, so that they were, to use the language of an Act passed for their relief, "necessitated to take up money for present subsistence on credit of persons called money-lenders, on terms many times oppressive and usurious."

Having now reviewed the chief money transactions in connexion with Chelsea Hospital, we may say a few words about the building itself. All the lands about Chelsea and Battersea were originally Church lands, belonging to the Abbot of Westminster, and were sequestered at the Reformation. When James I. ascended the throne all these lands had, with the exception of some twenty-eight acres at Chelsea and a part called Blacklands, passed into the hands of private owners. On the twenty-eight acres above mentioned James determined to build a college for the study of divinity, and in 1610 he issued letters of incorporation. The idea of the King seems to have been very imperfectly carried out, and in 1647 the College, which had fallen into decay, reverted to the Crown. Soon afterwards it was converted into a prison for officers and men captured in war, and in 1664 we find Dutch prisoners, and in 1669 French prisoners, confined there. The College was then handed over to the Royal Society; but the latter found their property of little value, and on January 11, 1682, sold it to the Crown for 1,300*l.*, and thought that they had made an excellent bargain. On the 17th of February Charles II. laid the first stone of the new edifice, and ten years later the building, though unfinished, was sufficiently advanced to admit of occupation. The main building was finally completed in 1694, but considerable additions in the shape of detached houses have from time to time been made. As a curious instance of how names stick to places long after they have ceased to be appropriate, we may mention that to this day Chelsea Hospital is spoken of by the neighbours almost invariably as "the College."

In conclusion, we may state that in 1872 the number of out-pensioners was 66,281, and of in-pensioners 540. The former will gradually be greatly reduced; but as to the latter, they have as yet escaped the destroying touch of army reorganization, and we sincerely trust that Chelsea Hospital, meeting with better fortune than the sister establishment at Greenwich, may long continue to afford that comfortable and honourable asylum to old soldiers which the army has itself paid for, and which could not be devoted to other purposes without a palpable breach of faith. However, who can tell?—rien n'est sacré pour un saxon; and reforming Ministers of War are not much overburdened with reverence.

MINOR POETS.*

A FEW of the Sonnets, Lyrics, and Translations by the Rev. Charles Turner, as we are told in a note, "appeared lately in magazines. Some of the latter are republications, with more or less alteration, from a volume printed in 1830. The remainder are quite new." The volume referred to was, we believe, the joint production of Mr. Turner and of his brother, the present Poet-Laureate. While the one brother since that time has poured forth poem after poem, and book after book, the other has to show, it would seem, for all this length of years but this one slight volume of just a hundred pages. It may be thought perhaps by some that the one would have consulted his reputation better by publishing less and the other by publishing more. Mr. Turner succeeds much better with the Sonnet, difficult measure though it is, than with either his Lyrics or his Translations. It may be, however, that he has been more fortunate in the subjects he has chosen for his Sonnets than in those he chose for his Lyrics. It is not surprising that a man should fail in putting forth his poetry, however much he may have succeeded in putting forth his loyalty, who writes a lyric "For the Maddingly School, on the arrival of the Prince of Wales at the Manor House, in 1861." No doubt the following verse, when sung by a host of school children in their Sunday clothes, and bright with their freshly washed faces and the prospects of unlimited plum-cake, may have sounded well enough. It was, however, scarcely worth printing, unless perchance in the Poet's Corner of some county newspaper:—

Heaven, through all jeopardy,
Over the misty sea,
Watch'd thy return!
Welcome home, welcome here!
Now more than ever dear,
Britain's true Prince and heir,
Come to sojourn.

Very different from such poetry as this, loyal though it is, are some of Mr. Turner's Sonnets. We find it somewhat difficult to select one for quotation where there are so many that please us. Perhaps the following, entitled "On finding a small fly crushed

in a book," may be taken as a fair sample of the poet's style and power:—

Some hand, that never meant to do thee hurt,
Has crush'd thee here between these pages' part;
But thou hast left thine own fair monument,
Thy wings gleam out and tell me what thou wert.
Oh! that the memories, which survive us here,
Were half as lovely as these wings of thine!
Pure relics of a blameless life, that shine
Now thou art gone! Our doom is ever near:
The peril is beside us day by day;
The book will close upon us, it may be,
Just as we lift ourselves to soar away
Upon the summer-air. But, unlike thee,
The closing book may stop our vital breath,
Yet leave no lustre on our page of death.

It is strange, by the way, that a Lincolnshire man—one who had been brought up where *Northern Farmers* abound—should so much as dream of making *warm* rhyme with *calm*. In the same poem in which Mr. Turner perpetrates this horror he makes *Abergele* rhyme with *feel*; but in this case he guards himself by adding in a note "English pronunciation." Would it not have been just as well if he had added in another note to his rhyme of *warm* and *calm* "cockney pronunciation"?

Since the days of "the most lamentable comedy and most cruel death of Pyramus and Thisby," we doubt if a tragedy has been produced which in point of humour can compare with the *King's Stratagem*. It is not often that out of our minor poets we get much amusement, but we can assure our anonymous dramatist that rarely even in the most tearful moments of our modern sentimental tragedians have we seen anything so exquisitely ludicrous as his five-act tragedy. Mr. Willis's character of Oliver Cromwell had its humour, especially when personified by the actor who is so great in Sam Weller, but even it falls far short of what we have here. How admirable is the concluding line of the list of the *Dramatis Personæ*—Noblemen—Bishops—People—Guards—Servants—Vassals, and Ghosts! We have for some years, on the stages of our largest theatres, had two clowns in the pantomime. Till the *King's Stratagem* was written no one, we believe, had shown an equal liberality in ghosts. The scene opens on the bank of the Vistula. Christine, the heroine, enters followed by Alisa her nurse "in the attire of a cavalier." Christine informs her nurse,

I think thee horrible in pantaloons,
And would prefer a natural gentleman.

Alisa replies:—

Girls in their teens think not of gentlemen;
(Aside.) Oh! this is frightful!

To divert her thoughts she requests Christine to repeat her translation of the Battle of the Gods from Homer. Unhappily there was a young Lord Milo who was too much for Homer. Alisa in alarm informs Christine's guardian, Bishop Stanislas. Scene iii. opens in "an Oak-Parlour, Stanislas walks to and fro. He stops and clasps his brow with his right hand as if to fix his thoughts." After a long speech

[He dashes a tear from his cheek, and strides forward into the arms of MILO as he enters from an avenue, followed closely by SOBOUSKI, the King's dog, muffled in a dark mantle. He passes behind a tree. The two noblemen seat themselves on a garden bench beneath the same. ALISA appears at one angle of the lower, cove-dropping, and WALDIMER at another, each ignorant of the other's presence or of the presence of SOBOUSKI.]

Sobouski overhears the Bishop's proposal to Milo for his instant marriage with Christine. He informs King Boleslas of it, who determines to murder Milo and to carry off the bride. On the evening of the marriage-day, at a grand dance that is given, the King suddenly appears. "The music stops, the dancers pause with signs of discontent. Alisa exclaims from behind her mask, 'Upon some evil is he bound. I will keep nigh with dagger ready.'" The King dances with Christine, who soon runs from him and "falls swooning into Milo's arms. Alisa rushes at the King with a drawn dagger. The guards seize her. Tableau." In Scene v. voices are heard within crying, "Murder! oh, murder! murder! murder! thief!" and "three royal favourites masked," who have entered "right of centre" and murdered Milo, rush out bearing Christine, a second time swooning. Act ii. opens in the King's palace, where in a dimly-lighted room Christine is discovered. Boleslas enters by a secret door and attempts to embrace her. But happily "Milo's ghost glides between them and backs Boleslas out." The ghost then, "returning to the sofa," tells Christine to write to Count Waldimir for help. Waldimir having received her letter hurries off to Stanislas, who receives the narrative in a way to make even Mr. Irving jealous:—

[During this narration STANISLAS holds WALDIMER'S arm with a death-clasp, draws himself up halfway between a horizontal and a perpendicular, and gazes into the speaker's face with the stare of a maniac.]

No wonder that Waldimir, rubbing his arm, exclaims:—

Thy clasp, my lord, is too emphatical—
Resume thy pillow—Jean, sit down behind him.

The Count and the Bishop determine to appeal to the Primate of Poland, who, beyond saying "Ah! ah! 'tis very sad! 'tis very sad!" and "wiping a timid tear," shows himself little moved. Waldimir then rises to yet higher eloquence:—

[During this appeal, STANISLAS slides from his seat and croups on his knees towards the speaker, who is on his knees before the Primate: at the end, weeping, they rush into each other's arms, and remain thus during the Primate's speech.]

In the next scene the King relieves himself by a game at chess, but "the Ghost stands behind the King, misplacing the pieces."

* *Sonnets, Lyrics, and Translations.* By the Rev. Charles Turner, Vicar of Grashy, Lincolnshire. London: Henry S. King & Co. 1873.

The King's Stratagem; or, the Pearl of Poland. A Tragedy in Five Acts. By the Author of "Records of the Heart," "Child of the Sea," "Myths of the Minstrels," &c. London: Trübner & Co. 1873.

Searching the Net. A Book of Verses. By John Leicester Warren, Author of "Philoctetes." London: Strahan & Co. 1873.

The Tournament, and other Poems. By "Chrl." London: Dickinson & Higham. 1873.

Nothing much comes of this, except that the King is checkmated, till at length Stanislas comes in. The King, "concealing his head in his mantle," cries

Guards, seize the Pontiff! Seize the Ghost! Away
With them—away!

The Ghost wisely vanishes, while "the guards drag Stanislas out, crying 'Woe to Rokolias!'" Presently "re-enters the Ghost by a secret door, followed by Christine, who is crazy." Christine stabs the spy Sobouski. The King orders her to be arrested, but he "espies the Ghost, which hovers near her, and staggers backward aghast. The curtain falls on tableau, to low solemn music."

In Act iii. "the King rises and looks round on the vast assembly with a pleasing smile," and then accuses the Bishop of Milo's murder; but "blood spots appear on the hands of two of the murderers as they lift them to hide their faces." The curtain falls on tableau to slow music. In the next scene Waldimir rescues Christine from the King's palace "while shrieking women in dishabille rush out by the different portals." A second vast assembly is held, and the Ghost comes and swears on the Bible. "The King partially swoons." Waldimir enters bearing Christine in his arms, and places her hand in the Ghost's, though he has to uphold her. Before long the King recovers enough to stab Stanislas to the heart, "who falls into the arms of Waldimir, who has confided the swooning girl to his valet." Thereupon Alisa, "dashing through the terrified crowd, pale and dishevelled, seizes the King's arms," and cries out,

Fiend! Triple murderer! Infanticide!

"He starts from his stupor and stabs her." She dies exclaiming,

'Tis done at last! My blood is on thy soul!
Thou'st killed the long-lost Princess Guika—Oh!

The Ghost "points its pale fingers at the King as it vanishes amid a halo of mist." The King (running to and fro) exclaims:—

'Tis so! A torch is burning in my brain!
Devils pursuing me with clanking chains—
Oh! keep them off! Oh! keep them off! Save me, friends!

[His favourites succeed in restraining him. The curtain falls on tableau, to low solemn music.]

In Act v. Christine is discovered "reclining on a couch. Nurse seated near the foot of couch, snoring." Christine slips off, and throws herself into the Vistula. Waldimir, "Doctor, and vassals run in *en dishabille*." The shrieking women of Act iv., by the way, were in "dishabille." Waldimir exclaims:—

Fly! search the manor-seat, the park, the Vistula!

The family woodcutter saves Christine, but only for a time, for she makes her way to the cemetery,

Singing "I'm going home" in such a voice,
It made me cry just like a boy that's whipped.

Then he sees the ghosts of the King's three victims bearing her up to Heaven. Waldimir will not believe she is dead, but, addressing the Doctor, says:—

O man of art! remove these springs of life!
Motion this beautiful machinery!

The wicked King meanwhile has rushed in, "believing his body to be entwined by a serpent, whose coil he is trying to break." He thus laments:—

Aback! ye howling demons! Basilisk, off!
Unclasp your fiery folds! Unclasp my heart!
Or I will break thy damnd coil. Oh! oh!
There, now! I've got my heel upon thy head!
Die! die! ha! ha! I've vanquished thee! ha! ha!

"The curtain falls on tableau to solemn music."

We have more than once already had the pleasure of bringing before our readers' notice the poems of Mr. J. Leicester Warren. Unlike so many of our modern poets, he has evidently made a study of poetry before he set up for poet, and he has made his study among those ancient models which, by their severity, tend to restrain the young writer from falling into the extravagances that are now so fashionable. If at times some of his poems—the "Cardinal's Lament," for instance—seem to bear an echo of Mr. Browning, at all events the echo is of Mr. Browning where he is even and strong, not where he is extravagant and weak. The following lines from the poem entitled the "Defeat of Glory" will show Mr. Warren's power in passages where he may fairly claim to be no man's follower. He is describing the death-bed of a great king:—

Thine ears retain no murmur from the street;
To thee dim rain is one with earnest noon;
Thy dull brain cannot catch the perfume sweet,
When the field deepens into perfect June.

The record of thy days becomes a blot;
The yearling infant calls its sister's name.
O princely phantom, with thy fame forgot,
Move, if thou canst, thy lips and do the same.

Thy white hands only tremble on the sheet,
Tho' thy Prætorian legions watch around,
And under echoing archways in the heat
The feet of many sentinels resound.

All night the melancholy bugle calls,
All hours goes on the guardian soldier's pace.
Arms clash at dawn within the warrior halls,
And drums in thunder wake the market-place.

Mr. Warren, by the way, is guilty of the same kind of rhyme as Mr. Turner, for he makes rhyme *arm* with *calm*. It is idle, we

fear, to lift up our voice against such utterance as this. Fashionable society and the Minor Poets together are too powerful for us. All the stronger sounds are one by one dropping out of our English tongue, and we shall soon talk a language as soft and as weak as is our modern sentimentality. The next thing will be for the learned Society that is so strong in phonetics to correct the spelling, and so to write *arm* and *warm* that, not only to the ear, but also to the eye, they shall rhyme with *calm*. Mr. Turner and Mr. Warren are not, we dare say, as yet prepared to go quite the lengths of Mr. Digby, another of our Minor Poets, the author of *Last Year's Leaves*. He makes *trust* rhyme with *first*, as indeed it commonly does within the sound of Bow Bells. But they should know that they are separated from Mr. Digby and from Mrs. Camp only by degree, and, knowing this, they should pause in their downward course.

The object of the authoress of the *Tournament and other Poems* is most laudable and altogether worthy of the Sydenham Young Men's Christian Association, to which, "with very kind Christian regards and earnest desire for prosperity," she dedicates her "little volume." She would, she tells us,

So renovate man's mind that ne'er withstood
Should be the grand sublime, the gloriously good.

The Crystal Palace that now stands at Sydenham was to have done all this in 1851, but where Cole C.B. has come short, she and the Sydenham Young Men's Christian Association will step in and fill up what is wanting. There would seem to be something either in the air of Sydenham, or in the contents of its Palace, that is conducive to what our poetess calls "the gush, and rush, or gentler flow of song." It is not long ago that we had the pleasure of noticing the work of a writer whose boast it was that he was not only a poet, but also one of the firework makers for the Crystal Palace. Our present poetess describes herself as

This lady, loving, pitying all mankind,
Admiring virtues—to defects not blind.

There would seem to be one defect—that, namely, of all rhyme and reason—in her own writings, to which most unfortunately she is blind. Such a rhyme as *Pro Forma* and *warmer* would doubtless pass muster in any Sydenham Association, whether young or old, Christian or heathen. But we cannot believe that the youngest and the most Christian of associations would be so blinded by their piety as to consider this "little volume" of more than two hundred full pages as anything but nonsense. The best use the Sydenham Young Men's Christian Association could make of the volume would be to use it as a kind of penance. Any erring brother who might have been tempted so far from virtue's path as to go to a dance, or who at some Foresters' festival had played at *Aïss in the Ring*, might be made to learn as many lines by heart as the dances or kisses he had committed. And yet the sternest moralist would feel some degree of pity as he heard the penitent youth couining such lines as the following:—

Such beautiful summer e'en, that sprays instir
Seemed soft harmonious sostenuto whir
Of angels' wings,—air odorons fanned above,—
Their breathings to inspire with holiness and love.

The authoress does not always keep at such heights as this, but frequently comes down more nearly to the level of the young Christian of Sydenham. The following verse, if perplexing in its construction and apparently innocent of grammar, clearly contains some simple morality:—

Forget not what boys sow they reap.
Sow not, ill weeds abounding
Oft sluggard's garden smothered keep,
Malaria its surrounding.

FRENCH LITERATURE.

M. GUSTAVE DESNOIRESTERRES * is approaching to the end of his amusing gossiping work on Voltaire; it was in 1755 that the arch-philosopher took up his residence at Les Délices, in the canton of Geneva, and the present volume leads us from that date to the year 1760, when the comedy entitled *L'Ecosserie* created such scandal by its vehement and unjustifiable attacks on the poor journalist Fréron. This part of the work contains some piquant details on the discussions which Voltaire carried on with the *magnifique conseil* of the Genevese Republic, and on the heinous offence which he gave by persisting in profaning the head-quarters of Calvinist Protestantism with dramatic performances. It is true that free-thinking notions had already made sad havoc even at Geneva, but the old Puritanical traditions were still dear to the majority, and the *magnifique conseil* fulminated edicts against playwrights and playgoers with the same spirit which during the previous century inspired in England the author of the *Histromastix*. Lefranc de Pompignan, Trublet, and Palissot occupy an important place in this volume, and M. Desnoiresterres himself is obliged to acknowledge that Voltaire had a singular idea of the duties and rights of a critic. If he thought himself offended, he never scrupled to denounce his adversaries as gallows-birds, and to endeavour to show that virtue was grievously insulted in his person. The author of *Didon* was no doubt extremely conceited, but his estimate of the Ferney patriarch is perfectly true, and in the case of the editor of *L'Année littéraire* we cannot think it a very dignified act on the part of Voltaire to drag him before the public under the transparent pseudonym of *Fréron*.

* Voltaire aux Délices. Par Gustave Desnoiresterres. Paris: D'Ala.

What is the task which a writer undertakes who aims at giving a complete and accurate view of Pythagoras and his philosophy? M. Nourissou has defined it so well that we cannot do better than quote him. There is, in the first place, a legend two thousand years old containing a small modicum of historic truth; that element of truth must be sifted and presented to the reader free from all alloy. We have besides a few, a very few texts, scattered here and there, mutilated, interpolated, and often contested by the best critics; and it is on this narrow and insecure basis that the writer has to build. Such difficulties are enough to discourage the most plodding and enthusiastic *savant*; and therefore we cannot feel surprised that when the Académie des Sciences morales et politiques proposed the subject in question to the candidates for one of its prizes, only one person responded to the appeal and took up the challenge. M. Chaignet's work*, however, is so complete and able that it fully deserves the reward it obtained. He has divided his essay into four parts. Discussing first the indirect sources from which the elements of the life of Pythagoras can be gathered, he narrates that life, and describes the history of the Italic school, as it is sometimes called. The second part is occupied by an examination of the direct sources which may enable us to form some acquaintance with the Pythagorean doctrines. It was hardly sufficient to determine from a general point of view the authenticity of the fragments consulted. M. Chaignet justly thought that a minute investigation was necessary; and therefore he translated into French the entire fragments of Philolaus and Archytas, accompanying his version by a brief commentary. An interesting and detailed account of the system of Pythagoras forms the third part—the longest and most important—of the work; and, finally, comes a statement of the influence which that system has had over subsequent schools of thought, concluding with a critical estimate of its merits. We observe with satisfaction that M. Chaignet has been very liberal in giving quotations from the sources to which he refers. The reader is thus enabled to weigh the value of his statements, and to judge for himself.

Works on German literature are plentiful just now, and two among them especially deserve to be noticed here. M. Alfred Mézières† publishes the second and concluding volume of his lectures on Goethe, taking up the poet's life at the time when he became acquainted with Schiller. It may be asserted, as a general principle, that the study of a great author's writings is the best comment on his biography, and such is particularly the case with Goethe. *Hermann und Dorothea*, *Faust*, *Torquato Tasso*—to name only these three compositions—are pages from his life, and we all know that Fräulein von Klettenberg stood as the type of Gretchen at a time when, like the hero of his great poem, he dabbled in alchemy. M. Mézières brings this point prominently forward, and dilates upon it most successfully; he has also given an interesting sketch of Madame de Staël's visit to Weimar, and has devoted an entire chapter to the relations which took place between Goethe and Napoleon.

M. Bossert's volume‡ covers nearly the same ground as the one we have just noticed, with the exception that Schiller occupies in it an equal space with the author of *Werther*, and that the whole literary society of Weimar passes before our eyes in a brilliant and well-drawn panorama. M. Bossert lectures on German literature at the Sorbonne, and the present octavo is the third of a series the first two instalments of which we noticed some time ago; it is introduced by an inaugural address on the union of the literary and the theological element in German thought. M. Bossert remarks that during the seventeenth century, whilst England was throwing its political constitution into shape, whilst France was cultivating the amenities of social life, and moulding itself according to the most brilliant Court in Europe, Germany, absorbed by theological questions, seemed to think that there was nothing else worth studying. The result, he adds, has proved that this bent of the national mind was far from unfavourable to subsequent literary progress, and we see likewise the reason why the seventeenth century was a blank in German literature. Theology came first; Bodmer, Breitinger, and the leaders of the Zurich school took as their starting-point the study of the Bible; Klopstock looked upon himself as a religious reformer, and it was with Goethe that the new literary movement began.

The reputation of Gavarni§ will not gain much by the biography which MM. de Goncourt have written of him. He was a man of considerable talent, but unfortunately his pencil was always employed upon scenes which represented the worst side of French society. He has sometimes been compared to Hogarth; but the *Mariage à la Mode* and the *Rake's Progress* convey a moral with them; whereas Gavarni's lithographs, unmistakably clever though they are, tell nothing but tales of vice and folly. The artist's life, from MM. de Goncourt's own showing, was an exact counterpart of his talent, and the narrative of it is extremely painful, because it introduces us to a "Bohemian" who remained hopelessly such to the very end.

In our last monthly summary we said a few words of M. Viollet-Leduc's excellent work on architecture. The second volume, which

we have now to notice*, begins with the thirteenth *embellissement*, and takes us away from the historical to the practical part of the subject. The author discusses successively the method which architects ought to follow, the means at their disposal, the application of statuary to the embellishment of modern constructions, the teaching of architecture, and the present state of that branch of the Fine Arts in Europe. He ends by giving students a number of judicious hints on the financial difficulties connected with their profession, their relations with builders, and the competitions which they must undergo if they wish to obtain any notice from Government; and he is thus led to remark on the pretensions of the State to interfere with questions of which it is absolutely ignorant. This petty meddling, M. Viollet-Leduc says, has had the natural result of encouraging mediocrity, and of bringing about the decay of architecture.

M. Jules Claretie's little volume on Molière† is a panegyric written in a tone of exaggeration which is sometimes ridiculous, and it contains nothing new either in the way of biographical detail or of critical appreciation. According to M. Claretie, who quotes Camille Desmoulins, the author of *Le misanthrope* was a *républicain de la ville*, and it is owing to Molière, Rabelais, Montaigne, Voltaire, and La Fontaine that France may be regarded as "the soldier of the human race." We need not add that, in speaking of *Tartuffe*, our panegyrist does not lose the opportunity of declaiming against Jesuitism, casuistry, and hypocrisy. The only part of his book which deserves to be read is the appendix, in which are various interesting historical documents, and amongst others some short biographical notices of the actors and actresses belonging to Molière's troupe.

The arrest and murder of the Duke d'Enghien‡ have suggested to M. Gourdon de Genouillac an interesting volume, though it is written too much in the style of a novel. It was surely unnecessary to throw into a sensational form a narrative which was already sufficiently dramatic. The tragedy performed at Vincennes by the direction of the First Consul was only the last scene of the famous conspiracy which George Cadoudal and his accomplices had imprudently organized against a ruler whose police, always on the alert, would have set at defiance even more cautious adversaries. M. de Genouillac relates all the circumstances of the plot, gives numerous despatches sent by the principal agents of Bonaparte's Government, describes the questioning and cross-questioning which the unfortunate victim had to undergo, and shows what the attitude was both of Napoleon himself and of foreign Courts when the deed had been perpetrated.

M. Jay's book§ is not a narrative of skirmishes and battles like those which have already appeared so abundantly in connexion with the war of 1870-71; it is the simple and unpretending statement of the efforts made by a few men, under the direction of Count de Kératry, to organize and arm the mobilized troops of the five departments of ancient Brittany. The author speaks of what he has seen with the earnestness of an impartial, though not a disinterested, witness. The book consists of nine chapters, with an appendix of documents most interesting in their variety. It is really curious to see with what rapidity the Bretons were transformed into soldiers, and how readily men snatched from the plough or the counting-house adapted themselves to all the hardships of military life. If we may believe M. Jay, this transformation was incomplete, and he gives us the reason why. The persons at the head of the Republican Government did all they could, almost from the very beginning, to place obstacles in the way of Count Kératry—red-tapeism and political prejudices having taken possession of M. Gambetta's mind; instead of encouraging and helping the organization of the mobilized Breton troops, he did, we are told, his very best to hinder it.

The subject of M. de Laveleye's new book|| is one which deserves more judicious and dispassionate treatment than it usually receives at the hands of the advocates of what are called "peace principles." The author is not one of those who imagine that the age of warfare has passed, and that the days have come when the famous prophecy of Isaiah is about to be realized. The events of the last three years are enough to rebuke the delusions of Utopians, and it does not require much sagacity to see that Europe at the present time is threatened by wars of a more terrible nature than any which it has hitherto witnessed. "Let us not," says M. de Laveleye, "allow ourselves to be lulled to sleep by the few intervals of repose we are now enjoying. Everything leads us to believe that towards the end of this century Europe will be transformed into a kind of hell. The settlement of social questions arrays class against class, whilst the question of nationalities pits race against race." M. de Laveleye discusses these topics in the first two divisions of his volume, reserving the third and concluding part for an exposition of the principle of arbitration which he wishes to see introduced. He believes that the causes of war can be even now considerably diminished; and he has persuaded himself that, if private feuds are impossible because there are laws which determine individual rights, in like manner there ought to be, and will be at some future period, an international court created for the pur-

pose of settling the differences arising between political communities. The three preliminary points to be determined are, he considers, the following:—1. To appoint a conference of delegates named by the various countries (lawyers and diplomatists) in order to lay down the principles of international law at present contested. 2. To decide that, in case of a disagreement about the application of these principles, the contending parties will bind themselves to accept the verdict of a supreme court consisting of jurists representing the contracting nations. 3. To renew the twenty-third protocol of the Treaty of Paris by stipulating that, in case of disagreement, before making a final appeal to arms, the disputants shall submit their respective cases to the decision of the contracting States; and in all future treaties a clause to that effect shall be inserted. We have great respect for M. de Laveleye, and the intention of his book is excellent; but we do not see any sign that he so much as understands where the real difficulties of his subject lie. We certainly cannot congratulate him on having solved them.

Baron de Wogan* is an indefatigable traveller and an agreeable writer, as a previous volume of his had already shown. The present book, containing the sequel of his journey, covers a tolerably large tract of country, for it takes us from California to Mexico. The first chapter is one of the most interesting in the volume, describing as it does the settlement of Captain Sutter in the gold regions, and the commencement of the diggings. After having served in the Swiss Guards of Charles X., Sutter left France at the Revolution of 1830, and, gathering around him a handful of adventurers prepared for every emergency, he established a colony on the left bank of the Sacramento, and by dint of pluck and cleverness managed to secure the respect and friendship of the neighbouring Indian tribes. Popularity, however, is sometimes dangerous, and Sutter had already excited the jealousy of the Mexican Government when the accidental discovery of gold which he made on his territory completely ruined him. An invasion took place, and the unfortunate Swiss captain was compelled to give way before the ever-increasing tide of immigrants whom the *aurea sacra fames* attracted from all quarters of the globe. Baron de Wogan's description of American civilization is very entertaining. His narrative terminates with a chapter from the history of his early life, in the course of which we learn that he is a lineal descendant of the Captain Wogan immortalized in *Waverley*.

The contrast between the Sahara and Lapland† is striking enough, so far as landscape and climate are concerned, but both regions are occupied by nomadic tribes whose habits are pretty much the same. Count Goblet d'Alviella explored the Sahara in company with the French troops employed to crush the last Algerian insurrection; he had therefore good opportunities for observing both the country and the natives, and he has jotted down a few noteworthy remarks both on the ethnography of Africa and on the probable destinies of the French settlement in the north of that continent. His journey to Lapland was performed in 1868; he started from Stockholm, reached the Frozen Ocean, and came back along the shores of Norway. The obstacles of every kind which he met with did not prevent him from doing full justice to the stern beauty of the country through which he wandered, and he was fortunate enough to meet with a companion, Baron de Borchman, whose sketches illustrate very faithfully some curious details of scenery and costume. The drawings which render the same service to the African part of the volume are by a French artist, Captain Lièvre.

The excellent volume composed by M. and Madame Delon under the title *Exercices et traductions pour les enfants*‡ is an application of the methods of Pestalozzi and Froebel, and is intended to teach by a series of progressive lessons all the elementary facts connected with form and colouring. The authors' preface, extending over forty pages, is a programme of primary education founded on the important axiom that, as all reforms should begin at the beginning, so, where education is concerned, improvements ought to be started almost in the nursery. The work is copiously illustrated with diagrams.

M. Hippéau continues his researches on the state of education in the principal nations of the civilized world, and he now discusses upon Germany.§ The preface contains a striking parallel between the United States and Germany from the educational point of view, and its object is to prove that, however admirable may be the provisions made by the latter country for public instruction, yet the results obtained in America are greater still. M. Hippéau dwells at some length upon the struggle which he conceives to be now going on in Germany between the general civilization sprung from Greek and Roman antiquity and that special form of intellectual culture which corresponds to the national instincts of the Teutonic race.

We have another contribution to the history of the Reign of Terror. The Abbé Dumesnil|| was one of the very few non-jurists who dared to remain at their post during the worst period of the revolutionary struggle. In the year 1801 he wrote a short account of the scenes he had witnessed and the persecutions which

he had encountered, and it is the second edition of these *Souvenirs* which Barthelemy Ernest now publishes, accompanying them with historical and biographical notes.

The thesis which M. Jean Chassériau undertakes to establish* is the favourite one of MM. Vuit, De Pressensac, Scherer, and others—namely, the separation of Church and State. He begins with remarking that France offers a phenomenon which has never been matched in the history of mankind—that of a nation in all the fulness of its intellectual and political life suddenly upsetting the basis upon which it had stood for centuries, and endeavouring to organize itself anew under totally different conditions. It is not to be wondered at that a community thus torn asunder should have lost even the idea of moral unity, and that its history ever since should be nothing but a narrative of endless and unprofitable revolutions. In order to direct his country into a better course, M. Chassériau reads to it a lesson from the annals of the past, and gives a brief sketch of the struggle carried on between the principle of authority which subordinates everything to religion and the principle of rationalism which absolutely banishes religion from the sphere of politics. Pointing to the example set by England, he regrets that France did not adopt Protestantism three hundred years ago. Protestantism which is a compromise between Catholicism and Free-thought, just as constitutional government is a compromise between absolute Monarchy and a Republic.

The title which M. Alphonse Esquiros has selected for his book† shows sufficiently on what delicate ground he is treading. He discusses with becoming gravity a topic which is rightly deemed one of the weightiest problems of civilization, and we cannot understand why certain journalists belonging to the Catholic party looked upon the work as encouraging vice; much less do we see what reasons the Government of Louis Philippe had to prosecute and imprison M. Esquiros for what is essentially a moral work, whilst at the same time Eugène Sue's *Mystères de Paris* and Balzac's *Corsaire Venge* were tolerated and advertised in all the French newspapers.

M. Paul Stapfer's second article on Beaumarchais is undoubtedly one of the best papers in the *Bibliothèque universelle* for August.‡ It treats chiefly of the celebrated writer's journey to England for the purpose of destroying a scurrilous pamphlet published against the French Government and chiefly against Queen Marie Antoinette; it then follows him into Germany, describes his tragic adventure in the forest of Neustadt, and his interview with the Empress Maria Theresa. In preparing this part of his sketch M. Stapfer has availed himself not only of M. de Loménie's work, but also of M. d'Arnet's *Beaumarchais und Sonnenfels*, a pamphlet which has lately been condensed into French and illustrated with comments by M. Paul Huot.

SEÑOR CASTELAR'S MINISTRY.

SEÑOR CASTELAR has at last assumed the conduct of an enterprise for which he was primarily responsible. To maintain the name and form of a Republic without destroying society as it existed under the Monarchy, has been the ambition of his life. If he can now accomplish the task, he will, at the cost of enormous temporary calamities, have at the most left his country as well off as he found it. During the conflicts and amidst the disappointments of the last few months, CASTELAR has probably learned some of the most indispensable lessons of politics and government. The Republican party, of which he was by character and ability the legitimate leader, professed, with his sanction, to assert a divine right of supremacy, apart from expediency and independent of the will of the majority of the nation. To the institutions which had been established or recognized by the constituent Cortes, as to the authority of previous Governments, the Republicans and their eloquent chief only submitted under protest and compulsion. They announced at all times that they would take the first opportunity of realizing their sacred creed in practice, and, when the plots of various factions against King AMADO had created a vacancy in the supreme power, CASTELAR was one of the first to proclaim the long-expected Republic. The Ministry in which he held a considerable place effected in the first instance to derive its mandate from the Cortes, and CASTELAR himself would probably have been glad to maintain the compromise by which all Liberal parties took a share in the Government. Soon afterwards, at the dictation of a street mob, the Republicans expelled their Radical colleagues from office, and at a later period they superseded the Assembly, and assumed a provisional Dictatorship to last till the convocation of a new Cortes. The next change was the flight of FIGUERAS, the retirement of CASTELAR, and the accession of PI Y MARGALL to power. Anarchy was now at its height, as upstart Governments in various parts of Spain began to practise the Federalism about which CASTELAR and his associates had merely talked. The Cortes were powerless, the Ministers were convicted of incapacity and suspected of treason; and after one of their number had proclaimed the doctrine that rebels of his own political persuasion were entitled to perpetual immunity from the legal penalties of rebellion, Señor SALMERON exercised the powers of government with, for the first time since the proclamation of the Republic, a certain display of honesty and vigour. Although the Ministers were unable seriously to check the progress of the Carlists in the North, they succeeded in repressing insurrections in Seville, in Valencia, and in other towns. Their forces have hitherto been insufficient for an attack on Carthage, and the rebel Government enjoys the singular advantage of superiority at sea.

Señor SALMERON, despairing probably of re-establishing civil and military order, has resigned on the strange pretext of an insuperable objection to the infliction of capital punishment. Assassins and assassins seem to form the only class which in Spain is entitled to immunity from violent death. Throughout the South of Europe objections to capital punishment sensibly indicate a sentimental ferocity which is only checked by the compensation of severity with judicial regularity and balance. By making way for CASTELAR, who is less conspicuous in his regard for criminal life, SALMERON seems to have admitted that the punishment which he derives from inflicting is nevertheless both just and necessary. If the Carlists and the Madrid rebels are to be suppressed, an army must be

formed and rendered efficient by discipline; and unless mutineers are summarily shot, it is idle to hope for obedience or for victory. The majority of the Cortes which elected CASTELAR numbered two to one; but it is unnecessary to learn that more than sixty members voted for PI Y MARGALL, in spite of his unconscious or voluntary complicity with the insurgents. In his speech after his acceptance of office the Minister dwelt on the criminal violence of the demagogues, and on the necessity of restoring discipline even by means of capital punishment. He has determined to call out the Reserves to the number of 150,000 men, and to arm in addition 500,000 Militiamen; and if his efforts prove successful, he ought to be able to terminate both the Carlist war and the Southern rebellion in the course of the present year. For Republics as for Monarchies irresistible force is the first condition of government. If the various armed bands which disturb the tranquillity of Spain can be dispersed or destroyed, it may perhaps be possible to begin civil government from the beginning. The Republicans in Opposition succeeded in demoralizing the army, and it is right that they should experience the difficulty of undoing their own mischievous work. For the present the levies which are to end the war exist only on paper or in the speeches of the Minister. Half a million of Militiamen will probably be bent on massacring one another; but it is possible that the materials of a regular army may still be discovered.

The most encouraging occurrence for the country, if not for the Republic, is the return to public life of some important political oxen. Since the overthrow of the Monarchy, Spain has been exclusively ruled by a fraction of a party which itself formed a minority of the nation. The Ministers and generals who had previously conducted civil and military affairs have been compelled, either to seek refuge abroad or to conceal themselves from observation. It is now announced that Marshal SERRANO has arrived at Madrid to accept a high military command; that General CÓNCHA is to undertake the reduction of Carthage, and that SAGASTA is expected to return to the capital. It is the plain duty of all responsible Spaniards to aid any honest Government in the repression of anarchy and in the conduct of the war against the Carlists; but the genuine Republicans can scarcely fail to perceive that their supremacy is compromised by the acceptance of the services of the former partisans of Monarchy. It may be assumed that SERRANO will render loyal service to any Government from which he accepts a commission; but if he succeeds in putting down the Carlist insurrection, he and those who share his opinions will have an undoubted right to a voice in the determination of the future form of government. The claims of the Republic were comparatively plausible before the experiment had been tried. It will now be reduced to throw itself on the protection of military chiefs who will owe it only provisional and temporary obedience. It is impossible to deny that the establishment of the Federal Republic was the immediate cause of the partial dissolution of the army, and of the secession of entire provinces from the State. Within the last week the Socialists of a district near Madrid have divided among themselves the lands of the village, after imprisoning the municipal authorities; and a successful insurrection has taken place at a town in Galicia. No scruple ought to prevent a general in command of a victorious army from taking measures to terminate chronic and sporadic rebellion. One probable result of the existing confusion may be the restoration of the dynasty of ISABELLA in the person of her son. The title of Don CASTELAR may perhaps be equally good; but absolute monarchy and clerical supremacy would be unworkable

even to a population which has groaned under the impotence of the Federal Republic.

It is not yet known whether the English Government will restore to the Madrid authorities the vessels which were hastily seized in the neighbourhood of Carthagena. It would be impossible to comply with the original demand of the Republican Government that the *Vittoria* and *Almansa* should be treated as pirates. The capture of the ships, if it is followed by a transfer into the possession of the central authorities, will have been a distinct act of interference in civil war. On the other hand, the present Government of Carthagena has no recognized existence; and a foreign Power may treat its public property according to its discretion. The best course would be to retain for the present ships which ought never to have been captured. It may at least be hoped that no favour will be conferred on the Republican Government until it has made reparation for the illegal seizure of the *Deerhound*. It is intolerable that an English ship should be captured on the high seas by a foreign cruiser in time of peace. The Republican Government would probably have objected to a concession by England of belligerent rights to the Carlists; and no other measure could give the Republic a right to capture contraband at sea. As far as the crew is concerned, the case is ruled by the precedent of the *Uglieri*, and the claim for redress is certainly not weakened by the fact that in the present instance the vessel also was English. The monstrous pretension to deal with the master and crew as pirates is utterly inadmissible. No Spanish Court or prosecutor would pretend to believe that the *Deerhound* was engaged in the plunder of peaceable vessels. The operation of carrying warlike supplies to the Carlists would have justified seizure and condemnation in Spanish waters; but the trade in arms beyond Spanish jurisdiction is lawful, nor can it involve any forfeiture of the right of English interests and English property to protection. It was to prevent complications of this kind that the QUEEN'S Proclamation of Neutrality was issued at the beginning of the American Civil War. The scandalous and arrogant injustice of the remonstrances which followed require no comment beyond the history of the *Deerhound*. In this case the English Government will scarcely consent to another Geneva Arbitration.

FRANCE.

IT is hard to say whether the Count of PARIS was well advised in going to Frohsdorf when he did, or would have been better advised if he had put off his visit till October. Coming at the beginning of the vacation, the interview between the two Princes had the effect, no doubt, of giving the Royalists of both sections a definite object to work for during the autumn. For the leaders on both sides it would have been enough to be informed in confidence that the reconciliation was determined on, and would be publicly proclaimed at the most convenient moment. But this fact could not have been communicated to the rank and file, and without this knowledge Orleanists and Legitimists would alike have spent the recess in aimless speculations as to the real intentions of their respective chiefs. On the other hand, too long an interval between the declaration of war and the first battle is often a misfortune for the attacking party. It gives them time to ponder over the difficulties that lie before them, and to find out how ill prepared they are to meet them. Discoveries of this kind may be valuable to the general, but to the common soldier they are simply discouraging. He can make no use of the knowledge when he has obtained it; he can only feel his hopes of success growing fainter every day, until in the end perhaps he is defeated mainly by his own faintheartedness. There are some signs that this process is going on among the partisans of the Frœn. At first they were confident and excited. The initial obstacle to a restoration had been triumphantly got over, and there was nothing before them but a course of uninterrupted success. The Count of PARIS had thrown himself at the feet of HENRY V., and in return HENRY V. had called him by the sacred name of Dauphin. After such amenities as these what more could there be to do? A formal resolution of the Assembly would declare France a legitimate and hereditary Monarchy; while another scarcely less formal would embody in a charter or constitution the gracious intentions of the Count of CHAMBORD—intentions which, by a happy coincidence, would cover the machine ground won by the Revolution of 1810. The

absence of the Assembly from Versailles made it impossible to take these simple but effective measures as soon as they were conceived. Day after day has, therefore, to be spent in inaction, and it is not surprising that, with nothing else to think about, the Fusionists begin to doubt whether, after all, everything will go quite so smoothly as they have hitherto hoped. The Count of CHAMBORD is a difficulty; the Orleanists are a difficulty; the Pope is a difficulty; Marshal MACMURON is a difficulty; the Ministry is a difficulty; the Assembly is a difficulty; the country is a difficulty. Some of them may turn out to be merely imaginary difficulties, but some at all events are likely to prove real.

Perhaps the worst difficulty of all is the Pope. The French nation is not greatly moved about PIES IX. or his self-imposed confinement in the Vatican, but there is too much reason to believe that the Count of CHAMBORD does not share its indifference. Unluckily there is no subject on which he has been so communicative. For five-and-twenty years he has been writing and talking about it, and everything that he has said and written has now been searched for and republished. It is not easy for a Most Christian King to be openly worse than his word, and, as the moderate partisans of the Fusion too well know, he has those about him who will not allow any retreat from the position he has hitherto maintained to pass unnoticed. We do not envy the feelings of the followers of the Count of PARIS on reading the last Pastoral of the Archbishop of PARIS. They have no objection to the Church so long as she concerns herself about the things of another world. But the Archbishop of PARIS is not at all inclined to limit himself in this way. Except that certain theological phrases and sentiments are scattered about in it, his Pastoral might be mistaken for a furious political manifesto. It is a declaration of unceasing war on the part of the Church against Italy. There are some acts of unjust violence, says the Archbishop, which are condoned by lapse of time. But for the outrages which the Italian Government has inflicted on the common father of Christendom no such condonation is possible. Time does but make the evil consequences of them more apparent, and the duty of repairing these disasters by removing their cause is continually becoming more imperative upon all Christian men. The Church can never cease in her efforts to restore Rome to the Pope and the Pope to Rome until the great end is accomplished. The Archbishop does not say how it is to come to pass; he only invites faithful Catholics to be instant in prayer for the Pope. But those among the Fusionists who have no wish to see Italy driven into the arms of Germany, and France embarked once more in a hopeless struggle against modern ideas, may well be uneasy at the Archbishop's exhortations to devotion. If the Count of CHAMBORD becomes King, it is among men of the Archbishop's way of thinking, only even more violent in their manner of expressing their thoughts, that he will choose his most trusted counsellors. Even if it be granted that his lay advisers will be of a more prudent temper, who is to say how much weight an Ultramontane sovereign, attributing his restoration to the answered prayers of pious Catholics, will attach to the counsel of his Ministers, and how much to the admonitions of his director? And even if the impossibility of moving to any good purpose should keep him quiet as regards Italian affairs, what kind of home policy is to be expected from men animated by the ideas which appear in the Archbishop's Pastoral? On the principle "*Nallum tempus occurrat ecclesie*" what French institution is safe? The same sort of reasoning which argues that Italy has met with nothing but disasters since she quarrelled with the Pope may prove that France has been equally unfortunate since the Revolution deprived the Church of her lands and made her a mere pensioner of the State. A reactionary Government may find it as hard to stop in its headlong retreat as a revolutionary Government in its headlong advance. These are not cheerful reflections for an Orleanist shopkeeper, and he has still another two months in which to indulge them.

With affairs in this position, it is well that the PRINCE IMPERIAL is not yet old enough to have shown any character of his own. At present an Imperialist restoration means a Regency; and though the Empress might be more amenable to her Ministers than the Count of CHAMBORD, her devotion to the Pope is hardly less conspicuous. Indeed the Pope, by all accounts, is by no means certain whether it would suit his views best to see France a Kingdom or an Empire. If he congratulated the Count of

CHAMBORD upon the visit of his cousin, he sent a special blessing to the PRINCE IMPERIAL, and he is not known to have expressed any displeasure at the political use which the Imperial chaplain made of it. Had it been otherwise, it is far from impossible that the moderate Royalists might have turned to the Empire as a less dangerous form of Monarchy than the legitimate and hereditary kingship represented by the Count of CHAMBORD. NAPOLEON III. was a sufficiently pious sovereign, and throughout his reign he was, outwardly at least, on good terms with the Church. But he showed, when occasion demanded it, that whenever the interests of France pointed one way and the interests of the Pope another, the Pope had to content himself with civil speeches, while France got the solid pudding. This is precisely the amount of religion which the Orleanist party like to see introduced into politics. They have no love for Italy and they are probably more than willing that the Pope should regain his dominions, provided that it be done at somebody else's cost. But they wish the Church to be kept in her place, and to be made to understand that when political questions of real importance are under discussion she must not expect to be thought of until France has done the best she can for herself. NAPOLEON III. knew how to do this, and if the successor to his pretensions had given signs of inheriting his capacity, he might have profited by the uncertainty which rests upon the Count of CHAMBORD's intention in matters ecclesiastical.

Meanwhile the solid benefit which M. THIERS has conferred upon France is on the eve of being gathered in. The Germans are evacuating, or are on the point of evacuating, Verdun, and by the end of next week French territory will once more be occupied only by French troops. How sincerely grateful the Monarchical party are to the statesman by whose reputation and labours this result has mainly been brought about may be judged from a singular correspondence which has just passed between M. JULES FERRY and one M. HUIN, who is the President of an Agricultural Society at St. Dié, in the Department of the Vosges. At the annual dinner of this Society M. FERRY was asked to propose a toast, and in accordance, it seems, with custom, the President wrote to inquire whose health he meant to drink. M. FERRY replied that he intended to give the health of M. THIERS, but not to introduce any politics into his speech. M. HUIN immediately wrote to say that, as M. THIERS's name has unfortunately been made a pretext for agitation, and is even shouted by the very Communists who burnt his house, the toast must not be drunk. This is the true Royalist notion of a Conservative policy. He that is not with the Monarchists must be set down, not merely as against them, but as against law, order, property, family, and all the rest of it. They have modelled their politics on their religion, and can admit no middle term between accepting everything and rejecting everything. It is this temper that has already subjected France to so many revolutions; and if the Royalists are strong enough to achieve their object, it will probably be the cause of as many more.

THE OLD ERA AND THE NEW.

THE result of the Renfrewshire election shows that the tide of popular opinion is still running strongly against the Ministry, and it is the more significant because in Scotland the tendency has hitherto been supposed to be decidedly the other way. Renfrewshire is not a close county governed by the dictation of powerful proprietors. It derives a considerable tinge of Radicalism from Glasgow, the inhabitants are thriving and independent, and in any case the Ballot has enabled them to give effect to their opinions with perfect freedom. The seat was lately occupied not only by a Liberal, but by an important member of the Government; and it is now held by a Conservative. It would appear that at least two of Mr. GLADSTONE's colleagues failed to command the confidence of their constituents, for the late Home Secretary and the Parliamentary Secretary to the Treasury have both been succeeded by opponents of the Ministry. The rival candidates in Renfrewshire are both Colonels, and their political opinions are almost identical. Except by looking at the name at the head of the page, it was scarcely possible to distinguish an address by Colonel MURK from an address by Colonel CAMPBELL. The only difference between the two gentlemen was that Colonel MURK was a supporter of Mr. Gladstone and Colonel CAMPBELL was not, and that was

enough to settle the question between them. The election proves that in Scotland as in England people are getting very sick of the present Cabinet, and distrust and dislike it; but it would be hazardous to say that it is, in any substantial sense, an indication of a Conservative reaction. It may be doubted whether there is really in Scotland anything like Conservatism as it is preached by Conservative orators and journalists in the South. Most Scotchmen are, by instinct and education, Liberals; and their hereditary common sense, which restrains them from Radical excesses, discovers only matter for contempt and ridicule in the childish mock heroics androdomontade of the followers of Mr. DISRAELI. Even in its most highly coloured form Scotch Conservatism is but a mild affair, and scarcely goes beyond moderate Whiggery. The return of Colonel CAMPBELL is an unequivocal proof of the general unpopularity of the Government; but there is no reason to suppose that it is a sign of a reaction from Liberal opinions.

At such a moment the question whether Mr. GLADSTONE himself retains the confidence of his constituents is naturally a tempting subject of speculation. An apparently semi-official announcement in the *Daily Telegraph* shifts the grounds upon which it is held to be unnecessary for the PREMIER to vacate his seat. It was at first contended that, as Mr. GLADSTONE was not to receive any salary as Chancellor of the Exchequer, that office was not, as far as he was concerned, an office of profit under the Crown. Since then it has been discovered that in 1834 Sir ROBERT PEEL, in accordance with the report of a Committee of the House of Commons which sat three years earlier, drew his whole salary as First Lord of the Treasury and half the salary of the Chancellor of the Exchequer, together 7,500l.; and it is stated that Mr. GLADSTONE has resolved to follow this precedent. It is obvious that the Chancellorship thus becomes an office of profit, since it yields 2,500l. a year, and the original argument against the necessity of a new election falls to the ground. It has now, therefore, been found necessary to explain that "the sole reason why the PREMIER has not vacated his seat is that his acceptance of two offices instead of one is manifestly one of the cases contemplated by the spirit, at least, if not the letter, of the amended Act passed a few years ago." It will be remembered that in the case of the COLLIER and Ewelme scandals the letter of the law furnished a pretext for evading its spirit; but now, as the letter does not happen to suit, the spirit is preferred. Delicacy of conscience is sometimes shown less in discharging obligations than in contriving the means of avoiding the sacrifices which they involve. The defeat of the Head of the Government might be an awkward incident; but there is a more serious awkwardness in the spectacle of a Government exhausting its subtlety in slippery interpretations of the law, adapted to the personal exigencies of the hour. The simple and natural course in a doubtful case would be to obey the law as it stands, until there is an opportunity of amending it.

It will be interesting to observe what effect these successive and undeviating defeats will have upon the policy of the Ministry. Mr. LOWE at the Cutlers' Feast confined himself to a glorification of the past, and Mr. BRIDGES is not to speak until next month. In the interval the utterances of even Mr. W. H. GLADSTONE may perhaps deserve attention. It is an amusing illustration of the general unpleasantness of politics—particularly Government politics—just now, that the Liberals of Whitby were rather afraid that anything young Mr. GLADSTONE could say would be apt to drive away summer visitors and injure the jet trade, the purchase of that dismal article apparently demanding a cheerful mind; and he had therefore to promise, before he was allowed to speak, that he would say as little as possible. Accordingly he alluded particularly to the jet trade, the "visiting season, the herring fishery, and the iron ship-building trade," and as little particularly as possible to everything else. In spite of himself, however, he stumbled into some curious and significant disclosures. Mr. LOWE in his speech at Sheffield went on the assumption that he had been transferred from the Exchequer to the Home Office in consequence of having triumphantly exhausted the possibilities of usefulness in the former department. There were no more worlds to conquer on that side of the street, and so he went over the way. It must have occurred to everybody that it was an odd mistake to remove so successful an administrator from an office in which he had so greatly distinguished himself; but the son of the PREMIER, who it must be presumed, knows something

of his father's mind, gives a very different version of the transaction. There had been, he said, "certain irregularities and inconsistencies in certain departments"—in other words, a mess at the Treasury—"and it was in order to reinforce and make them perfect, as far as possible, that various changes in the *personnel* of the Government had been made." Now that his father had taken upon himself the Chancellorship of the Exchequer, and Mr. BRIGHT was coming back, and Mr. Lowe had been put into a hole at the Home Office, "the timbers of the ship"—an allusion intended probably to conciliate the shipbuilding trade—"were sounder, and its seams well caulked." It would appear, therefore, that Mr. Lowe's destiny, in the opinion of his colleagues, has sunk into being useful only for caulking purposes. He stops a hole to keep the wind away. On other subjects Mr. W. H. GLADSTONE, in deference to the feelings of bathers and the interests of the jet trade, touched as lightly as he could. He referred vaguely to the education question, but "at the present moment he was not prepared to state what were the precise views and intentions of the Government in this matter." All he could say was, that "he was convinced that the utmost would be done to secure justice to all." He added that, as to the disestablishment of the Church of England, his father felt that this was a question for the new era, while he was the leader of the old era, which was quickly drawing to a close. An ecclesiastical revolution is, it seems, to be the next great question, but Mr. GLADSTONE modestly suggests, not that there is anything to be said on behalf of the Church, but that its destruction should be left to another leader. It would appear that the PREMIER, in confidential intercourse with his family, if not with his colleagues, is still harping on the old note of morbid unrest and perpetual change. He singles out the quarry, although he professes to be too old and stiff to join in the chase. It is just possible that, if the sport were once started, the weary huntsman might find his energies restored.

It is impossible to look back over Mr. GLADSTONE's strange political career without remarking that in his time he has managed to use up a good many old eras, and to adapt himself with singular elasticity of sentiment and conviction to a good many new ones. It was observed not long ago by a very philosophical Radical that, though Mr. GLADSTONE was generally to be found lagging behind his party, and indeed went over most of the ground with his head turned the other way, he always managed to get pulled up to them at a critical moment. During Lord PALMERSTON's Ministry, and while Lord RUSSELL still stood between him and the leadership of the Liberal party, Mr. GLADSTONE was apparently under the impression that the Irish Church question, the Irish Land question, and the Ballot belonged to a future era with which he had nothing to do. Yet very soon afterwards he felt no insuperable difficulty in precipitating the advent of an era in which he had an opportunity of playing a prominent part. His opinions suddenly crystallized with a rapidity which must have been exceedingly convenient for the party exigencies of the moment. The first influence of the defeats which the Government has lately sustained would seem to have been to produce a disposition towards quiet and inaction, but it is not improbable that, as they continue, they may have an opposite effect. It is evident that the classes who desire quiet distrust the intention or capacity of Mr. GLADSTONE and his colleagues to secure it; and if the latter find that it is hopeless to obtain acceptance on those terms, they may be tempted to try another tack. It has been announced by what is called a Press Association that Mr. GLADSTONE is in the autumn to visit Ireland, and to proclaim an amnesty to the Fenian prisoners. The statement, as far as we are aware, has not been contradicted; but it is of course incredible. That Mr. GLADSTONE, with characteristic restlessness and meddlesomeness, may undertake an oratorical expedition to Ireland is not impossible; but that, after his repeated declarations in regard to the Fenian prisoners, and his unanswerable vindication of the justice of their punishment, he should now turn round and pronounce an amnesty, is a thing which cannot be believed until it has actually happened. The announcement, however, though erroneous in fact, may not be without some significance, especially when taken in conjunction with Mr. W. H. GLADSTONE's prediction of a new era of volcanic politics, in which the explosion of the Church is to be a prominent feature. It will not perhaps be very surprising if an attempt is made to launch the country upon another course

of sensational legislation and heroic topsy-turviness. There is, however, some security for a breathing space of rest in the fact that the Government has pretty well exhausted the subjects which it found ready to its hand, and that new questions must have time to ripen and develop. Perhaps the most mischievous of the fallacies with which Mr. Lowe built up his singular apologia was the assumption that great national changes can be effected offhand by merely passing Acts of Parliament. An Act of Parliament is really only an egg which has to be hatched; and what is now wanted is not a cackling but a sitting hen.

ITALY, AUSTRIA, AND GERMANY.

AMONG many Royal visits of recent times none has been more judicious or more appropriate than the impending visits of the King of ITALY to the Imperial Courts of Vienna and Berlin. For many years resentment, ambition, and patriotism combined to make VICTOR EMMANUEL the enemy of Austria. He ascended the throne with the determination to avenge Novara and the slight which had been offered by the victor to his father. A few years later he was enabled by the aid of a powerful ally to annex Lombardy and the adjacent Duchies; and the later acquisition of Naples was an additional menace to the Power which retained its dominion over the only Italian provinces which were not included in the new kingdom. By an extraordinary stroke of fortune, it suited the purpose of Prussia to complete the work which had been commenced by France; and it was perhaps well that neither the interests nor the national pride of Austria were seriously affected by the final loss of Venice and the rest of her Italian territory. The Quadrilateral had been defended in 1866 rather as a point of honour than for reasons of policy; and the compulsory evacuation was preceded by successful battles both by land and by sea. With the consolidation of the Italian Kingdom and the retirement of Austria from the Peninsula all cause for hostility between the neighbouring Powers proved to be at an end; and the ancient connexion by blood and alliance naturally resumed its influence. During the long struggle for independence the Italian Government had become irreconcilably embroiled with the See of Rome, which had formerly relied on Austrian power for the maintenance of its temporal dominion. If no other change had taken place, the Government of Vienna might have thought it necessary to adopt the policy which is now urged on the French Assembly by a large section of the majority. A claim to the Protectorate of the Church might have been more troublesome to the Italian Government than the vicinity of a formidable and alien Power on the coast of the Adriatic; but happily the course of events, precipitated by the rashness of the Pope, had detached Austria as well as Italy from his cause. The Emperor FRANCIS JOSEPH sacrificed his personal inclinations and the policy of his youth to the interests of his Empire; and soon after the loss of Venetia a Protestant Prime Minister undertook the direction of Austrian affairs. While France, and even Spain, has repeatedly interfered on behalf of the temporal power, Austria has tacitly acquiesced in the Italian occupation of Rome. The Exhibition furnishes a suitable excuse for a visit of the King of ITALY to Vienna, and the consequent interchange of courtesies will symbolize and ratify the re-establishment of friendly relations. Between 1820 and 1848 a whole literature of invective and lamentation expressed the repugnance of the cultivated class of Italians to the presence of the Teutonic foreigner on their soil. The greatest Italian writer of the time reproached the "conscience-stricken sallow Savoyard" with his attendance in the train of the Emperor FERDINAND at Milan. No patriot, however sensitive, will disapprove of the presence of the son of CHARLES ALBERT at Vienna.

The King is supposed to have felt some hesitation in accepting the invitation to proceed to Berlin. It is not to be supposed that mere dislike to a prolongation of courtly ceremonies could interfere with the performance of political duty. With the personal tastes of a sportsman, VICTOR EMMANUEL is one of the most serious, as he has been one of the most successful, of politicians. His rough simplicity of demeanour never interfered with his ability to profit by the statesmanlike astuteness of CAVOUR, or by the convenient tamerity of GARIBOLDI. The sacrifice of a week or fortnight of amusement would be a trifling consideration for the establishment of a cordial understanding with Germany.

It may perhaps have been with a proper regard to the susceptibilities of France that the KING postponed his acceptance of the invitation to Berlin, that he might seem to yield to the prudent urgency of his Ministers. It is well known that the Imperial Government has little reason for personal gratitude to the KING. Although Prussia had contributed to his aggrandizement almost as largely as France, and notwithstanding the identity of the interests of both countries in opposing Papal claims, VICTOR EMMANUEL proposed to his Ministers in 1870 to send a contingent to join the French army. It will probably be always uncertain whether the KING's impolitic proposal was made in earnest. It was perhaps against his own will that he took the opportunity of the overthrow of the French Empire to occupy Rome, and afterwards to transfer the seat of government to the ancient capital; but the piancy which waives a simple, and at the same time secures a material advantage, generally admits of a double interpretation. It is certain that the predominance of Germany in Europe affords the best security against an ecclesiastical reaction in Italy. The vigorous resistance of the German CHANCELLOR to the extravagant pretensions of the Papacy diverts attention from the offences of the POPE's "Subalpine" enemy. All but the most excited Catholics know that the supposed imprisonment of the POPE by the King of ITALY is a metaphorical fiction; while the laws which have been passed by the German Parliament in restriction of the rights claimed by the priesthood are enforced with uncompromising rigour. RICASOLI's experiment of "a free Church in a free State" has been tried in Italy with perfect good faith, but also without success. The German Government asserts the freedom and the supremacy of the State, without regard to any pretension of the Church to independence. The Italian Catholics are by tradition and education more hostile to the Papacy than their co-religionists in Germany, but their Government is less powerful and less resolute than the heretical rulers of the Empire. It is for the interest of Italy that French pilgrims should distribute their prayers and imprecations between the schismatical tyrants of Berlin and the apostate usurpers who violate the sanctity of Rome. Although the Italians would gladly remain neutral in any future Continental war, the force of circumstances may not improbably drive them into a German alliance. The clerical party in France openly avows the policy of replacing the POPE in the possession of his former dominions; and although M. THIERS repudiated all intention of interference with Italy, his authority may be quoted for the doctrine that it is the duty and interest of France to defend the temporal independence of the Holy See. If the legitimate Monarchy of the BOURBONS were re-established, the party which would then be dominant must, in consistency with its professions, make some effort to revive the French protectorate in Rome; nor is it certain that, if the BONAPARTES once more ascended the throne, they also might not be tempted to gratify the national vanity by continuing the Italian policy of NAPOLEON III. An unequal struggle would be most effectually averted by a defensive alliance between Italy and Germany. No French Minister who deserved the name of a statesman would attempt the restoration of the POPE, at the risk of renewing and exceeding the calamities of the last German war.

When Continental sovereigns in the present day meet for purposes of pleasure and business, they probably remember that they have all a common interest which may well outweigh national jealousies and grounds of conflict. In all parts of Europe revolution and anarchy are awaiting the opportunity which they have found in Spain. Two great States are at the present moment subject to Republican Governments, and socialistic democracy is active and vigilant in Germany, in Austria, and in Italy, and, under other forms, in Russia. While ecclesiastical aggression is but a transitory inconvenience, revolution is a permanent danger. The King of ITALY, and even the German EMPEROR, may laugh at the fulminations of the POPE; but the establishment of Republics in other parts of Europe is not more impossible than it might have seemed a few years ago in France and Spain. It is not desirable that existing Governments should concert with one another measures of coercion, but they may find in the menaces of a common enemy reasons for avoiding quarrels among themselves. The chief Royal personages of the present day cannot be charged with indolence or personal insignificance. Neither the King of ITALY nor the German EMPEROR can be considered to possess either military or political genius of the highest order; but both have commanded armies in the field, one with credit

and one with glory; both have known how to avail themselves of the services of consummate statesmen, and both have contributed largely to the creation of the powerful monarchies over which they respectively preside. The Emperor WILLIAM and King VICTOR EMMANUEL possess in common the attribute of manliness, as well as the ordinary gift of personal bravery. Historians, while they justly assign the chief merit of creating Italy and Germany to CAVOUR and BISMARCK, will not fail to record the loyal devotion of the reigning Sovereigns to the national cause in both countries. If the King of ITALY finds little pleasure in the magnificent hospitalities of Berlin and Potsdam, he can scarcely fail to take a warm professional interest in the first army in Europe. The reviews with which Royal guests are entertained at Continental Courts will not be merely ornamental pageants in the eyes of VICTOR EMMANUEL. It may be hoped that he will not be disturbed by envy of the magnitude of Austrian and German armaments, or tempted into a costly and impracticable rivalry.

ARCHBISHOP MANNING ON IRELAND.

IT is natural that Archbishop MANNING should look with exultation on the religious condition of Ireland. It is the one country in Europe in which the Roman Catholic Church is really flourishing. The Archbishop is too shrewd a politician to place much trust in the present reaction in France, and in Germany, Italy, and Spain he sees even less ground for hope. In his letter to the Roman Catholic Primate of Ireland he declares that the Monarchies "have sold themselves, and are morally gone"; and certainly the nations seem ready to follow the example of the Monarchies. It is not in Archbishop MANNING'S line to draw conclusions which would not be approved at Rome, but in his own mind he has perhaps already recognized the lesson which this contrast forcibly suggests. Ireland is the one Catholic country in which for three hundred years the State has not been Catholic; consequently it is the one Catholic country in which the Church has not been tempted to ally herself inextricably to the Monarchy. If she had held as loosely by the Monarchy in France as she has in Ireland, she would not have shared its fate at the Revolution, and the ideas of 1789 might not have been so largely coloured by irreligion. Under the Orleansist Monarchy the Church was not in favour at Court, and the result of this short interval of moral independence was seen in the revived popularity of the clergy about 1848. But the alliance of the Empire had charms which she could not resist, and hatred to every religious institution has again become the recognized badge of advanced Republicans. Ultramontanism and Republicanism have this in common, that they rarely look beyond the moment. The Empire offered immediate advantages to the clergy, and to secure them they consented to stand or fall with its fortunes. The Church is hostile to Republicanism as a matter of fact, and Republicans rarely stop to consider whether her hostility is accidental or inevitable. Archbishop MANNING can have no good word to throw to the Revolution, because Pius IX. has raised the temporal power of the Pope almost to a level with his spiritual power; and so long as this position is adhered to, there can be no truce between the Church and the democratic spirit. But the example of Ireland must, we should think, suggest to him that even in Italy the Church might have chosen a more excellent way, and be reaping the benefits of it at this moment.

The Archbishop next considers what are the dangers to which Catholicism in Ireland is principally exposed. He does not much fear direct anti-Catholic legislation. The example of Germany may inflame that "handful of boisterous and blustering doctrinaires who are trying to turn men away from doing what is just towards Ireland by grandiloquent phrases about the Imperial race and the Imperial policy;" but the work of subjecting Ireland to the religious ideas of England will prove, he thinks, too tough for them. We have little doubt that in this respect Dr. MANNING is right. A policy of persecution cannot be effectively persevered in when those who preach it have first to persuade people that it is not the thing it looks. There was no such squeamishness in the days of the Tudors. Then men of all parties persecuted freely, and would have thought themselves greatly to blame if they had not persecuted. Now, even in Germany, it is thought needful to find an excuse for every harsh measure which is adopted

towards the Church. The Government is acting in pure self-defence; it has no hostility to the Roman Catholic religion or the Roman Catholic clergy; it only asks to be allowed to live at peace with them; it is bound to make the Empire safe against its foes, and its religious legislation is directed solely to this object. These are the pleas put forward in defence of acts which three centuries back would not have been thought to need excuse; and if even in Germany, where men are not much accustomed to criticize the acts of their rulers, it is necessary to concede thus much to public feeling, how much more necessary would it be in England, where the whole tradition of the dominant party is opposed to this kind of legislation. Persecution which has to be glossed over and apologized for stands but a poor chance of being carried on with any vigour or consistency. If there is any cause to feel alarmed for the prospects of Irish Catholicism, it lies, Dr. MANNING thinks, in the possibility of education being secularized. Those who desire to rid the world of religion "know perfectly well that the school is more fatal to their policy than the Church." As regards elementary education, Archbishop MANNING makes one very curious remark:—"We in England," he says, "were upon the brink of being terrified by agitation and juggled by Leagues into some compromise. . . . The danger is, I hope, past, because the momentary scare is over, and the weakness of the agitation is found out." It seems from this there was a time when the English Roman Catholic authorities were not altogether unwilling to come to terms with the Secularists. Probably they were more afraid of unsectarian education than of secular education, and were willing to give up their control of purely secular instruction in order to be rid of the Bible without note or comment. Now they see that the unsectarian party has no real hold on the country, and that the battle will lie between Denominationalism and Secularism. Upon the issue thus stated they have come to the same conclusion as the Anglican clergy, and, as it seems to us, with even less reason. The number of Roman Catholic children in Protestant schools must be very considerable; and it would surely have been wiser if the Roman Catholic clergy had supported a system under which they would have had free access to every elementary school in which Roman Catholic children were being educated, instead of clinging to a system under which, though some Roman Catholic children are educated under Roman Catholic management, others necessarily learn to regard religion as something altogether separate from their school-life. We have before now said much the same thing as regards the Anglican clergy, and, in so far as Secularism fairly carried out would set free a great part of the funds which now go to maintain secular teaching, the argument is equally applicable to both. But the position of the Roman Catholic Church in England differs from that of the Anglican Church in two important respects. It is a poor Church, and it is a Church whose adherents are widely scattered. It is no wonder that Roman Catholics should be in favour of voluntary schools in Liverpool, where there are Irish children enough to fill as many Catholic schools as the priests can find the money to build. But there are many places where a Roman Catholic school is an impossibility, because there are no more Roman Catholic children than would make up a single class. Education must be found for these children in some school or other. Under the present system they go either to a School Board school or to a Church of England school, and the priest has no opportunity of getting at them except in their own homes. Under a secular system he would have certain hours in the week allotted to him, during which he would have the use of the school building for the purpose of giving religious instruction. This is the danger which Dr. MANNING thankfully declares is now past.

As regards Ireland the danger dreaded by the Archbishop lies in the higher education. Popular education he considers safe, "not through any favour of Legislature, but through the fidelity and industry of the Catholic Church and its people." But before the higher education can be at once adequate and Catholic, England and Scotland must cease to legislate for Ireland according to English and Scotch interests and prejudices. In other words, Dr. MANNING is prepared to make common cause with the Irish bishops, and to declare that no solution of the Irish University question will be satisfactory which does not charter and endow a Catholic University. When Mr.

GLADSTONE'S Irish University Bill was first introduced, the Archbishop admits that he thought well of it. As soon, however, as he knew that the Irish bishops had rejected Mr. GLADSTONE'S proposals, he saw that his first impression had been mistaken. "Such mixed and godless schemes of University education have become inevitable in England by reason of our endless religious contentions. England has lost its religious unity, and is paying the grievous penalty." Ireland has not forfeited its religious unity, consequently Parliament is bound to legislate for Ireland according to the ideas and conscience of the Irish people. It is a little surprising to have Ireland held up to us as an example of religious unity; but even if we accept the assertion, it cannot be said entirely to close the controversy. Ireland is an integral part of the United Kingdom, and however much liberal and enlightened politicians may desire to legislate in accordance with Irish ideas and consciences, they have to bear in mind that such legislation is impossible unless some deference is paid to the ideas and conscience of the other parts of the Empire. Dr. MANNING sets up a claim which to many persons will seem hardly distinguishable from Home Rule. He does not propose, indeed, that there shall be three separate Parliaments for England, Scotland, and Ireland, but he insists that, as regards the internal affairs of each kingdom, the Imperial Parliament shall allow its legislation to be absolutely dictated by the representatives of that kingdom. That very great deference should be paid to their wishes most reasonable Liberals will admit; and we may remind Dr. MANNING that the defeated University Bill was a very different measure from what it would have been if it had been framed to carry out the views of the majority of Englishmen and Scotchmen. But when Ireland asks that, instead of a compromise in which Irish ideas shall be deferred to so far as is possible without setting English and Scotch ideas at defiance, there shall be a total surrender of English and Scotch ideas, she pushes the live-and-let-live principle to the point of extravagance. In order to strengthen his plea, Dr. MANNING assumes far too confidently that Irish ideas and wishes are altogether at one upon the subject of the higher education. "Even the Protestants and the Presbyterians of Ireland," he says, "demand that education shall be religious and Christian." Dr. MANNING'S reading of Irish Protestant opinion during the discussion of the University Bill is evidently quite opposed to ours. We should have said that the Protestants and Presbyterians of Ireland demand before all things that education, so far as the cost of it comes out of their pockets, shall not be Catholic. It is only so far as is consistent with this indispensable condition that they wish to see it religious and Christian.

THE INTERNATIONAL CONGRESS AT GENEVA.

IT is natural and right that the English newspapers which report the proceedings of the revolutionary Congresses at Geneva should more or less sympathize with the objects of the promoters, and feel or affect belief in their professions. Hostile witnesses would be reasonably regarded with suspicion and dislike, even if they were allowed to attend the meetings of these bodies. The cosmopolitan impartiality which allows journals of habitually Conservative character to fill their columns without protest with schemes for the subversion of society is happily both common and on the whole laudable. It is not desirable that the supporters of established institutions should, like some of their opponents, be one-sided fanatics. Unluckily the International Church is already split up into sects which detest one another with the utmost fervour; and reporters who hold any form of the Communist faith are bound to denounce in strong language the heresy of dissidents and schismatics. Mr. BARRY, who acted as Correspondent for the *Standard* at the International Congress of 1872, contrasts, in a preface to a republication of his reports, his enlightened Conservative employers with "the Liberal Press, the servile flunkies of the *base bourgeoisie*." Himself a devoted adherent of Mr. KARL MARX, Mr. BARRY would regard as excommunicated reprobates the managers of the present Congress; but to the less scrutinizing vision of a "*base bourgeoisie*" Bakouninists and Marxists are as indistinguishable as Burgher and Anti-Burgher Presbyterians have long appeared to Laodicean English observers. The Congress which met on the 1st of September represents a Federal organization, and repudiates the authority.

of the General Council. The Centralists are holding a Congress of their own; but perhaps the proceedings of both assemblies may not be reported with equal fulness.

At present the Geneva agitators are in no sense formidable; but it is always worth while to understand opinions and passions which may possibly become popular and dangerous. When mobs of higher social rank meet from time to time to proclaim their devotion to the Syllabus or to the Beatified MARY ALACOQUE, their extravagances interest only ill-informed alarmists, or perhaps a few curious students of the morbid pathology of human nature. Civilization has nothing to fear from Ultramontanist exaggerations; but the doctrine that all power and property ought to be transferred to the class which lives by manual labour, inasmuch as it flatters the appetites and the vanity of a numerical majority, may possibly at some time be propagated by the aid of physical force. The only point on which the Geneva Congress seems to be either unanimous or harmonious is in its enthusiastic approval of the revolt of the Uncompromising faction against the Republican Government of Spain. The Internationalists avow themselves the authors of the rebellion, and their members applaud the heroism of the garrison of Carthage. According to the statement of the Spanish delegates, the associated workmen felt no interest in the subversion of the Monarchy or in the accession to power of political Republicans. They found that they were themselves still compelled to live on their wages, and that they were expected to render obedience to the law. They consequently took advantage of civil commotions to assert their own claim to supremacy, and their associates would consistently adopt the same course if their respective countries were reduced to the condition of Spain. The contingency seems at present remote; but the doctrines of social revolution have made progress both in impunity of utterance and in their temporary embodiment in practice. The Commune of Paris, the unsuccessful rebellion of Alcoy, Malaga, Valencia, and Seville, and the defence of Carthage give the International Society an advantage in controversy analogous to the benefit which insurgents derive from a recognition of their existence as belligerents. The Congress of Geneva will probably agree with the Congress of the Hague in the proposition that the great object of the working classes ought to be the acquisition of political power; but the minuteness of sectarian jealousy is curiously illustrated by the hostility of the assembled Communists to the followers of GARIBALDI and MAZZINI. The Garibaldians are, according to the orators of the Congress, good for nothing but fighting, and as patriots they are not in sympathy with international propaganda. MAZZINI, who was in his lifetime denounced by GARIBALDI, has left to his disciples abundant warnings against the selfish and lawless doctrines of the Paris Commune and the Basle and Geneva demagogues. It would seem that among many nowfangled projects of turning the world upside down, no two are compatible with one another or capable of mutual toleration.

As Ecclesiastical Councils have generally concerned themselves rather with discipline and with declarations of doctrine than with the conversion of the outside world, International Congresses appear to be almost exclusively occupied with questions which are oddly described as legal. The validity of the credentials of delegates, the regular or irregular constitution of sections, and other internal details are discussed with an interest which seems to strangers disproportionate to their importance. The chief results of the Congress at the Hague were the excommunication of BAKOUNINE and his supporters, the transfer of the head-quarters of the Association from London to New York, and the increase of the powers of the General Council. All these measures were intended to increase the influence of MARX, who has found in BAKOUNINE a formidable rival, while among the numerous agitators of all nations assembled in London he is exposed to inconvenient opposition. GUILLAUME, a principal member of the Bakounist sect, although he was last year formally expelled from the International Society, reappears as one of the principal leaders of the Federalist faction at Geneva. The majority of the speakers complained of the usurpation of the General Council, not only on special grounds, but because authority of any kind was inconsistent with the principles of universal emancipation. As one of the orators forcibly observed, anarchy in all things was indispensable.

There is a pleasing consistency in the systematic re-

jection of voluntary obedience by professed advocates of social and political rebellion; but, unless all experience is at fault, conspiracies require, like other forms of combined activity, discipline and submission to recognized leaders. It is highly probable that the real movers of the agitation against the General Council only wish to substitute their own influence for that which MARX exercises through his little parliament at New York. The succession or flux of demagogues seems to be unaccountably rapid; and many of the original managers of the Association have become traitors in the estimation of their former followers. It is satisfactory to find that the English contingent becomes smaller and less powerful as the proceedings of the Association become more confused and chaotic. The discussions have on former occasions been held in the languages of the various speakers, with interpretations for the benefit of the rest. No other method of conducting business was consistent with the principles of an International Society; but there can be no doubt that the arrangement was in the highest degree dilatory and inconvenient. At the Hague the English delegates complained that some of the French and German speeches were not translated; and when the President explained that irrelevant declamation was better untranslated, the plainspoken Englishman replied that what was not worth translating was not worth saying. At the Federalist Congress in Geneva the discussion proceeded in French, and no better proof can be given of the decay of Internationalist doctrines in England. France, Spain, Italy, Germany, and Switzerland are regions better adapted than England to the propagation of promiscuous hostility to things in general.

The English founders of the Association had a definite and intelligible object, though they would probably have regarded with complacency social and political revolution. The leaders of the Trade Unions had begun to apprehend the tendency of a systematic increase of wages and rise of prices to discourage industry and trade; and although they were wholly untroubled by regard to the interest of the great community of consumers, they appreciated the risk of competition with themselves on the part of foreign producers. An international Trade Union might, it was thought, ensure the success of strikes by ultimately reducing all the capitalists of the world into common dependence on their workmen. When the supremacy of manual labour was once established, it would be time enough to apply the same machinery to the acquisition of exclusive political power, and to the transfer of property from the actual holders to the present receivers of wages. In a former generation the national vanity of Englishmen gratified itself by remarking that the worst of English princes had become the best of German sovereigns. A similar satisfaction may be derived from the proof that English Socialists and agitators understand their business better than the moonstruck adventurers with whom they sometimes ally themselves on the Continent. The ultimate abolition of wages may perhaps offer a seductive prospect, but an English Trade Union thinks it better in the meantime to screw up wages to the highest attainable point. America presents to the Internationalists a still more uncongenial soil than England. Some of the sections have in that free country devoted themselves to the assertion of the rights of women, to free love, and to other irrelevant or collateral doctrines; and an American delegate, whose credentials were rejected at the Hague, represented a section which favoured the election of the woman WOODHULL to the Presidency of the United States. As one of the speakers at the Hague acutely remarked, the native Americans belong essentially to the middle class, commonly known as "the base bourgeoisie." Instead of glorifying labour, they hand over hard work to the Irish, the negroes, or the Chinese, while they devote their own energies to easier and more profitable employments. There is not the smallest hope of persuading the Americans either to work by preference with their own hands or to abdicate the exercise of political power. The English working classes are numerous, powerful, and determined, but they are for the present chiefly bent on attaining economical results.

THE RAILWAY POINT OF VIEW.

THE railways are still killing people as fast as they can, and every week adds to the hecatomb of victims. The inquest on the Wigan accident has resulted in a verdict of accidental death, and a protest on the part of

the jury against the high rate of speed at which trains pass through the Wigan station. The precise origin of the accident is left in doubt, but the jury concurred with Captain TYLER in exonerating the pointsman. The meaning of the verdict would seem to be that the accident would either not have occurred, or would at least have been less disastrous, if the train had gone through Wigan station at a moderate pace. The tone of the evidence which was given by the officials of the London and North-Western Railway at this inquiry is hardly calculated to remove the apprehensions of travellers who may think of using this line. We are indebted to Mr. FINDLAY, the Assistant-Manager, for a very succinct and emphatic statement of what he calls "the railway point of view." Mr. FINDLAY is of opinion that the instruction to drivers to observe "great caution" in going through junctions does not imply any reduction of speed; that it is perfectly safe to go through Wigan Junction, which has been described as a shunting-yard, at a rate of fifty miles an hour; and that no improvement at all is wanted at Wigan. "I say this," he added, "speaking from a railway point of view"; and we know, or ought to know now, by melancholy experience, what that point of view is. In order to appreciate the spirit of this evidence, it is necessary to bear in mind the circumstances of the accident. There was, as the Coroner put it, a train "dangerously long," heavily laden, and running over dangerous ground "at a fast rate." Yet the Assistant-Manager of the London and North-Western Railway maintains that there was no reason why a driver should slacken speed in going over this ground, and states that "even after this Wigan accident the Company has not thought it necessary to make any reduction in speed or any alteration in the arrangements on the permanent way." On this point there is an apparent contradiction between the evidence of the Assistant-Manager and that of Mr. CAWKWELL, the Managing Director, who said that the Company had, since the accident, especially warned drivers to be cautious in passing through Wigan. Mr. FINDLAY, however, has explained that this really means nothing more than that drivers are to keep a look-out for signals, which, we should hope, they are bound to do, not only at Wigan, but at all stations. "Great caution," it seems, has nothing to do with speed; so that a cautious driver, dashing along over dangerous ground at fifty miles an hour, would only have the personal satisfaction, if he detected anything wrong, of knowing an instant or two before his unfortunate passengers that the train was going to inevitable smash. A train moving at that pace would of course be quite beyond immediate control. It would appear that railway managers have adopted the tenets of the Peculiar People, and do not feel at liberty to resort to merely human precautions in order to prevent passengers from being killed. Mr. FINDLAY admits that the great amount of shunting at Wigan must affect the permanent way. He admits that the incessant traffic demands greater precautions than usual, that the wear and tear is severe, and that it is "a self-evident fact" that danger increases with the rate of speed. Yet after these admissions, and after the evidence which has been given as to the state of this station, he does not hesitate to assert that the accident "does not point to a single thing which has not been done on the part of the Company which could give additional safety to passengers." It is obvious that the enlargement of a station which is admitted to be too small for the traffic, the reduction of speed over notoriously dangerous ground, and the keeping of the points and permanent way in careful repair, would have given additional safety to passengers.

The circumstances of the Wigan and other recent accidents illustrate clearly enough the "railway point of view." It is assumed that the working of Wigan Junction is quite safe because serious accidents are not constantly occurring there. It is known, however, that other accidents besides this very bad one have occurred at Wigan—indeed a second train went off the rails at the very same points within an hour or so of the disaster of the 2nd of August: and if people have not been killed on each of these occasions, that is really only an accident, in the true sense of the word. Within the last four weeks there have been five or six accidents on different lines, all of the same kind as the Wigan one—that is, the parting of a train at points. On Thursday an accident of this kind occurred on the London and North-Western at Walford. Nobody was killed, for the train was not going very fast. If it had been running at fifty miles an hour, which Mr. FINDLAY thinks is com-

patible with "great caution," there would probably have been another terrible accident. In the case of the Retford accident a verdict of manslaughter has been returned against the engine-driver; but here again we have a striking example of the recklessness which pervades the railway point of view. A level crossing is always fertile of accidents, and it is calculated that at Retford 933 trains run through the station every week, involving not less than 466 risks of collision to be averted by signals. And how are the signals set? When the crossing is not clear, the station signal is simply put at caution, while the distance signal intimates all right—at least this was so before the recent collision. In point of fact, all that the Companies aim at is not safety, but merely the chance of safety. We are assured that the London and North-Western is conducted "regardless of cost," but in reality almost all the accidents which occur are due to the desire to keep down expenses as well as to avoid trouble. Main lines are turned into goods-yards, simply because the Companies will not enlarge their stations and lay down additional lines of rail as traffic increases.

It appears that the observations which Board of Trade Inspectors and public writers feel bound to make on the accidents which are constantly occurring are not received with gratitude by railway managers. It is certainly sad work having to repeat week by week the same miserable story of disaster and destruction, and for our own part we should be glad to be relieved from it. We can only reply, however, as a French writer replied to the proposal to abolish capital punishment for murder, "Que messieurs les assassins commencent." It will be time enough to leave off protesting against the homicidal management of railways when the daily slaughter ceases. For the present it is so far from ceasing that it has not even slackened. Railway accidents are as unfailing as births, deaths, and marriages. "Another dreadful railway accident" is a standing heading in the newspapers, and reappears with shocking regularity. Last week we reckoned up the catastrophes of the previous month. In August there were three or four a week; in September there is one at least a day. On Saturday a carriage took fire on the Glasgow and Helensburgh Railway; before the train could be stopped, the passengers had to scramble out of the windows to escape being roasted, and several of them were badly hurt. On Sunday there was a momentary lull, but on Monday the work of destruction was briskly renewed. At Tanworth, the Rugby express swooped down unexpectedly on the people who were crossing from one line to another, killing a girl. "Hopes," we are told, "are entertained that this accident will induce the Railway Company to erect a foot-bridge for passengers"; but Mr. FINDLAY will no doubt be ready to prove at Tanworth, as at Wigan, that there is not a single thing which has not been done by his Company to give additional safety to passengers, and that the arrangements are simply perfect. On Tuesday three people were killed and a number injured on the South-Western, near Guildford, by a bullock getting on the line and upsetting a train. It appears that either the gate by which the bullock entered was open, or it was so low that the animal could jump over it. Bullocks are not great jumpers, and a fence that a bullock can jump is obviously inadequate. There has been a similar accident on the Somerset and Dorset Railway, but without fatal results. On Tuesday again two centre carriages of a long train jumped off the metals at Cannon Street, and, breaking away from their couplings, fell over on their sides. Happily it was a train of "empties." On Wednesday there were two more accidents, one of them, as usual, on the London and North-Western. At Walford part of a train went on one line and part on another; but fortunately the pace was moderate, and this time nobody was killed. If the driver had been going at the "great caution" speed of fifty miles an hour the result would of course have been very different. On the Great Northern an express came into collision with a train of "empties" at Wakefield; but, by luck, without fatal consequences. On Thursday there was a collision on the Great Eastern. It is important to observe that accidents are mainly due to a steady repetition of the same causes. During the last few weeks there has been a succession of accidents from facing-points, erratic goods trains and trains of "empties," and cattle on the line. In a majority of cases also the disaster might either have been prevented or its results mitigated if there had been adequate brake-power.

There is no reason to expect that any amount of re-

monstrance with the Companies will have the slightest effect in inducing them to take more care of travellers. They have apparently settled down to the fatalistic conviction that railways are possible only on condition that so many lives shall be sacrificed every year as they used to be to the dragons of old, and that the public must make up its mind to accept this condition. There is only one way of touching the Companies, and that must be left to the juries who will have to deal with the claims for damages. There has just been a long and exhaustive inquiry into the Wigan accident, but a series of costly and troublesome suits will probably have to be undertaken by the sufferers in order to recover compensation. The Railway Companies are armed with all sorts of summary penalties against passengers, and it is only fair that passengers should have similar facilities for prosecuting their claims against the Companies. There is no other method of checking the criminal recklessness and perversity of railway managers. In a less patient and orderly society, one or two of them would perhaps be lynched.

THE WORK OF EDUCATION.

IT is satisfactory to know that the efforts of the Education League to check the progress of education are only in part successful. They avail to confine the attention of Parliament and the newspapers to the question what schools children shall attend; but they have not diverted the time and thoughts of the Education Department from the less exciting, but more important, considerations how children are to be got to attend any school, and what they are to learn when they are there. As usual there is much interesting matter bearing on these points in the Reports of the Inspectors which appear in the annual blue-book. Upon the question how children are to be brought to school these Reports show a remarkable agreement of opinion. All or nearly all the Inspectors concur in saying that, without compulsion of some kind, attendance at school will never become either universal or regular. The children who do not go to school at all, the children who begin to go too late, the children who are taken away too soon, the children who rarely attend for three consecutive days, form in the aggregate a very large part of the population between the years which the Education Act has prescribed as the limits of school age, and not one of these classes can be effectively reached without compulsion. It is sometimes objected that compulsion must at the best be an imperfect agent, and that the true way of getting children to school is to bring their parents to see the value of education. But the value of education can only be judged by results, and without compulsion these results cannot be exhibited on an adequate scale. Popular education, as one of the Inspectors very truly says, "has not had a fair chance with the mass of scholars. No teacher or system in the world could produce any satisfactory effect upon a pupil who came to school at ten or eleven, with his mind blank, and left at thirteen." Yet this is one frequent form of irregular attendance. And even if children come early to school and stay late, much of the advantage may be lost by their frequent absence. "Eight or nine months of good teaching work," says an Inspector, "is often entirely neutralized by two or three months wantonly spent almost in infancy over field-work; or, which is worse and more common, field dawdling."

As might have been expected, there is some difference of opinion among the Inspectors as to whether compulsion should be direct or indirect, and, if direct, by whom it should be exercised. Mr. BOWSTEAD remarks that if every family were industrious and every child brought up to earn its livelihood by honest labour, indirect compulsion might be sufficient. But what, he asks, would indirect compulsion do for that immense number of children in large towns who have no settled occupation, and who, if left without education, are destined to be vagabonds? On the other hand, Mr. KENNEY is so impressed with the difficulties attendant upon direct compulsion, especially as applied to parents of the vagrant, or at all events migratory, class, that he inclines to believe that the most effectual plan for securing a certain amount of education for every child is to make the proved possession of that amount an indispensable condition of every kind of employment. The true way of reconciling these two views may perhaps be to

give effect to them both. In a great number of cases it is probable that compulsion will be found most effective when it is brought to bear on the parent through the employer. But Parliament cannot consistently make the employer do a parent's duty and at the same time allow the parent to neglect his own duty. It is perfectly fair to say to the employer, Every man is bound by law to give his child a certain minimum of education, and you must not, by offering the child wages before he has received this minimum, tempt the parent to forego his duty. Explained in this way, indirect compulsion is entirely reasonable. But if a man is not bound by law to give his child a certain minimum of education, why should the employer be need to make him do, not his duty, but what the law would like to make his duty if it had the courage? At present, it seems, indirect compulsion is in many cases little better than a farce, owing to the want of any proper method of determining a child's age. The Factory Inspector is told that the child is old enough to work full time, but though he may strongly suspect that the statement is false, he has seldom the means of proving it to be so. As the birth of every child is registered, all that is needed to correct this evil is to make a copy of the registrar's certificate the only legal evidence of a child's age. Another evil arises directly out of the half-time system. Parents often argue that, as their children must go to school from eight to eleven as half-timers, it is not worth while sending them earlier. This might be prevented by requiring, as a condition of a child's being employed as a half-timer, a schoolmaster's certificate that he had passed in a prescribed standard. The most careless parent would then be anxious to send his child to school early, because he would know that he could not draw any wages on his account until a certain degree of proficiency had been attained. Further than this, to be really effective, indirect compulsion must be made much more searching than it now is. The life of indirect compulsion is vigilant inspection. So long as they can do it without fear of detection, there will be parents who will send their children to work and employers who will give them work. The only means of checking this is to order the Inspectors to pay unexpected visits to every factory, shop, or field within their district, and to constitute them public prosecutors in every case where the employer is unable to produce an authentic copy of the registrar's certificate of the age of any child whom the Inspector suspects to be too young to be away from school. If it is objected that this would require a very large staff of Inspectors, and would consequently be a very costly process, the answer is that compulsory education, whatever form it takes, must in its early stages be a costly process. The employment of very young children is a most short-sighted economy, but it is an economy for the time being, and it cannot be put an end to without a considerable increase of expence for the time being.

Under the Act of 1870 no School Board need enforce attendance at school unless it wishes to do so, and a Board which does wish to do so is a very proper machine for the purpose. But it is very doubtful whether, when compulsion becomes universal instead of permissive, School Boards will be the right authorities to carry it out. Mr. KENNEY, who has been employed as Inspector of Returns in Gloucestershire, makes some pertinent observations on this head. In agricultural districts, he says, "the desire for exercising compulsion is, as a rule, confined to three persons—the squire, the clergyman, and the schoolmaster. . . . If the other members of each small community were canvassed, they would at once vote against compulsion." In a parish of this type it is quite possible that all the members of the School Board might be obstructives, and a compulsory law worked by men whose interests and prejudices were alike opposed to it would run great risk of becoming a dead letter. If the Board had merely to manage the school, it is probable that the farmers would stay away and leave those really interested in education to do the work; but when one chief function of a School Board would be to remove from farm labour the children who are now extensively employed in it, it is more likely that the farmers would attend for the express purpose of making compulsion as ineffective as possible. The action of the Education League again has made it more difficult than it once would have been to set up School Boards all over the country. Mr. DIXON has so persistently mixed them up with the repeal of the 25th Clause and the suppression of voluntary schools, that many of the clergy who would formerly have been inclined to welcome

them as auxiliaries would now look upon them as rivals. What is wanted is an authority which will enforce attendance at some efficient school, and nothing more. A School Board, even if it were not open to the objection mentioned above, would usually wish to do more. In one of the Reports a case is mentioned in which an active and useful member of a School Board has resigned because the Board has built no schools of its own. To be content with filling other peoples' schools implies an amount of self-denial which is not often found in combination with zeal. Therefore, if compulsion is to become universal, it will be expedient, if not necessary, to devise some new agency for applying it. Probably to do this would not be beyond the capacity of the Education Department; indeed we should not be surprised if some scheme of the kind were even now hidden away in one of Mr. FORSTER'S pigeon-holes.

The testimony of almost all the Inspectors goes to show that, in spite of the Revised Code, intelligent reading is still a rare accomplishment in elementary schools. How important an accomplishment it is needs no argument to show. It is hardly too much to say that if a child leaves school thoroughly able to read, and understand what he reads, he has realized nine-tenths of the total benefits which school life has to give him. The bad reading so generally complained of by the Inspectors is in part due to inefficient teaching. Children learn to read off the words of their lesson with tolerable accuracy, but they are often allowed to do this in an unintelligent monotone which it is impossible to listen to without feeling that the child's mind does not go along with his voice, and that for any pleasure or profit he is deriving from the exercise he might as well be reading a foreign language. The teachers too often regard the reading lessons simply as vehicles of so many hard words, and if the child is able to pronounce these, the school standard is satisfied. Nothing more can be required for a pass at the Inspector's examination, "and the great stimulus of teaching, the money payment, is therefore absent." Really good reading cannot be attained without a clear understanding of what is being read. If, therefore, good reading—reading, that is, in which the meaning of the whole passage, as well as of the individual words, is conveyed to the listener—were required of every child presented in the higher standards, the teacher would be forced to pay more attention to this part of his work. Another cause of bad reading is want of interest in the lesson books. If reading is to be anything more than a mechanical process, the lesson must be calculated to exercise the reader's mind as well as his voice; and for this purpose it is necessary that the books should be amusing in themselves, and should be changed with some degree of frequency. Judiciously treated, what are now known as extra subjects might be made the means of encouraging reading. Or the more exciting chapters of a good story-book, prefaced by a little explanation and linked together by an abridged narrative, might be even more useful. Little will be effected, however, in this direction until the Education Department has a greater control than it now possesses over the books used in elementary schools. There may be objections to a series of authorised lesson-books, but the department ought certainly to have the power of excluding books which are obviously inadequate to the requirements of a good school, and of insisting that books of a certain order of merit shall always be included in the school list.

REVELLING IN HORRORS.

THE *Daily Telegraph* is a paper to which, as we need hardly say, we owe an almost boundless debt of gratitude for the many admirable gems of literature which it scatters with so profuse a hand. A little book has been lately published called *Wit and Wisdom of George Eliot*, containing a collection of the more brilliant sayings dispersed throughout the pages of our great novelist. Whether it is quite fair to treat a living author in this way is perhaps a rather doubtful question. The "beauties" extracted from any great literary artist are cruelly injured by being deprived of their setting. The objection, however, would not apply in the case of a newspaper, where the matrix in which the precious stones are imbedded is necessarily of a temporary character, and when it is consequently to be feared that the valuable fragments are too often left to decay along with the masses of rubbish—of course we only use the word comparatively—in which they are found. A work called the "*Wit and Wisdom of the Daily Telegraph*" might undoubtedly make an admirable compilation. Few remarkable events fail to serve as the pretext for some judi-

cious moral being appended to them in the pages of our contemporary. Here, for example, is an incidental remark, applied, it is true, only to a particular case, but obviously susceptible of being raised into a general principle. The *Telegraph* had been giving with the utmost accuracy an account of the pleasing discovery of various fragments of a human body in different parts of the Thames. When it had got some way into the narrative, it apparently reflected that some of its readers might doubt whether there was sufficient cause for calling attention to such facts by means of a leading article. Any such feeble protests are therefore summarily refuted in the following words:—"These details are all inoffensively sickening; but, in view of the devilish wickedness which has been perpetrated, it would be an act of unjustifiable squeamishness to hush up one circumstance of horror." Having thus relieved its conscience, the *Telegraph* proceeds conscientiously to set before us all the other "circumstances of horror" which may possibly turn the stomach of its readers. There are readers who enjoy that process; the circumstances of horror will afford an appetizing meal for thousands of persons of robust appetite who are as superior to "unjustifiable squeamishness" as the *Daily Telegraph* itself; they will revel in all the "ineffably sickening details" with a delight the less unequivocal because they have it on such high authority that they are somehow or other discharging a duty to society. For our own part, we have about as sufficient relics of the old man to be unwilling to pry into these extremely nasty facts, and we shall dismiss the subject from further consideration with the simple expression of a hope that the person who has committed the crime may be brought to justice, and that his trial and punishment may be got through as quickly and quietly as possible.

Meanwhile, however, we feel it a duty to meditate a little upon the great moral truth which is shadowed forth in the words we have quoted. The *Telegraph* throws off these axioms in so careless and offhand a fashion that perhaps it is scarcely conscious of the full bearing of its own remarks. The facts are unimpeachable; it is an act of devilish wickedness to cut up a woman and throw her into the Thames; though we venture to think that the wickedness consists rather in the preliminary murder than in the subsequent mutilations. However, the ineffably sickening details seem to prove that the murderer belonged to the more brutal type of a brutal class; and we infer from the *Telegraph's* comment that, when a murder has been committed, of which the attendant circumstances are of a kind at which the gorge rises, it would be unjustifiably squeamish to hide a single detail. Of course this remark involves an obvious truism. The details of any crime, sickening or not, must of necessity be published sufficiently to further the ends of justice. The facts should be known widely enough to give every chance of catching the criminal. Nobody will dispute this doctrine, and, unluckily or otherwise, there is no doubt that it will be acted upon. To-morrow morning the placards of every Sunday newspaper will give warning to their readers that a dish of unusually racy flavour has been served up for consumption; and many thousands of people throughout the country will be studying the ineffably sickening details as a pleasant occupation for the day of rest. Long before that time, all the police and everybody who has missed a relation (the number of such persons seems to be considerable), and everybody who loves excitement and is tired of the Tichborne case, will know all the details by heart. So far as justice can be helped by profuse advertising, the thing is done as well as electricity and the printing-machine can do it; and it would be an insult to the penetration of the *Telegraph* to suppose that this single purpose of publicity was all that was in its mind when it uttered the aphorism we are considering. The doctrine is plainly that a crime of unusually sickening character ought to be carefully studied by as many persons as possible. It would be unjustifiable squeamishness to refuse the services of the largest circulation in the world in spreading a knowledge of the most disgusting details to every household in the land. There is, we should imagine, some limitation to this sweeping principle; for there are crimes, equally disgusting if not equally atrocious, upon which it is not considered so desirable to confer this excessive publicity. But hideous murders, it appears, afford a healthy sustenance to the general thirst for knowledge. The *Telegraph* reminds us of the celebrated heroes Greenacre and Good, who thirty or forty years ago afforded a precedent for the present performance; their murders, indeed, were so much in the same style that De Quincey would probably have founded upon the resemblance a distinct charge of plagiarism. That the works of art of such great men should be held up for general admiration, instead of being allowed to perish in the night of oblivion which has hid so many performers of a time anterior to the daily press, is undoubtedly a plausible theorem. And yet we must venture to subject it to a little criticism, pointing out rather the limitations by which it must be bound than its entire fallacy.

That human beings, as at present constituted, and as they are likely to be constituted for some time to come, will take an interest in horrible murders from the point of view which De Quincey has made his own, is an undeniable fact; and we may even admit that such a tendency is not altogether so bad a thing as some purists would perhaps maintain. Philosophers have frequently remarked upon the inconsistency which leads us to take more interest in trifles at our own doors than in tremendous catastrophes at a greater distance. Is it not, such reasoners may

ask, a degrading fact in human nature that ninety-nine men out of a hundred should be far more interested in the details of some crime committed within the metropolitan district than in the convulsions which are upheaving a whole nation a few hours distant by railway? The great mass of Englishmen will be far more curious as to the details of the last murder than as to the progress of that dark tragedy which is being acted before our eyes in Spain; though to the philosopher one is an insignificant trifle, the other a matter in which all lovers of their race should be vitally interested. Upon which it may be observed that, in the first place, it is highly desirable that people should be most deeply interested in what passes at their own doors. As in perspective a cottage close at hand is greater than a distant mountain, so the death of a neighbour looms much larger than the death of millions in China or of thousands in a European war. That the emotion should be stronger is not only natural but desirable; because we can produce a much greater influence in one case than the other. The crisis in Spain may be intrinsically of more importance than the murder in London; but then most of us cannot affect the result of the Spanish war one way or the other, whereas we can produce a certain influence upon English crime and police. But, looking at the matter without reference to ulterior results, and simply as an artistic question, there is still something to be said for the popular interest in murders. Such crimes are generally commonplace as well as hideous enough; but every now and then they have a certain dramatic element in which it would be mere affectation to repudiate all interest. The history of a murder is sometimes a vivid embodiment of human passion and suffering which may affect us as much as a tragedy on the stage. The philosopher may occasionally profess to care only for general results and not for particular illustrations; but, as a matter of fact, people of ordinary imaginative power will be justifiably interested in any event which strikingly illustrates even the bad side of human nature. And therefore, if we would be strictly just, we must admit that there is an element of justifiable sentiment even in the anxiety with which the lower order of readers study the horrors of police reports. That there is in it a great deal which is demoralizing and disgusting is undeniable, as we shall immediately remark; but to say that the vulgar ought to take absolutely no interest in the tragedies of real life is to say that they ought to be one degree more stupid than they actually are.

Where, then, are we to draw the line? Admitting that the columns which a newspaper devotes to shocking murders do not pander exclusively to a barbarizing taste, how can we say where the legitimate interest ends and the illegitimate begins? Much the same question is often asked about novels. What is mere sensationalism, and what is a legitimate element of tragedy? If I, says the novelist, may not deal with bigamy or murder, how do you defend Shakespeare's *Hamlet*, or Richardson's *Clarissa Harlowe*, or Scott's *Bride of Lammermoor*? The general answer is that a great artist deals with strong situations in order that he may give a worthy delineation of powerful passions, and produce a result ennobling on the whole, though particular details may be horrible. He uses the horrible incidentally; whilst you make it the staple of your work. He deals in death and suffering to give a fitting occasion for the expression of his deepest thoughts and loftiest visions; you use them in order to dispense yourself from the necessity of thinking or imagining at all. A great artist may paint martyrdoms and crucifixions for the sake of the elevating emotions which can be stimulated by such scenes; a bad artist paints them to have an excuse for sickening representations of blood and torture. The same distinction is applicable to the case of real crimes. A benevolent and intelligent observer may be interested in the display of human character, even when its manifestations are of a horrible kind. But there is unluckily a much more common tendency to take a morbid delight in sickening details, simply because they are sickening. Psychologists may inquire, if they please, how it comes to pass that objects which turn a healthy stomach are absolutely delightful to a depraved imagination. Whatever the explanation, the fact is undoubted. There is a hideous condition of the human mind in which it takes a kind of sensual pleasure in images of simple horror and cruelty. There are sights and stories which give a kind of shock to a sensitive mind from which it can only recover by slow degrees, but which become actually agreeable in certain conditions of disease. That this should be so is a saddening fact; but nobody can doubt its reality who has observed the way in which a kind of voluptuous cruelty becomes a permanent taste in some brutal natures. That any one who helps to stimulate such emotions is really poisoning the minds of those whose tastes he excites needs no demonstration. Whether an account of a particular murder is or is not liable to this condemnation is of course a question of fact. The story may, in some cases, be told in a harmless fashion, so as to excite rather a becoming sympathy for suffering than a delight in what ought to be repulsive. The most obvious test for discriminating the two cases is given by deciding whether sickening details are brought forward into unnecessary prominence, or given only so far as is absolutely necessary to make the story intelligible. We may ask, for example, whether the recent horror is described so as to pollute the imagination by encouraging readers to gloat over the condition in which different bits of a body turn up at different places, or so as simply to give sufficient indications of the nature of the crime. We shall not endeavour to apply that test to any particular crime; but we merely suggest to the *Telegraph* that, whilst it is applying a sound

principle, announced perhaps in rather too unqualified terms, it should be cautious not to transgress by accident a rule to which we have no doubt it would give its hearty assent.

EDINBURGH.

EDINBURGH occupies a peculiar position among the cities of the United Kingdom. It has no obvious trade, no manufactures, no active commercial life of any kind, and yet it is clearly a growing and flourishing city. A visitor can hardly fail to be struck by the contrast between this apparent absence of anything like business and the signs of general prosperity. Coming from the rush of London or Manchester or Glasgow, the leisureliness of Edinburgh falls upon one at first almost with a shock. The whole place seems steeped in an atmosphere of dozy quiet. Nobody is in a hurry; there is no bustle of traffic. On the open space in front of the Register Office there is at any hour of the day a crowd of men gazing vacantly, with their hands in their pockets. On Saturday afternoons or holidays all the open spaces are similarly filled. The men do not seem to have anything to say to each other; they merely look about blankly, and keep their hands in their pockets. Nowhere is the dignity of labour sustained with less expenditure of physical effort. Even the forenoon in Edinburgh has something of afternoon sleepiness about it. The people who are out walking or driving look as if they were out merely for a constitutional, and as if it did not much matter which way they went. Anybody who suffers from the irritations of a busy town could hardly do better than go to Edinburgh, and be soothed by its elegant repose. It would appear that there is never anything going on there so important that it cannot be broken off for an afternoon at golf or a few days' shooting or fishing. Yet the city evidently thrives on this lazy life. Away from the filth and squalor of the High Street and the closes of the Canongate, which are still disgraceful enough, though not quite so bad as they used to be, you see everywhere signs of ease, comfort, and modest luxury. If there is no palatial West-End, no imposing aristocratic quarter, there is undoubtedly a high standard of middle-class comfort. There is no better test of the ordinary conditions of domestic existence than the style of the houses in which people live, and in Edinburgh people are probably better housed in proportion to their incomes than in almost any other town in the country. This is not because rents are low, for, on the whole, they are higher than in London; but because importance is attached to having a good house, and people are willing to pay for it. In point of fact, very few middle-class people in Edinburgh pay rent; the rule is to own the houses they live in. It will readily be understood that this is an important element in domestic comfort and dignity. A man naturally takes more pride in a house that belongs to him than in one where he is only a temporary lodger, and he is more disposed to improve and beautify it. Old Edinburgh struggled hard to avoid the necessity of descending from the craggy ridge that runs from the Castle to Holyrood, and houses rose in height—there being no margin for breadth—till they threatened to topple over. At last the town spread on either side, and particularly to the north, fronting the Firth of Forth. The present generation would seem, however, to be less hardy than its predecessor; for, shunning exposure to the east wind, it is seeking shelter in the west and south; and the extension of Edinburgh is now chiefly towards Corstorphine and the Pentlands. The new town which in the last few years has sprung up in the south is particularly characteristic of the liberal conditions of middle-class life. It is composed of handsome villas, some in Italian, but most in the Scotch baronial style, standing in their own grounds and embowered in foliage. The rooms are large and lofty, and there are few gardens without a lawn for bowls or croquet. It must not be supposed that these are establishments with any aspirations to social grandeur or kept up by wealthy people. They are all distinctly middle-class households, accustomed to a simple, unostentatious, and, in the true sense of the word, essentially homely, life, and thinking more of comfort than display.

Edinburgh is of course still nominally the capital of Scotland, but during the last half-century it has been gradually abandoning the pretensions of a capital. The memories of the Scottish Court are buried in damp and mouldy Holyrood, and the Scottish aristocracy have long ago abandoned their houses in Edinburgh. In the beginning of the century Edinburgh had still many of the qualities of a capital. It was the seat of government, the central meeting-place of important families from all parts of the country, and the head-quarters of intellectual activity and eminence. Boswell asked Johnson how it was that Scotch lords and lairds all knew each other so well, though their estates were often far distant; and Johnson at once replied that it was because they were in the habit of seeing each other every year in Edinburgh. But nowadays Edinburgh has lost altogether its character as a capital. Scotland is governed from Whitehall, and only parish business is transacted in Edinburgh. The great families have their houses in London, and simply pass a night or two in an hotel in Edinburgh on their way to the moors; and as regards intellectual distinction, almost the last blaze of the expiring flame was seen in the men who were associated with the early days of the *Edinburgh Review* and *Blackwood*. Edinburgh still maintains its reputation as a medical school; but the University, as one

of its ablest Professors has complained, has degenerated into a mechanical teaching machine. From letters both the City and the University are now to a great extent divorced, and the same may be said of the Bar. One by one, with the exception of *Blackwood*, which creditably maintains its literary reputation, the publications which are associated with Edinburgh have either expired or have been removed to London; and advocates have long since deserted the muses and are content to emulate writers and solicitors in their jog-trot devotion to petty technical practice. Scottish art has taken flight southwards. An artist has no sooner made his mark on the walls of the Edinburgh Exhibition than he looks out for a studio at Kensington or St. John's Wood. With its courtly and intellectual glories the social splendour of the Scottish capital has also fled. It is still in its way one of the most agreeable and genial of cities, but society, as it was understood in the days of Jeffrey and Cockburn, has altogether vanished. Lord Murray was the last to preserve even a flavour of its traditions. There is no house left to which men of distinction in various careers would naturally be attracted, even if its doors were open to receive them.

In short, Edinburgh has been gradually sinking from a first to a second-rate city. The magnetic force of London has been too strong for it; but it cannot be said that its material interests have suffered by the change. In proportion as it has ceased to be distinguished it has become prosperous. The two things, indeed, have had a close connexion. Towards the end of the last century there was still a sharp demarcation between England and Scotland, though it was already beginning to be smoothed away; and all that made up the vigour, activity, and keenness of Scottish character was to be found in a concentrated form in what was the genuine capital of the country. It was the lake that gathered all the streams, and there was practically no outlet beyond. The character of the people had then a strongly marked individuality. The language also had a national stamp. Rich, racy, broad Scotch was spoken by all classes; and society was not afraid to adhere to manners and traditions of its own. But within such narrow limits there was not much scope for material advancement. Edinburgh was a poor capital, and life had perforce to be simple and inexpensive. In 1763 a coach went once a month to London, spending a fortnight on the way. Twenty years later there were fifteen stage-coaches on the road, and the journey was then accomplished in three or four days. Edinburgh is now only an eight hours' journey from London; and it is the development of means of communication between the two countries which has robbed the former city of its distinction. The old dam, as it were, has been removed, and there is open way beyond for native capacity and ambition. But, on the other hand, this outlet has also been an inlet. Edinburgh has become a convenient centre for families who have no strong ties elsewhere, and who wish to live in an agreeable and picturesque city, away from the smoke and bustle of trade, within easy reach of the sea-side and the country, and in the midst of cultivated and not too expensive society. Scotchmen who have been making their fortunes in all parts of the world flock back by instinct to Edinburgh. Their own native places are probably too small and narrow for continued residence; and nobody would go near Glasgow except for the sake of making money. There is always a large settlement of retired Anglo-Indians in Edinburgh; and there is also a considerable English colony attracted by the schools and the University, and the economical advantages of the place. Altogether the population consists in a much larger degree than that of any other town in the kingdom of persons of independent means and no occupation. And this is really the reason why Edinburgh is at once so leisurely and so thriving.

It is the peculiarity of Edinburgh that, in losing its imperial position, its aristocratic and intellectual superiority, it has maintained throughout its population an unusually high level of culture and refinement. There is probably a larger body of well-educated, well-to-do, cultivated people there than anywhere else. It is, in fact, essentially a middle-class city; but it is *bourgeois* in a respectable sense. There is a breadth, and freedom, and dignified comfort about the average life of the inhabitants which, in conjunction with professional influences, imparts a high tone to the society. It is the middle classes who supply the place of an aristocracy; the standard of wealth is moderate, and there is less of that miserable and demoralizing rivalry in ostentation and expenditure which is to be found in London and the larger English towns. Professional incomes in Edinburgh are comparatively small. A successful doctor or advocate thinks himself very well off with a couple of thousand a year, and five thousand is an exceptional stroke of fortune to which only a very few can hope to attain. The professors are also limited to a modest competence. The shopkeepers still call themselves merchants, in the French fashion, but there are no merchant princes. All this helps to keep down the scale of expenditure. Rental is rather dearer than in London, and the general cost of food and other necessities is at least as high—that is, taking each item separately. The economy consists in the plainer style of life. A man with two or three thousand a year who would be an utter nobody in London, over-shadowed by great names and vast fortunes, is able to cut a good figure in Edinburgh, without committing any extravagance. The city is not very large, and people walk more than they drive; when they drive, they can

do so in cheap and excellent cabs which are as good as broughams. Dinner parties and other social gatherings are more frequent, but less showy and costly than in London. One of the reasons why houses are better is that people spend the greater part of their lives in their own or neighbours' homes, and society is really homely. Respectable persons seldom go to the theatre, and, except an occasional lecture or concert, there are no other public amusements. Consequently people are obliged to depend on their own resources for relaxation and entertainment. There are private bowling- greens to which the men resort as much for gossip as exercise, while the women have croquet and tea-parties. Hospitality is abundant, but on a simple and unpretending scale; visits are paid without formality, and parties are often improvised. There are a great many idle people in the city; the yoke of professional and commercial pursuits sits lightly on the rest; and there is plenty of leisure both for sport and intellectual studies. Any one who has lived in a little German capital will understand the sort of life which is here passed on a larger scale. Taken altogether, we should say that Edinburgh comes pretty near to fulfilling Bentham's principle of the greatest happiness of the greatest number. It presents at least a very high order of middle-class society.

The inhabitants of Edinburgh are probably most of them Scotch by birth, but they are by no means conspicuously Scotch in manners, speech, or other external characteristics. Glasgow is much more intensely national, and, we may add, parochial. It is from the Western city that the protests against the use of Englishman for Great Britain, and against other insults to the thistle have usually proceeded. In this respect Edinburgh has vindicated its imperial character by its greater breadth of view. It is cosmopolitan in its interests and sympathies. The local newspapers, for example, will be found to be full of general news sent down from London. They contain comparatively little about Scotland, and scarcely anything about Edinburgh, though, to be sure, it is not perhaps very often that anything happens there. Although Edinburgh is still nominally the capital of Scotland, it has lost its distinctive nationality, as well as its old-fashioned local character, and may almost be numbered among English cities. Nothing gives individuality to a place so much as a common commercial interest. It is wonderful how people hang together when they all depend on iron or cotton, or some other staple industry. But Edinburgh is destitute of interests of this kind. It has no great works in which all classes are concerned; and in fact it is not engaged in collective work or action of any kind. The only bond between the inhabitants is that they happen to live in the same town, and are anxious to lead a quiet and comfortable life; and this is probably the cause of its political weakness. The direction of local affairs has fallen into the hands of vulgar agitators. The gilded lamp-post at the baillie's door is shunned, rather than coveted, by all who value their self-respect; and the Provostship has lately more than once gone a-begging. Macaulay, we fear, would have little pride in the political condition of the city he once represented. On the whole, it would perhaps not be unfair to describe Edinburgh as the paradise of humdrum ease and intelligent gentility.

SCHOOLBOYS' POCKET-MONEY.

THE early days of the Recess present the weary Education question to the mind of the average middle-class and middle-aged householder in a very distinct form. During the Session he has been more or less interested in the problem of the education of other people's children, and has maintained either the superiority of voluntary effort, or the principle of an education which shall be rate-supported, compulsory, and free. He has grumbled about the pressure of rates more for the sake of grumbling than from any personal consciousness of this pressure, unless he chance to be a landowner, a country rector, or a professional man in an inland town which has just resolved upon a system of drainage and water supply. But with the Recess comes a view of the educational difficulty which gives him something worth grumbling about. He has to face the practical question of providing for the education of his own children. They have all come home for the holidays; and after a few days of grace charitably allowed for the enjoyment of the family reunion, they are followed home by the school bills. No resource is to be looked for here either in denominational energies or in public rates; and the supporters alike of the Birmingham League and of the National Society find themselves bound to an educational system which is socially "compulsory" certainly, but very far from "free." Nor is there much consolation to be derived from the vague hope that "things may take a turn." The tendency of the day is to increase expenditure everywhere; and in the rivalry between one wealthy class with a position to make and another with a position to keep up, it is scarcely to be wondered at if prices in the educational market, as in the markets for more tangible commodities, show signs of a steady rise. And the summer school bills bring with them a burden peculiarly their own. At Christmas bills of all sorts are in season, like coal fires. The back is prepared for the load, and as few men have cared to calculate the amount of their domestic liabilities, an extra fifty or hundred pounds is all in the day's work. At Easter there is nothing particular to spend, and the school bills are possibly lightened by a tradition of the old times of "half-years," which postpones the bill for the spring term, to fall with heavier

weight in August, when Midsummer payments have exhausted the domestic exchequer, and there is the seaside or the Continent to provide for, which means inexorable ready money and no "tick." The screw is turned so severely at these times that it is no wonder if the victim cries out, or if he vents his indignation on the first thing or person which occurs to him in connexion with the terminal account, and is somewhat savage about the claim for "subscriptions." He pays the bill; and when the holidays are ended, and November has brought the football season well in, he will boil over with righteous wrath because a School Twenty "cap" has not been conferred on his boy, who "was worth half-a-dozen of the fellow that has got it instead."

As the holidays draw towards their close, a minor, and yet in its way a serious, difficulty presents itself for solution. Over and above the school bills and travelling expenses the educational estimates must include a certain percentage in the shape of pocket-money, and the fitting amount of this tax has recently come to the front as matter of common interest. The Head-Master of Haileybury, Mr. Bradby, issued in the course of last term a circular addressed to the parents of the boys, in which he gave his own opinion in the straightforward and sensible way which marks everything that he says or writes; and this circular has become in a measure public through the criticism of some of our contemporaries. His view, translated into the vernacular, appears to be that "it does fellows no good to bring so much tin with them; it mostly goes in grub, and fellows have an awful lot too much grub already sent them in hampers from home." The hamper question is beyond the limits of the present article; but Mr. Bradby's suggestion about pocket-money comes to much the same thing as the old Homeric maxim, very happily quoted some years ago by a writer in *Punch*:—

Οὐκ ἀγαθὸν πολυκοιρανίᾳ· τίς κοίρανός ἐστιν;

He too recommends the "one sovereign" as more desirable than "the many," but not taking note of fractions, he would admit a liberal margin up to some thirty shillings. If it were possible to lay down a strict rule on this subject, and to find means of enforcing it, a real and pinching hardship might be removed from the present experience of many schoolboys, and might be put out of the account in the calculations of parents with narrow means. It is confessedly a trying thing for a boy to bring, and to be known to bring, much less money in his purse than other boys in his house or form. It may subject him to an ordeal of chaff, which is hard to bear; or of compassion, which is harder. His father probably, therefore, strikes a balance between his own judgment and the public opinion of the boys; unless he is weak enough to sacrifice his own judgment altogether. After all, however, the hardship of measuring a scantily supplied purse against many full ones is only postponed in the boy's experience of life, and not taken out of it. He will have to face the contrast at college, in the services, in commercial life, or in any possible position of the future; and if the public school be, as Canning and his contemporaries described it, a microcosm, it is just as well that some of the roughnesses of the greater world should be allowed in the training of the smaller. That it is an unquestionably bad thing to allow a lad a large command of money no one would deny, except here and there a weak or vulgar parent of the type described by Miss Edgeworth in her "Eton Montem"—"And this I will say, that my boy, he spends more money, and has more to spend, than my Lord John, though my Lord John is the son of a Marchioness." Of course a higher culture ought long ago to have led to the extinction of this parental type; and that it can survive in the Eton of the present day is a position which we should hesitate much to assert, though possibly still more to deny. But it is doubtful whether a hard and fast line would be desirable, even were it possible to draw one. Although the parental allowance might be a constant quantity, the financial balance would be liable to perpetual variation by means of "tips"; and no possible law could reduce to any uniform operation the number, the liberality, or the accessibility of grandfathers and godmothers, of uncles and old family friends. Some approximate equality might indeed be reached if the boys of the same school were mainly supplied by families in the same position, or with the same fortune. This experiment has, we believe, been tried; and we have some impression that Haileybury itself is a case in point, in which the public school system was intended to be placed within the reach of parents to whom Eton, Harrow, and Rugby were not accessible because of the cost. But, unless our information is incorrect, we doubt whether the experiment has worked as was proposed. It is said that many parents of larger fortune and higher social position have availed themselves of the lower terms offered by such schools as we describe, and that the result has been a mixture of classes in the new schools similar to that which prevails in the old ones; a result which we hold to be an absolute benefit, both to the schools themselves and to all the boys in them. A school exclusively consisting, say, of the sons of clergymen, or of solicitors, or of Civil Servants, might do very useful work, but would be distinctly wanting in the microcosmic character which makes a good public school so excellent a training ground for the work of life. Against one form of weakness and shabbiness combined, however, a word of caution may be allowable. At several of the newer schools the cost of education is lessened in some cases by a system of nominations. Where these have been almost importunately begged for by parents on the ground of the narrowness of their resources,

there is a certain want of integrity in the weakness which indulges a boy with excessive allowances of pocket-money in order that he may have the same opportunities of spending as his richer schoolfellows. It will often be found, if any one will take the trouble to make the experiment, that a condition of public opinion which has been taken for granted in a school does not really exist. About twenty-five years ago a few of the bolder spirits among Oxford undergraduates ventured to break through the traditions of wine-party desserts supplied by the confectioners, and bought their fruit and bisuits at "Coopers" for about one-fourth of the traditional cost. They nerved themselves to face the censure of "the college," but "the college" simply followed them nearly to a man. It chanced not long since that a man of this "college," finding that his son was provided with a first-class ticket in coming home from a preparatory school of great repute, where such tickets were supposed to be *de rigueur*, suggested in the proper quarter that he was himself in the habit of travelling second. The choice was at once given in the school, and a first-class ticket became speedily the exception to the rule. Just so in matters which must exclusively be left to the boys. If the parents of one or two influential lads, high in their houses and the school, and known also at the wicket and in the "scrummage," will persuade them to make it understood that excessive "grub" is something babyish, and that it is only cake who will chaff a fellow who has not much tin, the same sort of result is tolerably sure to follow. There are some matters in which the head boy of a house ought not to be left to his own resources, but should be overruled by strict authority exercised by the head-master. Within certain bounds, for instance, the week's "allowances" may fairly be stopped for the credit of a house; as for an athletic or other prize. But if the "sporting interest" takes it into its head to represent that a Derby lottery is a case for compulsory stoppage of the allowances, and is strong enough to carry the schoolboy majority with it, the masters are bound to interfere, and to insist that an interest in the fortunes of Doncaster or Gang Forward shall be left to each boy's individual choice.

For the information of such of our readers as may not be familiar with the details of schoolboy finance, we may state that pocket-money, like the "omnia Gallia" of Cæsar, "dividitur in tres partes." There is the weekly allowance, advanced by the school and charged in the bill, which may be put at a shilling a week, and is sometimes sixpence. This is chargeable with school fines, and is available for house or other "stoppages." Next come the "subscriptions" by which the games are maintained, and as to which the rule of "no compulsion, only you must," very properly holds good. The amount of these is fixed in some cases by the school authority, when they are of moderate amount, and in others by a mysterious power known as "Big-side," which is understood to be a constitutional government of some kind, but with a tendency to an extravagantly high scale of taxation. Last comes the pocket-money proper, the spending of which is at each boy's discretion, tempered by rules relating to bounds and to prohibited articles such as alcoholic liquids and vegetable matter made up in the form of cigars. Unless a boy has any special taste or pursuit, it may be taken for granted that the whole, or nearly the whole, of this disposable balance will be spent in "grub." But it would not be fair to assume that this general term means simply "toffy," "tom-trot," "bull's-eyes," and such other unwholesome luxuries as found favour with junior Etonians in Mr. Coningsby's time. We believe that, apart from the higher aesthetics of strawberry ice and thin biscuits where and when such things are attainable, what is known as "grub" is to a large extent only the raw material on which the cooking instinct of the average schoolboy is exercised. Mr. Bradby remarks, no doubt very truly, that plenty of good and wholesome food is provided for all the Haileybury boys. This is exactly the state of things under which, by way of varying the monotony, the boys are likely to provide themselves with food which may not be unwholesome, but which is certainly, on all gastronomic principles, bad. Bread, potatoes, eggs, butter, sugar, and all manner of common and wholesome articles of food are elsewhere—and very possibly at Haileybury also—purchased for the purpose of being converted into various unheard of compounds, to be boiled or fried over the gas in inkstands or biscuit-tins, if the orthodox fire and saucepan happens to be previously engaged. We have heard of a hideous combination of sloes and brown sugar, the thought of which sets any ordinary tooth on edge, as constituting one of the luxuries of the school October term. This sounds of course all very absurd and childish, but the boys do in this queer way pick up a good many ideas of rough cookery which will stand them in good stead when they come to after-experience of life across the seas, where many of them must go in time in the search after a livelihood. Mr. Bradby has done good service to his boys in his plain warnings to their parents against foolish and weak indulgence; and all parents may do well to take the advice, and apply it as they are sending their boys back to school. If a man knows that his sons must make their own way in the world, he ought honestly to tell them so, and put them in the way of preparing for it. The boys who now fill the forms of our public schools are not "little ones" who "knuckle down at law" as in Cowper's days, or who bowl hoops as in Gray's time at Eton. These are to be found in the preparatory schools which are the existing substitutes for the "lower forms" of other days, but in which, as we need scarcely add, the marbles and the hoops of the last century are alike unknown. The public schoolboy has "come to age"; the microcosm in which he lives is, as a rule,

wisely and strongly governed; but if his father has not the courage or the good sense to show him how to bear his part in the little world, he will fail grievously of its advantages as a place of training for the great one.

VICHY.

WHATEVER gleams of Imperial sunshine may have brightened the most frequented of French hot-springs, Vichy is in the natural order of things a true "città dolente," where victims of gout, dyspepsia, and kindred diseases make ineffectual efforts to be cheerful. The Casino is as smart, the band as indefatigable, as those of its German rivals; yet the entertainments provided miss fire more palpably at Vichy than elsewhere. It is so much the better for weary souls who have borne the yoke of incessant and clamorous amusement, even if ill-health has not brought them there. There is to them a novel interest in observing the unfamiliar aspects of human life when the social glaze is taken off it, and when the layman is admitted to some of those secrets which physicians keep so well. When the high pressure of "the common round, the daily task" is abated, we see something of what is underneath the grin and giggle which is assumed for even the most family gathering in the family country house. The natural man is not altogether repulsive in his weakness. He reveals traits of the old-fashioned individuality which existed before omniscience and omnipresence had demoralized us. There is still a sufficiently lively dance of death, and its satire may be studied with advantage, while its exposure of pretences is quite an agreeable antidote to the narcotics of civilization.

At Vichy, where specimens of mankind from either hemisphere congregate, internationalism has no existence. Indigestion checks the enthusiasm of humanity. Sufferers from enlarged liver care little for the coming race, and all possible evolutions of society leave the votary of the Source des Célestins apathetic. Besides the facilities offered for unusually accurate study of its visitors, Vichy also gives the travelling Englishman a chance of appreciating the frankness and originality of French provincials. The country merchant shepherding his valiant helmsman, their daughter with conventional face, the middle-class cotteries joined in the bonds of similar ailments, are studies not to be found elsewhere by strangers. As the groups established round the Kiosk to hear their favourite opera airs and vases gesticulate, perorate, make feeble and fitful love, or patiently endure the monkey tricks of their spoiled children, we cannot but recall Molière's comedy of life. He described the same people with but little anachronism, for there is a deep-seated conservatism of manner and habit among the French which has somehow withstood the Code and the sophisms of '89.

Of twenty-five thousand yearly visitors to Vichy only about three thousand are foreigners. Discontented tradesmen complain of bad seasons since the eclipse of the Bonapartes. They also hint that this year the devotional pilgrimages have hindered the worship of Health. The spare enthusiasm of believing souls was claimed elsewhere, and the pious care of the body no longer took precedence of other religious observances. At all times it would appear that the ritual, the priests, and the shrines of the great goddess Digestion lose importance during national calamities; but with returning prosperity Vichy must always thrive, as its past history declares. Without inquiring what use Vercingetorix and the Arverni made of their property in its springs, we know that the Romans appreciated them. Gouty grandees from Lugdunum sought relief at the station of Aquæ Calidæ, and waning beauty was supposed to be restored by their virtue. Five types of Venus Anadyomene have been found in excavating the Roman ruins. Restored youth and remoulded form are seldom achieved by the modern drinkers, who at no stage of their treatment suggest grace or beauty. Venus is the last person that the observer is likely to meet by the sources of the Grande Grille or the Célestins. Our complicated modern life seems more and more to interfere with ideal perfection of form, and to require all the inventions of medical science for its well-being as fast as they are found; for the civilized Dives, if not fuller of sores than the mediæval Lazarus, is more impatient of them. From the fourth century, when the Roman baths were abandoned, to the sixteenth, people did without Vichy water and its salts. Even when, in the twelfth century, the position of the place gave it some importance, its bicarbonate of soda was only appreciated by the neighbouring cattle, who flocked inconveniently to the springs. Some ruined walls and a tower still exist of a castle attributed to the third Duke of Bourbon, who made much of his châtellenie of Vichy "because of the pureness of its air." On the frontier of Auvergne and the Bourbonnais, and commanding for some distance the passage of the Allier river, tolls were levied then which presently attracted the greed of the kings of France. The civil war of the Bien Public was terminated at Ousset, a town hard by, and Charles VII. took the opportunity of its resistance to leave a garrison at Vichy. The place has an interesting story, whether sharing in the eleventh century the fortunes of the Sires de Bourbon Archaubault, or the greater splendour of the ducal race founded by Robert de Clermont, a son of St. Louis, and terminating with the Constable who died at the gate of Rome. Yet in the ebb and flow of its prosperity during the Fraguerie, the Bien Public, and the Huguenot wars, the medical value of the hot springs was neglected. What use was made of them was by the Célestine fathers, who had a well-

endowed house at Vichy, and doubtless had preserved some Roman traditions of gout and dyspepsia.

With peace and Henry IV. the science of life revived. Readers of Montaigne thought the welfare of the body as important as that of the soul. The cattle were shut out from their favourite spring by a *grande grille*, which gives its name now to those waters dear to sufferers from liver disease. A little house was built for strangers, with accommodation for two bathers, and called the Maison du Roi, while a knot of lodgings supplied footpans, glassos, and lesser aids to hydropathy. The Capuchins established themselves near the Grande Grille, and they and the Célestins were hospitable. In the middle of the seventeenth century medical fashion set towards Vichy in a current which has been more or less constant ever since. La Bruyère tells us how Madame de Montespan went to Bourbon to be cured of vapours, but the true chronicler of life at "the waters" in 1676 is Madame de Sévigné. Our readers can find in her letters a great deal about the company and life at Vichy which still holds true. Fewer *bourrées* are danced in these days, and the labourers are hardly such perfect *bergers de l'Astrée*. There is more railway flotsam, but the talk remains probably much the same, and is racy of the waters and their effects. The number of glasses swallowed is not so startling as in the days of the *Malade imaginaire*, but in the main there is singularly little difference between 1676 and 1873. The country traders who come to Vichy from all parts of France have more visible originality than our gorgeous middle class; and to a rank below them the local costumes give a dignity of their own which with us is lost in the vulgarity of flimsy finery. Vichy has been loaded with improvements by each Paris dynasty, but the tenacious good sense of the country folk, Auvergnat in their traditions, is satisfactory in its hold of old customs. It is but necessary to pass from the wide straight boulevards to the old quarter of the Château Franc, or to stroll a mile into the country, to perceive that enough of the old ways remains to reprove the style, beloved by speculators, of the Second Empire. Mesdames Adelaide and Victoria of France began the modern Vichy by enclosing in the existing gallery four of the chief springs. By an edict dated from a Russian village, Napoleon ordered the park to be laid out, while the Duchess of Angoulême did not disdain to conclude his work. No power short of a Company could, however, have made Vichy what it is. The Company farms the springs, provides a casino, and all that goes with a casino—plays, balls, newspapers, concerts, and whatever the modern man desires, short of roulette and trente-et-quarante. Its various workshops are open to the public. Nothing can be prettier than the steam works; and after seeing the preparation of the sweetstuffs containing Vichy salts, the visitor is irresistibly disposed to consume henceforth his daily dozen of medicated lozenges. Let us hope that the world's digestion is benefiting by the two million and a half quarts of Vichy waters yearly bottled and sent to the four quarters of the globe. The creative power of Companies, backed by an inviolable Emperor, is great, we trust that no new form of disease will appear as a consequence of the large consumption of Grande Grille salts. In twenty years the visitors to Vichy have quadrupled, and the consumption of its exported waters has multiplied sixfold.

Fairly good plays, and an almost perpetual flow of music, are the chief aids in promoting the "joye fort nécessaire pour faire profiter les remèdes," according to the *Mercurie galant* of May 1678. It is doubtful whether Offenbach's breakdowns and lively waltzes at eight o'clock in the morning are calculated to cheer dyspeptic wretches. Their lugubrious faces as they defile before the Grande Grille do not express satisfaction as the distant tum-tumming bids them be merry. To the weary and heavy-laden bound for the Célestins, ornamental fountains and plaster statuary appear superfluous joys. Yet who knows but that some believer in progress may be comforted by the scarlet geraniums bedded out with true "international" taste, the oleanders in green boxes, the booths, and the continual gurgle of the orchestra? Let us live and let live, if we can, at Vichy, where the effort is not always easy. Seventy-one hotels and uncounted lodging-houses supply the necessities, if not the luxuries, of life. The hours at all of them are regulated to suit the bathers. Seventy-one bells announce a breakfast of five courses at ten o'clock, and much the same meal is repeated at half-past five. The Allier and its many tributaries supply piles of gudgeon, which, fried in the same way, are not very inferior to overgrown whitebait. The waters give appetite, and it is curious to see how much the sorriest invalids eat, though the régime of abstinence between the meals has much to do with their hunger. When once it is appeased, the storm of talk that breaks along the *table-d'hôte* is more polyglot than at first seems likely from the uniformity of dress. The Mediterranean sends a melody; Algeria being of course represented, though the officers and soldiers sent home officially for cure are for the most part accommodated in the special military hospital, where there are quarters for nearly two hundred men of all ranks who require Vichy treatment. In the civil hospital 236 invalids are taken in on the certificate of their local authorities. There is abundant water for all comers. About three thousand baths daily are available, and from the Grande Grille source alone over twelve thousand gallons in twenty-four hours burst up at a temperature of 106° Fahr. Before it the frequently returning drinkers pass in strings, sometimes numbering thirty thousand in the day, so that at the favourite hours the four women who ladle out the water cannot fill the graduated glasses fast enough. Of the procession there are few who do not look really ill, for the diseases treated, whether at the Célestins or at the Grande Grille, mark their victims very plainly. The misery

of people's faces tells its tale of woes below the ribs. And in themselves the waters are depressing, even when most curative, and often fatally treacherous when ignorantly used.

Of course there are sporadic attempts at fine dress among ladies who are only in attendance on their suffering lords and not particularly ill themselves, but the moist atmosphere sadly damps their efforts at whitening the sepulchre which cannot be effectually screened from lookers-on. No sculptor in search of models would go to Vichy. On festival days, however, good-looking and healthy peasants mingle with the visitors. The Auvergnat caps and bonnets contrast with Parisian headgear in the long alleys of the park, while under them are comely faces curiously observing the bedizened invalids. It is pleasant to leave the sick folk of the new town, and get out into the wooded and fertile country whence the peasants come. Within a mile of the Imperial boulevards old France still exists. Large farms, if dirty and untidy, bear witness to wealth by their extensive stoadings. Well-fed dun cattle do most of the work. The sheep are not unsightly, and the soil seems equal to most crops, from hemp and beet to vines on the gravelly hills. Abundant poultry and pigs, frequent orchards, and fully-cropped gardens attest the custom which secures to the labourers and their families employment on the same farms for generations. The child who herds the geese, and the ancient dame who twirls her distaff while she looks after the *pot au feu*—each contribute to the general store of wealth small gains which are lost in more "advanced" systems. Probably few of the English visitors try to understand the value of usages which help the French peasants to withstand the destructive forces of the Code. The unkempt foregrounds shock our taste, even though they are backed by the broad lines of clear-cut horizon to the North, and by the volcanic peaks of the Puy de Dôme to the South. A D'Aubigné or a Corot would find satisfaction in the green greys of the well-watered fields where the English eye might desire more "colour." The British tourist must have tidiness, and neither the castellated manor of the lord nor the disorderly hamlet of the peasants is likely to satisfy his taste. Yet, as there are few facilities for inordinate reading at Vichy, no opiates of the understanding in the way of good lending-libraries, very questionable company in the Casino, and a great deal too much music, the visitor to Vichy may utilize the exercise recommended by his physician in gaining some true idea of the landed interests in his neighbourhood. He might in future weigh more justly the claims of parties and the mischief done by agitators who falsely claim to speak in the name of the "people." An improved political instinct might be gained during his month of baths, not less than an improved digestion equal to the trials of an English winter, with its mince-pies and leading articles.

THE DAILY TELEGRAPH'S HISTORICAL PARALLEL.

MANY, many years ago we remember that a political opponent of Sir Robert Peel, speaking of one of those changes of policy with which he surprised both his friends and his enemies, called it the fifth, sixth, or seventh—we cannot be particular as to the numeral—"avatar of Buddha-Peel." We are too dull to see much likeness between Buddha and Peel, beyond the fact that each has had a following called after his name; and certainly the sect of the Peelites has not been so lasting, nor has it spread itself over so large a portion of the earth's surface, as the sect of the Buddhists. But when the process of metempsychosis is fairly set to work, the question "Who's who?" becomes one which it does not at all do to answer lightly. Pythagoras, so the more moderate legend went, had once been the Euphorbos of the Iliad; but, according to some of his admirers, he had been several things of a much more unlikely kind, a fish and a bramble-bush being among them, if we rightly remember. The vivacity of the fish which thus came to light again in the shape of the Samian philosopher might make us think that he was some kin to the "fish unable to drown" who once appeared in the proof-sheet of a writer whose manuscript contained the words "fashionable bedroom." But in those distant regions inhabited by fish, brambles, legendary—perhaps solar—heroes, and gods of Eastern mythologies a good deal may be safely ventured. It is more dangerous walking among the recorded worthies of European history of any date. The great houses of Rome were at no time to be lightly huddled; even misapplied reverence sometimes brought down summary vengeance; the ivory staff of Marcus Papirius came down heavily on the head of the Gaul who stroked his beard as that of a God. The Cornelian clan, in its many branches, turned out not a few men with whom one would be decidedly shy of taking liberties. We do not at all know how the Cossi, the Lentuli, the Scipiones, and the Sullæ might relish having men of our own times so closely identified with them as to make it almost seem that the later personage is an avatar of the earlier. At all events, if such speculations are to be indulged in, it would be well to hit upon ancient and modern personages between whom there is some kind of likeness in character or actions. By help of a little stretch of imagination we could conceive the elder Cato, the renowned Censor, appearing again in the person of Mr. Ayrton, or even in that of Mr. Lowe. To be sure between Cato and Mr. Lowe there is one marked point of difference. Cato, much as he hated the Greeks, was so convinced of the advantages of Greek learning that he set to work to master the language in his old age. Mr. Lowe has so fully made up his mind the other way, that he seems sorry that he learned Greek in his youth. Still, the universal biter, the *wastastyræ*, is not with-

out points of likeness to either of his suggested modern antitypes; and both Cato and Mr. Lowe have been made the subject of epigrams in divers tongues—from the earlier one of which we have just borrowed an epithet—describing beforehand what was to happen to their subjects in the other world. If Mr. Lowe then should wish to be identified with any Roman worthy, or to ask for adoption into any Roman family, we should suggest the *Gens Porcia*—the gens of him whom Persephone declined to receive into Hades—as the one in which he would find himself most at home. Porcius of Tusculum too was after all a plebeian, and to trifle with his name and ancestry might be a less matter than to lay hands on the doubtless Trojan blood of the Corneli. And, setting superstitious reverence of this kind aside, we are wholly at a loss to see any point of likeness between the new Home Secretary and Publius Cornelius Scipio Africanus. But the *Daily Telegraph* thinks otherwise. If we may venture to face the young lions, we should say that the likeness between the two worthies had been purchased at the cost of a little tampering with the recorded actions of both. Mr. Lowe's successes have at all events not been military. We know that he sometimes indulges in a romantic vein, as when he seeks to describe the studies, or to fix the date of the foundation, of the University or the College which he so deeply regrets ever having belonged to. But Mr. Lowe himself would hardly, even at a dinner of enthusiastic civil engineers or of patriotic Millenarians, have ventured to see a parallel between himself and "the great commander who had crushed the power of Rome's enemies and given security and prosperity to the city." To say nothing of the widely-different fields in which the achievements of Scipio and those of Mr. Lowe have been wrought, the parallel can only be made good by altogether turning about the state of political parties with which Scipio and Mr. Lowe have had to deal. Mr. Lowe is a member of a Liberal Government; he has to defend himself and his colleagues against Conservative accusations. Scipio, on the other hand, was a high aristocrat who had charges brought against him by the Tribunes of the Comitia. In most hands this would be felt to be no small difficulty in making out a parallel between two men in such opposite positions. But Jupiter junior has clearly inherited the power by which the elder potentate could bestow what form he pleased either on himself or on any other person, divine or human. A knot that cannot be untied must be cut. If the facts do not fit in with the rhetoric, so much the worse for the facts. Therefore, while in the older form of the story Scipio is attacked by Tribunes set on by Cato, in the version of the *Daily Telegraph* he is attacked by "the bitter Roman Tories who hated Scipio's reputation more than they loved their country."

Perhaps, however, to attend to distinctions of this kind is after all mere pedantry. Tribunes and Tories have at least as much in common as Macedon and Monmouth; each name beyond all doubt begins with a T. In either case, in the words of a poet quoted by Lord Macaulay,

Noble Publius worried was with rogues.

If then it is desired to look learned and to point a period, it is perhaps hard to expect the rhetorician to trouble himself as to the exact nature of the rogues or the exact colour of their political opinions. And again there is something to be said on the ground of *ἀντιστοιχία* or tit for tat. How many bitter Roman Tories have been taken for Liberals; how many fierce aristocrats have been turned about into zealots for democratic rights. How often has either Brutus—of course we do not count the founder of Totnes—been taken for a French Jacobin. And did not a body of grave American patriots pledged to the doctrine that all men are born free and equal found, first a society and then a city, called after that Lucius Quinctius Cincinnatus who, if he ever existed at all, must have been as bitter a Tory, or oligarch, or whatever we please to call him, as can be easily lighted on in a day's search among the records of any age? When so much of this kind of thing has been abroad in the world, it is only fair now and then to turn the tables, and, as the aristocrats have been so often painted as demagogues, for once in a way to paint the demagogues as aristocrats. Let then the rogues who worried noble Publius be, for the sake of argument, allowed to be bitter Tories, as well as the rogues who have worried that later worthy whom the *Daily Telegraph*, if it had been in a tender instead of a learned mood, might have spoken of as noble Robert. But we must think that the *Telegraph* is hard upon the later of its two heroes. If we still have the true Cornelian line among us, if noble Robert is in truth only an avatar of noble Publius, it is clear that in some intermediate transformation he must have greatly improved some parts of his character. If Mr. Lowe would not be likely to rival Scipio on another Zama, he has certainly not, in his present form, done anything like those particular deeds by which Scipio drew on himself the wrath of his enemies, Tory or other. "In simpler fashion," we are told, "and on a less prominent scene, Mr. Lowe has just renewed the example of the conqueror of Carthage." We are happy for Mr. Lowe's sake to say that he has done nothing of the kind. "It was," the *Telegraph* says, "intellect justifying itself by history which was heard at Sheffield." It was hardly intellect in any form which was seen, heard, and felt at Rome. On the whole, if we had to compare Scipio at this particular stage of his life with anybody within the last few years, it would not be to Mr. Lowe that we should liken him, but to certain of the Fonians. "The bitter Tories," according to the *Telegraph*, "accused Scipio of all sorts of petty offences and misdemeanours." It goes on to tell us how "he made his appearance before the Assembly, but to the surprise and

disgrace of his calumniators, instead of an apology the illustrious citizen pronounced a clear and complacent vindication of his services." We suppose then that, in the political morality of the *Daily Telegraph*, it is rather a fine thing for a man who is regularly accused before a legal tribunal, instead of pleading any way or another, to tell the Court how great his services have been in past times. Our stern forefathers would have sent such a one to the *peine forte et dure*; the milder law of Rome allowed any accused person to escape judgment by going into exile at any moment before his formal condemnation. Surely if (*quod absit*) Mr. Lowe should ever be put on his trial for any charge—let us, in the case of such a defendant, conceive the archaic process revived which was famous in the days of Strafford and Warren Hastings—would the *Daily Telegraph* approve, if all the notice that Mr. Lowe took of the charge was to tell his judges, in a clear and complacent fashion, that he had opposed Parliamentary reform and tried to lay a tax on lucifer-matches? To be sure Scipio had somewhat greater exploits than these to hold forth about, but the principle is the same—the principle that a man's former services may be pleaded in answer to a legal and definite charge brought against him. No charge has been brought against Mr. Lowe; he has not been arraigned before any court; and the *Daily Telegraph* seems to feel this in a kind of lazy way when it speaks of Mr. Lowe acting on a less prominent scene than Scipio. Altogether the likeness between the two scenes of action, between a trial before the highest legal court and a speech made at a Outlets' dinner, strikes us as coming as near to the nature of unlikeness as any likeness can do.

But after all what had Scipio done? He had been guilty of a succession of lawless acts. His brother Lucius had been called upon to bring forward the accounts of the campaign in Asia, in which Publius was concerned as well as himself. The story is told with a good deal of difference of detail; but there seems to be no doubt that, when the accounts were brought forth, some say by himself, some say by his brother, Publius tore the writings in pieces in sight of the people. When his brother was sent to prison, Publius further by force and arms rescued him from the custody of the legal officer. When put on his own trial, the only answer he made was, that it was the anniversary of his victory over Hannibal. All this, it would seem, is looked on by the *Daily Telegraph* as an instance of intellect vindicating itself by history. We should have thought that it was rather an appeal to club-law, more in the style, as we have already hinted, of Clerkenwell Fenians than of any member of any English Government for a long time back. Surely a wrong is done to Mr. Lowe in this matter. No one has ever charged him with being other than a decent and law-abiding citizen in his own person; the bitterest Tory or Tribune has not suspected him of tearing up the public accounts, still less of assaulting constables in the discharge of their duty. Yet these are the great feats of intellect of which, according to the *Daily Telegraph*, Mr. Lowe has renewed the example. Altogether it is the old story of saving me from my friends. It is not in the character of bitter Tories hating his reputation, but in that of impartial lookers-on wishing to do justice to every man, that we protest against Mr. Lowe being looked on as an avatar of Publius Cornelius Scipio.

CAPITAL PUNISHMENT AT HOME AND ABROAD.

THE resignation of Señor Salmeron on the question of capital punishment ought to gain him immortal honour from the Friends of Humanity all the world over. Nothing could be more gratifying than this self-sacrificing assertion of their sentimental principles by so prominent a politician, unless, indeed, he had succeeded in asserting them successfully. But it would seem that even in the Radical Cortes of Spain, as in the Assemblies of Italy and France, there is a majority that objects to proclaiming an amnesty in advance for all the murderers in a country where murders are of everyday occurrence. Indeed legislators who have not regularly graduated in the sentimental school which turns out theorists like Señor Salmeron may be excused if they find it difficult to follow him in his fine-drawn distinctions. He has been sufficiently thoroughgoing in his administration of the Government, considering his antecedents and his earlier political connexions. Many of the more enthusiastically practical Federalists, who went a little further than the theories which he was in the habit of promulgating, have been shot down in battles or bombardments by troops acting under his authority. As Chief of the State he approved those praiseworthy military executions following on drum-head courts-martial by which General Pavia restored order in the army which Salmeron would at one time have had disbanded. Yet he shrinks from taking the life of the most infamous criminal who has been deliberately judged and calmly condemned by the ordinary civil tribunals. It is curious that the Legislatures and the courts of justice should be extraordinarily tender of life in the countries where the people hold it in the lightest estimation. The same morbid feeling paralyses the administration of justice in all those Southern countries where blood is hot and deeds of violence are frequent. In Italy, as in Spain, it is the rarest thing in the world to see a murderer pay the penalty of his crime on the scaffold. Perhaps it is not altogether unnatural that the authorities should feel a certain sympathy for the man of a temperament excitable like their own who has been hurried into dealing a fatal blow, when they know that he delivered it in the passion and on the provocation of the moment. It is conceivable that they should even make excuses for the injured relative who has malignantly

followed out a long-planned vendetta; because, although the vendetta flourishes as a specially Corsican institution, it is more or less a time-honoured custom in all the Southern provinces of the mainland. It is less intelligible that statesmen in their sober senses should extend the same consideration to the brigand who has habitually added bloodshed to robbery. Yet the brigands, when they escape the volleys of rough-and-ready bersaglieri whose blood has been warmed by a hot chase in the mountains, may confidently congratulate themselves on being spared to return to their profession and resume their profitable course of crime. They are arraigned at the bar in due course, and trembling witnesses are dragged up to testify against them. They may have been notoriously guilty of scores of aggravated homicides, as in the case of the infamous Manzù, who was unlucky enough to be shot in a scuffle the other day in the neighbourhood of Salerno; and many of these homicides may be conclusively established against them. The jury may be constrained for very shame to pronounce a verdict of guilty, and the judge may pass the sentence of death with timorous mien and faltering accents. But then the sentence is wanting in the very essential point of a date fixed for its execution; and if the convict is not reprieved, he is generally forgotten. In any case, he is consigned indefinitely to a prison where the walls are weak, the window-bars rusty, and the gaoler venal or sympathetic. One way or another, the result is that appearances at the guillotine have always been rare events in Southern Italy, while murders are so common that they scarcely excite a sensation. Things are not quite so bad in France, partly perhaps for the reason that in France murderers would be rash to reckon upon almost absolute immunity. The French prisons are secure enough, and convicts sent to the galleys or the foreign penal settlements know that they have to serve out the long periods of their sentences, which generally are made sufficiently disagreeable to them. Moreover retributive justice not unfrequently embodies itself in the pestilential climate of Cayenne or Lambessa, and the death penalty is exacted indirectly, although blood does not flow on the scaffold. But if the murderer happens not to die a natural death, it is not the fault of his countrymen who serve on juries. The popular verdict of "guilty with extenuating circumstances" has long ago passed into a proverb and a byword. It does not mean that there is much excuse to be made for the man who has chopped his mother into little bits on a domestic difference as to the consumption of cognac; or that the temptation justified the deed in the case of that other poor fellow who has disposed of a whole family for the sake of the trifling sum to be found in the portemonnaie of the *père de famille*. It simply means that juries object as a matter of sentiment to inflicting the last punishment authorized by their penal code; they would rather that the culprit were spared than that they should have to hold themselves in any degree responsible for his blood.

This misplaced leniency may possibly be less injurious with our neighbours than it would be with us. Assassination in Southern countries is so often a sheer matter of impulse that there seems scarcely time for a calculation of consequences. Still, there is elsewhere, the old maxim holds good, that desperate diseases demand sharp remedies. Until the other day it was considered almost hopeless to attempt the suppression of Italian brigandage. It was said to be inherent in the very nature of the people. Now, however, it appears to be in a fair way to be put down, thanks to the thoroughgoing proceedings of General Pallavicini. It was argued that the brigands must always coerce the peasants and the shepherds among whom they lived into giving them aid and warning. The certainty of being shot on the spot for refusing must needs prevail over the more remote risk of being shot by the troops for consenting. It seemed hard on helpless peasants to reduce them on a sudden to a dilemma so dangerous. However, there was no help for it; it was declared that those who gave food or information to brigands should be treated precisely like the brigands themselves. The peasants were left to arrange matters as they might; and the result is that the worst districts of Calabria have now become comparatively safe. So, we fancy, it would prove were some similar course pursued towards the national weakness of always having recourse to deadly weapons. Were the penalty of death rigorously enforced even when the culprit could plead passion or provocation, we suspect it would have an immediate effect on the statistics of crime, and would prove the truest kindness to the people in the long run. No doubt there would be a good deal of grumbling at first over the examples made of ardent and sensitive natures, contrary to all precedent. But the more excitement these examples created the deeper would be the impression they would make. Brawlers would learn to drink and quarrel under the abiding sense of a new danger; and the cooler spectators of a dispute who saw whither excitement was hurrying the principals would more often be induced to interpose in time. Besides, if the law really set itself in earnest to the task of suppressing homicide, it might enforce some useful precautionary legislation in the interest of the dangerous classes themselves. When brawls are of daily occurrence, and murders are perpetrated with comparative impunity, it would be idle as well as unjust to order peaceable people to leave their weapons at home. Should the law interfere seriously for the protection of life, no measure would more recommend itself to common sense than one which made it penal to carry offensive weapons.

The English as a nation are particularly unlikely to have any excessive sympathy with the squeamishness of the late Premier of Spain. Indeed the tendencies of our legislation used to be quite the other way, and until quite recent times the spirit of our

criminal jurisprudence sinned rather on the side of severity. In Spain and Italy, when by chance a capital sentence is to be executed, the criminal meets his end with a coolness which almost amounts to heroism. It is the judge, the officials, and the onlookers whose sensibilities are excited over the tragical dénouement. In England, on the contrary, it was the authorities, from the very highest down to the hangman, who showed themselves cool and impassive while whole batches of offenders were dismissed from the dock to their cells and submitted to the final sentence of the law. *Autos-da-fé* have not been in fashion with us for some hundreds of years; they were always an exotic institution, and our people never took very kindly to them. But long after *autos-da-fé* had gone out of date even in the chosen land of the Church and the Inquisition, the law continued to provide the English public with an abundance of popular entertainment to the full as exciting. We have grown more sensitive and scrupulous than our fathers; and as cities are drained and sanitary boards are multiplied we set greater store by human life. We ventilate our prisons and provide their inmates with a diet which is almost luxurious, although we have to maintain our prisoners longer in consequence; and now we confine the unfortunates convicted of petty thefts, instead of hanging them out of the way and having done with it. We should shudder at the idea of some dozen of human beings, men, women, and mere children, listening in the condemned cells of Newgate for the tolling of St. Sepulchre's bell. We should think it altogether beyond the limits of good taste were the members of the very fastest set in good society to make up a little supper party at the "Magpie and Stump," that they might be ready to enjoy the spectacle of the morning. We confess that, on the whole, we see matter for congratulation in our altered tone, as well as in that still more recent change which did away with executions in public. As spectacles they were neither edifying nor attractive, and for one bystander who accepted them as a warning, there were undoubtedly twenty who were much the worse for the sight. From the prisoner's point of view they were more objectionable still. We advocate death as the fitting penalty of deliberate murder, but we protest against its being preceded by torture. We may take human life as a public necessity, but we have no right to disturb the last moments of the unhappy sufferer more than need be. And while there were hardened criminals who felt a miserable pride and pleasure in that last appearance before the scum and drags of the city, those of more impressionable or less vitiated natures must have dreaded facing the mob below the gibbet even more than the shameful death that awaited them. In changing the closing scene to the seclusion of the prison, we obeyed the dictates at once of humanity and decency. We have gradually been leaning to the side of mercy, and in his punishment as in his trial we incline more and more to give the culprit the benefit of any doubt. We only hope that we shall not end by adopting the silly humanitarian theories for which Señor Sahueron has sacrificed himself, although we cannot feel unqualified confidence that England may not, in the hands of certain Ministers whom we can imagine, move even faster than Spain. Yet these private executions still leave something to be desired, and there are certain improvements in the arrangements which we should like to see adopted. Such scenes as that which was witnessed last week at Kirkdale can only strengthen the hands of the sentimentalists who would abolish death punishment altogether. There is no need to dwell on revolting details which have probably come under the notice of every reader. Suffice it to say that, when the bolts were drawn, the rope broke with the weight of the unfortunate man. He never lost consciousness. When the bitterness of death should have been past with him, he had to take his seat under the gibbet and go through the mockery of listening to the ministrations of the chaplain, while the prison authorities were making fresh arrangements to despatch him. We do not know with whom the responsibility rests, but we are sure some one should be held responsible for so cruel a catastrophe. It is not the first accident of the kind that has happened recently, and a very few more of such cases would make capital punishment all but impossible.

THE THAMES AT RICHMOND.

DURING the last fortnight the *Times* has published a number of letters upon the condition of the Thames at Richmond; and while the discussion has proceeded the change of summer to autumn, and heavy and continued rain, have probably mitigated for the time the evil which occasioned the correspondence. This evil is, however, certain to reappear in full force unless a remedy be applied; and, indeed, the necessity of a remedy is admitted, and the only question that remains is as to the form which it ought to take. The Richmond Vestry have printed as a pamphlet the correspondence between themselves and the Conservators of the Thames, and they appear to expect by this means to obtain the support of public opinion in urging a particular plan on the Conservators. But the question between the engineers of the Conservators and the engineer of the Vestry must be settled in case of need, not by newspaper discussion, but by reference to some other engineers competent to decide between opposing views. The Conservators have consulted Sir John Coode, C.E., and Captain Calver, R.N., who recommended that the navigation between Teddington Lock and Kew Railway Bridge should be improved by dredging. The Vestry of Richmond have obtained from Mr. Abernethy, C.E., a report which, as they say, "proves conclu-

sively" that the erection of a lock and weir at Richmond is not only the most feasible, but the most desirable, plan for improving the navigation above that town." But if the arguments adduced by Mr. Abernethy are not in themselves sufficient, we shall scarcely accept them on the authority of the Richmond Vestry. It is at least doubtful whether the proposed lock and weir might not seriously affect the navigation below Richmond, whereas the plan of dredging can certainly do no harm; and at worst a considerable sum of money might be expended on this plan without adequate result.

The inhabitants of Richmond and Twickenham presented to the Conservators a Memorial dated June 3, 1871, of which an abstract appears in the pamphlet now before us. It is really a pity that a mere abstract should be given of a composition which must be at once scientific and pictorial. It urges that a lock and weir would not only remove existing evils, "but would impart even greater beauty and attractiveness to the refreshing appearance which the river formerly possessed." The unsightly river mud in the well-known and much frequented districts of Richmond and Twickenham would disappear after the construction of the proposed works, the river would disclose beautiful banks, and its reaches would become charming and effective, "totally unsurpassed in beauty in any other locality." The style of the late lamented George Robins, however admirable in itself, is perhaps not the most suitable for conducting the discussion of what is after all an engineer's question. The Conservators, in answer to this Memorial, state some of the objections which they entertain, and which they regard as insuperable, "to the proposal to erect a weir at Brentford which shall altogether exclude the tidal water." This water, of which the quantity is very large, exercises at present a most beneficial effect on the river below by the scour which it produces. Analogous cases are not wanting to justify the apprehension of the Conservators that a most serious silting up of the river would ensue, and it is the duty of the Conservators to prevent any work which may interfere with the navigation below bridge or may affect the commercial interests of the Port of London. "To cut off the enormous volume of tidal water which flows up between Brentford and Teddington, a distance of five miles, would in the opinion of the Conservators be productive of serious injury to the trade of London." This is the substance of the objection which the Conservators entertain to the proposed lock and weir. They have been advised by experienced engineers that it is a well-founded objection, and even if the engineer of the Richmond Vestry can produce a forcible answer to it, the only effect must be to show that further investigation is desirable. The memorialists reply to the Conservators that they did not propose a weir which should altogether exclude the tidal water, and they regret that the answer of the Board to their Memorial should have been founded on an erroneous conception of its meaning. This correspondence took place in 1871, and we may assume that the engineers recently consulted by the Conservators considered the expediency of a weir in any form. The Report of Sir John Coode and Captain Calver is not before us, and the remarks of Mr. Abernethy, dated the 24th of July last, upon that Report merely show that he adheres to his former opinion, while they would probably maintain their own. The engineer of the Richmond Vestry makes the important admission that the engineers of the Conservators have, "under existing circumstances," some reason to complain of the discharge of sewage from the town of Richmond and its neighbourhood, and the public may perhaps think that the local nuisance should be remedied before complaint should be made of that which is general. It is strange to find the inhabitants of Richmond discouraging eloquently on the beauty of the Thames and at the same time converting it into a common sewer. Mr. Abernethy admits that by dredging the depth of water may be increased at least temporarily above Richmond Bridge, but he demands for his clients a depth of clean water. He may be answered, at least for the present, in the proverb that the kettle should not call the crock "smut."

If the Richmond Vestry desire that the question which they agitate should be fully understood, they will endeavour to procure the publication of the Report of Sir John Coode and Captain Calver, to which they will be at liberty to append any comments which their own engineer may desire to offer. We observe that Mr. Abernethy quotes from page 22 of this Report, so that it must contain a tolerably complete examination of the question, and it is mere groping in the dark to attempt discussion without having this Report before us. An engineer writing lately in the *Times* goes over some of the ground which has probably been traversed by the authors of the Report. He points out that the tide at Richmond now ebbs much lower than it did in former years, and the change is due to the removal of Old London, Blackfriars, and Westminster Bridges, and the substitution of modern structures with ample water way, combined with extensive dredging operations. Old London Bridge, as is well known, acted as a partial weir; the spring tide rose six inches higher on the lower than on the upper side of it, and there was a fall of from three to five feet of water at the ebb, which necessitated the critical operation called "shooting" the bridge. By the removal of these obstructions the tide now flows higher by six inches above bridge than it did in former years, and it ebbs about four feet lower, adding, says the engineer, about twenty-five per cent. to the tidal volume of water passing up and down twice a day, and producing a rapid lowering of the bed of the river, and greater exposure of the foreshore mudbanks. The same engineer expresses the opinion that the tide cannot be kept back or affected by the recently constructed

Embankment, and that the tide probably makes a higher mark between Blackfriars and Chelsea than it did prior to the construction of the Embankment. This opinion appears to agree with that of the advisers of the Conservators, who are quoted by Mr. Abernethy as saying that the Embankment "has little effect upon the tidal propagation in the Upper Thames." In answer to the complaint of the Richmond Vestry that water is abstracted by the Water Companies above Teddington Lock, this engineer says that this volume of water can bear no comparison with the additional quantity of tidal water, "the great natural conservative agent," admitted upwards since the removal of Old London Bridge. The Richmond Vestry would doubtless answer that it is a question not only of quantity but of quality, and that the clear water which used to come down to them is abstracted, while dirty water is sent up to them instead of it. At present Richmond is itself in default. The treatment of its sewage is, as its representative confesses, an "unanswered difficulty," and the Vestry is "most anxiously and earnestly at work" to discover a proper solution of this difficulty. The deliberations of the Vestry are likely to be quickened by the compulsory clauses of an Act of Parliament which requires that all towns in the Thames Valley should divert their sewage from the river. They must solve the "unanswered difficulty," and when they have solved it, they may reasonably complain of the fouling of the tidal stream by the sewage outfalls at Barking and Erith. This fouling appears to be admitted by the advisers of the Conservators, who say, in a passage quoted by Mr. Abernethy, that the waters of the Thames are "heavily charged with material in the summer season;" and experience shows that wherever waters so charged are brought to a state of comparative quiet (as they would be in the upper portion of a tidal river), "they quickly deposit the matter they hold in suspension," or, in other words, they leave "a slight coating of mud" upon the towing-path when the tide ebbs. All visitors to Kew and Richmond will agree in wishing that the Thames, once called "silver," could be prevented from depositing black and offensive slime along its banks, and they will think sewage, whether native or imported, an equally hideous feature in an otherwise lovely landscape. Yet we cannot but admire the cool audacity of the Chairman of the Lock Committee of the Richmond Vestry, who "gently puts by" the question of the local nuisance, and concerns himself only with "the speedy attainment of an adequate supply of pure water," which he and his fellow-townsmen are ready to defile. One is almost comforted to read, on the day on which this letter was published, an announcement of the appearance of the signs of early winter at the English lakes. Tourists who have been recalled from their holidays, whether in these islands or the Continent, are able to console themselves with the reflection that they have not left much good weather behind them. Only three weeks ago a party of Englishmen at Trêves were heard expressing their indignation because the Moselle had ceased to be capable of floating a steamer, and the managers of the Luxemburg Railway had not advertised this deficiency at their stations. There is doubtless water in the Moselle now, but perhaps there are not many tourists who desire to embark upon it. The "burning question" of the Thames at Richmond has been temporarily quenched; and perhaps the Chairman of the Lock Committee may now have leisure to reflect that the deliberate judgment of experienced engineers is not likely to be shaken by the pamphlet which he has circulated. The public will desire that the question should be thoroughly discussed. At present only one side has been heard—namely, the Vestry; and we do not think that they make out a strong case. At any rate it will be time enough to build the proposed lock and weir after dredging has been proved to be an ineffectual remedy.

POST AND DILIGENCE IN SWITZERLAND.

IT is difficult to praise too highly either the character of the Swiss people or the arrangements which they make for the accommodation of travellers in their country. They do well almost everything that they undertake, although they require a wonderful time to do it. But, as everybody who travels at all goes to Switzerland, it may be worth while to consider whether it be not possible to induce the authorities to make some further concessions to the habits and prejudices of Englishmen. There is, as every traveller knows, a standing grievance in the post-office. Complaints are perpetually made, but hitherto without redress. A case which occurred lately may be taken as the type of many others, and it will serve to show that the Swiss, although painstaking and generally accurate, commit errors in simple matters which in England would be impossible.

An Englishman arrived at Lucerne about 7 P.M., and went immediately to the post-office, handed in his card, and asked for letters. He was told that there were none for him. He then went to an hotel and engaged a room, and returned to the post-office to inquire for a bag which he had sent ten days before from Thun. By inadvertence he applied at the window of the post-office which is appropriated for letters, handed in the same card, and asked for a bag from Thun. The officer, not hearing or not understanding what was said, took the card, and began searching the heap of letters which he had searched before. Almost instantly he remarked, "I have had this card before"; and the Englishman, apologizing for the mistake, took the card to the opposite window and applied for his bag. The officer at that window looked into a pigeon-hole, found a ticket or memorandum of the name, produced the

bag, asked for the key, tried it by unlocking and locking the bag, took the signature of the owner to a receipt in a book, received the sum charged for carriage, and delivered out the bag. One cannot speak too highly of the convenience which this system affords to travellers. You start for a week's excursion, which you might prolong for a month if you pleased, and at the end of it there is your luggage waiting for you at the place to which you sent it. But this same Englishman, having spent the morning in Lucerne lounging and watching the weather, and planning a fresh excursion, went in the afternoon to the post-office, handed in the same card as before, and received two letters which had been lying there, as the postmarks showed, for several days. The letters showed that his presence in England was necessary, and if he had got the letters when he applied for them he might have been already on the way. The carelessness displayed on one side of this post-office is the more remarkable because of the method and caution adopted on the other. It would be idle to complain to the local authority of what he would regard as an inevitable accident. He would remark that, if you did not get your letter yesterday, you got it to-day; and if you complained of having been detained at Lucerne, he would answer that Lucerne is a very nice place, and contains several objects interesting to strangers. Until one gets used to these occurrences they appear inexplicable and astounding. You see a man of fifty years of age or more, bald, grey-bearded, sober, and respectable. He has probably been the father of a family and performing official and social duties for thirty years. Yet in the discharge of his daily duty he commits an oversight which would be hardly excusable in a child. The Swiss post-offices are open many hours, and it may be suggested that the officers are fatigued by long attendance. But, if so, it would be easy to provide additional clerks during the tourist season. It would appear reasonable to charge a small fee for every letter delivered out at the poste restante, and in a large town to appoint a clerk to attend specially to this business. This clerk should be a woman, as this is a sort of work that women usually do better than men. It is of course very convenient to get a letter from England for three-pence, but few Englishmen would object to pay even sixpence to be sure of getting it. We are told that English writing of English names is perplexing to foreigners; but surely it might be possible for clerks specially appointed to acquire sufficient skill to enable them to read that which is plainly written. People who do not write plainly have only themselves to blame, and it may be worth while to adopt for Continental use a moderately large envelope, because the small letters are in greatest danger of being overlooked. The excuse for non-delivery of a letter "that it was only a little one" may sound absurd in England, but it would probably be thought sufficient by a Swiss postmaster. At a large office the letters awaiting application are arranged alphabetically in pigeon-holes, and perhaps two of these holes may be appropriated to a single letter of the alphabet. It seems ridiculous to suppose that a clerk could search one of these two holes and omit to search the other; and yet there is little doubt that such omissions do occur. These mistakes cannot fairly be attributed to haste, because the clerk is master of the position, and may keep you waiting as long as he pleases while he searches.

Generally if you give a Swiss time enough to do a thing he will do it, and do it well. The diligence creeps at the rate of three miles an hour up a pass, but it gets safely to the top at last. The road by which that ascent is made represents the accumulated result of centuries of toil; and certainly the great roads of Switzerland as they now exist are notable examples of patience, industry, and skill. The carriage road over the Furca has been completed within a few years, primarily for military purposes, and to the great convenience of tourists. The carriage road from Andermatt to Lucerne, down the valley of the Reuss, is an older and even finer work of the same kind. One or two of the old bridges, practicable only for horses, are still standing beside the broad and solid structures which have superseded them, and these old bridges probably represent the condition of this road when the Russians and French fought for the possession of it. One cannot but admire the art with which this new road is made to turn to and from the Rhone glacier in winding upward to the Furca. It may recall the winding of the Thames below London, of which Dryden says:—

He often turns as of his mistress proud,
With longing eyes to see her face again.

But when we have turned finally from the glacier and reached the actual Furca, why, it may be asked, should the diligence spend twenty minutes in that cold and dreary spot? Even in Switzerland horses can be changed in ten minutes, and in England the same thing could be done in a minute and a half. The coachman changes with the horses, and as there was a halt of three-quarters of an hour at the Rhone glacier, the conductor can hardly need refreshment at this next stage. There is nobody to get up and nobody to get down. The station or inn, if it be an inn, may perhaps have a fascinating interior, but it looks particularly uninviting from without. It is plain that the longer the delay the worse will be the weather. Four horses have already been put to in such fashion as to leave place for another. Can it be that we are waiting for the fifth horse? This appears to be the truth, for presently the fifth horse walks up by himself and is put to. In England it would be thought strange that a coach and four horses should be kept waiting for a fifth horse. But this diligence only goes to Andermatt, and as it gets there about seven o'clock, and nobody does anything after arriving except eat, drink, smoke, and

sleep, a quarter of an hour cannot matter either way. It is, at any rate, a triumph to have dragged two or three of the biggest boxes of lady tourists over the Furca, and to have swung them safely round all the curves of the descent. If Englishmen had the management of the Swiss diligences, they would make them go about twice as fast, and would have some awful accidents every season.

Travelling by diligence in Switzerland is likely to continue on some roads for many years, and it may serve to convey some idea of what travelling by mail-coach used to be in England, remembering however that the English were much more rapid and energetic in their movements than the Swiss. The railway which now ascends the Rhone Valley as far as Sierre will be continued before long to Brieg and the Simplon, and then perhaps the question will arise whether a branch railway shall be made to Zermatt. At present the first half of the road from Vierge or Visp to Zermatt is a horse road only, and the second or further half is a carriage road. It can hardly be supposed that this imperfect arrangement will long continue, but if a carriage road is to be made over the first half, it would cost not much more to make a railway for the same distance. It has been said in England that lighter rails and slighter and cheaper work of every kind should be adopted in introducing railways into poor agricultural districts, and the same may be applicable to Switzerland. Such a railway might perhaps pay if worked for four months of the year to Zermatt, and for the other eight months it might cease working. Of course it would destroy the place, according to the ideas of those who knew and liked it as it used to be. It would become another Interlachen, and that is a strong expression. As places become equally accessible they all assimilate in character, and are all pervaded by Cook's excursionists. Having got the railway as far as Zermatt, the next thing will be to carry it to the Riffel, or even further, on the principle which has been applied at the Rigi, and some future Mr. Cook will personally conduct tourists up the Matterhorn. Already a Scotchman is said to have gone up Mont Blanc with no other company than a walking-stick, and nearly all the principal ascents have been made by women. Every ascent makes the way easier for those that follow, and besides, the establishment of hotels at high altitudes has supplied bases of operation which did not previously exist. We may perhaps over-estimate the progress of an inevitable operation, but as surely as a glacier descends into a valley so will the Yankee and the cockney ascend to all the mountains.

It may be asked, not without anxiety and regret, what will become of the Swiss people during this process of Anglicizing and Americanizing Switzerland? The rising generation are in great danger of being corrupted into touts and boggars, and in the districts most permeated by visitors the habit of roadside mendicancy in youth is likely to destroy all independence and strength of character in men. "*Hæc sunt nomina eorum qui, no sacramenti fidem fallerent, fortissime pugnant, ceciderunt.*" Where are the descendants of the people which furnished the Swiss Guards of the King of France? We are sure they must have other descendants than those dirty little boys who hold out their hands for halfpence by the roadside. Whatever may be said of the trade of a mercenary soldier, it was at least more respectable than begging. The Swiss Government should exert itself to suppress this discreditable nuisance, and if it could teach the post-office to do all its work as accurately as it does great part of it, the English tourist would have nothing to complain of except that he is liable to meet another English tourist at every turn of a mountain road. The town of Lucerne as well as other towns in Switzerland would, we think, be improved by the establishment of a few breweries and swimming-baths, after the laudable custom of South Germany. The true idea of beer appears to fade as the German frontier is left behind, and although there are lakes and rivers everywhere, it is almost impossible to find a convenient bathing-place. Some of us English carry with us tubs from home. It is a pity that we cannot also take with us our own post-office.

THE ST. LEGER.

THE breakdown of Gang Forward, on the very eve of his Doncaster engagement, just when he had completed a most satisfactory preparation, and had inspired his friends with the utmost confidence, is the crowning disaster of a stable long notorious for its ill-luck in great races, and of a sportsman so staunch that no disappointments can abate his zeal. It was the more unfortunate because the St. Leger field had already dwindled down to small proportions, and further every one was anxious to see another contest between Gang Forward and Kaiser, who have already run three such desperately close races this year. We need hardly remind our readers that Gang Forward beat Kaiser by a head for the Two Thousand Guinea, that Kaiser beat Gang Forward by a head for the Prince of Wales's Stakes at Ascot, and that the pair ran a dead heat for second place in the Derby, Doncaster defeating them by a length and a half. Both horses having on all occasions displayed undoubted gameness and resolution, it would have been impossible for any handicapper to separate them; and probably, had they both come to the post last Wednesday, we should have witnessed another head and head finish between them. The theory that the Derby running was false, and that the dead-heaters for second place would be able to turn the tables on the Derby winner at Doncaster, was, as events have

turned out, entirely fallacious. As a general rule, the Derby running is subsequently confirmed to the letter, though every now and then there may be an exceptional case to the contrary. Pretender's Derby victory, for instance, was a palpable accident, the wonder being that, under all the circumstances, Pero Gomez got as near him at the finish as he did. It was a certainty that when they next met the result would be different; and at Doncaster Pero Gomez beat Pretender easily enough. A good deal was made out of Bolard beating Doncaster just as far at Paris in the Grand Prix as at Newmarket in the Two Thousand, and of both Kaiser and Gang Forward having beaten Bolard in the latter race; but, as we maintained at the time, what a horse does forty-eight hours after having been tossed about the Chunnel is no criterion of his real merits. Granted that Doncaster ran a stone worse horse at Paris than at Epsom, the journey was quite sufficient to account for it. At any rate, the Derby running was much the more trustworthy of the two to follow; and last Wednesday's race has proved so much. But even supposing, for argument's sake, that Doncaster ran at Epsom somewhat above his true form, what was there to be said against Marie Stuart? It was openly admitted that she was considerably superior to Doncaster; *a fortiori*, therefore, she was superior to Kaiser and Gang Forward. Exception was taken to the style in which she won her engagement last month at York; but just as much exception might have been taken to the style in which Kaiser beat Chivalrous at the same meeting. The critics also were not specially pleased with her in the early part of this week; yet once again last September sustained its character as the mare's month. Marie Stuart has followed in the footsteps of her illustrious predecessors Achievement, Formosa, and Hannah, and the Epsom running has been most strikingly confirmed.

The Leger at one time acquired rather a reputation for surprises, and that an outsider should be one of the first three was looked on quite as a matter of course. The ingenuity of backers was devoted to a search after that particular outsider which should either split two of the favourites or struggle home into the third place; and not unfrequently they were rewarded for their trouble. But this year not only was it vain to look for the winner beyond the first three in the Derby and the winner of the Oaks, but also the most careful scrutiny failed to discover anything else possessing a chance of running into a place. From the very first, Gang Forward, Kaiser, Doncaster, and Marie Stuart—and those four alone—have been supported for the Leger; and the almost unprecedented circumstance of the four favourites for a great race supplying the first, second, and third in it, was predicted as an absolute certainty. There was, indeed, for a week or two a little talk of a horse called Mendip, and if the prayers of the bookmakers could have improved his form about four stone, he might have been returned the winner of the Leger; but York came, Mendip made his appearance in public, and forthwith the bubble burst. Such is the paucity of good three-year-olds this year, that it was doubtful how many owners might think it worth their while to oppose the formidable four; and had not the sudden collapse of Gang Forward brought back to people's minds the extraordinary chances of racing, the field of eight which ultimately faced the starter might have been still further reduced. Three out of the eight, Doncaster, Marie Stuart, and Merry Sunshine, were the property of Mr. Merry; and Kaiser, Chandos, Andred, Negro, and Mestizo—who ran third on Tuesday in the Great Yorkshire Handicap—made up the number. A ninth competitor, Miss Buckland, was in the paddock, but as the three favourites were sound and well, and showed no signs of breaking down, she did not have the trouble of going to the post. Chandos, Andred, and Negro, we need hardly say, were started on the off chance; for unless Marie Stuart and Doncaster had tripped up Kaiser and tumbled over him, there could have been no hope of any one of them attracting the judge's notice. The three favourites were of course the only horses scrutinized in the paddock with any attention; and it was generally admitted that three better trained horses had seldom been brought out for a great race. Kaiser was as compact and muscular as ever, and Doncaster had evidently had a careful preparation, and looked a much improved horse since the Derby. Marie Stuart was, perhaps, the least liked of the three; but she too was perfectly trained. Mr. Merry made no declaration, and, it was understood, supported the horse and the mare separately; but Marie Stuart was ridden by his first jockey in his first colours, and that would popularly be regarded as a hint which was considered by the stable the better of the two. With so small a field the starter had of course no difficulty, and the only one of the eight who lost a little ground at the beginning was Merry Sunshine, whose mission was to force the pace for his stable companions. Hopper, however, speedily got him to the front, and he did his work satisfactorily enough for the first mile, Doncaster, Marie Stuart, and Kaiser following throughout in close company with each other. His mission being accomplished, Merry Sunshine dropped back, and the three favourites came round the bend into the straight together, Kaiser being in the centre, Marie Stuart next the rails, and Doncaster on Kaiser's right. We may add that even at this point there was nothing else in the race, and it was an absolute certainty that to those three would be left the first three places. At the commencement of the enclosure Kaiser was in difficulties, and Doncaster and Marie Stuart raced away from him, and fought out by themselves one of the finest finishes ever seen. No winning declaration having been made, each jockey tried his hardest to win, and both T. Osborne and F. Webb rode admirably. It was as nearly as possible a dead heat between the pair, but the judge's verdict was in favour of Marie Stuart by a

short head. Three lengths off, Kaiser was third, and the remainder were scattered a long way. Had a winning declaration been made, it would have been perfectly legitimate not to persevere with one stable companion against another; but the regret one could not help feeling at the sight of these two gallant horses wasting their powers in racing each other down was mitigated by the satisfaction of witnessing one of the finest finishes that ever took place on the famous Town Moor of Doncaster. The result was in strict accordance with the Derby running—making allowance, of course, for the fact that at Epsom Doncaster was not fit, and that since then he has made the improvement that was anticipated. When not nearly prepared he beat Kaiser by a length and a half; now, when thoroughly wound up, he beats him by double that distance. Similarly, in June, Mario Stuart could give Doncaster 7 lbs.; in September he can give her 5 lbs. and run her to a head. This is about the real state of the case:—Doncaster has improved 12 lbs. since Epsom, and Kaiser and Marie Stuart are about the same now as they were then. Marie Stuart would have won the Derby, had she been engaged in it, by a length and a half from Doncaster, assuming they would both have been ridden out; and this week she beats Kaiser just as far as she would have beaten him then. It is, of course, not to be supposed for a moment that Gang Forward's presence would have made any difference in the result of last Wednesday's race. He has shown himself much too honest and true a horse to admit of any mistake being made in estimating his form. Where Kaiser has finished he has always finished; and where Kaiser finished in the Leger, Gang Forward would have finished also. Two desperate struggles would have gone on at the same moment—one for the first, one for the third place; and, as it was almost a dead-heat for the one, so it would have been almost a dead-heat for the other. But more than that Gang Forward could not have done. Thus, after a long and honourable connexion with the Turf, one of the best of British sportsmen quits it in a blaze of triumph, the Derby, Oaks, and St. Leger having fallen to him in a single year. Not that the yellow jacket and black cap are immediately to disappear from the race-course; for we understand that Mr. Merry intends to run the horses he has in training through their engagements before finally retiring, and rumour credits him with the possession of some two-year-olds worthy of his colours. But it is said that he does not purpose to breed any more racing stock; and we can only regret that there seems no likelihood of any men of his stamp coming forward to supply his place. We wish it were otherwise; for the Turf is not in a very flourishing condition, high prices for blood stock notwithstanding.

We must not omit to mention that since Goodwood one of the finest horsemen of the day has passed away, a victim, like many another jockey, to the exigencies of his profession. T. French was quite in the first class as a rider. No jockey of the present day equalled him in the grace and ease of his seat on horseback; and he possessed a cool head, good judgment, and excellent hands. He was a capital judge of pace, and in the power and resolution of his finishes he approached more nearly to Fordham than any of his professional brethren. He was also a humane rider, and never punished his horses with unnecessary severity. He carried off many of the highest prizes of the Turf, the Derby in two consecutive years falling to his share with Kingcraft and Favonius. His character was unimpeachable, and his services will be greatly missed by his numerous employers.

REVIEWS.

SARA COLERIDGE.*

SARA COLERIDGE, the subject of the Memoir and writer of the letters contained in these two delightful volumes, was daughter of the poet Samuel Taylor Coleridge, and wife of her cousin Henry Nelson Coleridge, a barrister and accomplished scholar and author of merit, whose literary achievements and fame were stunted by weak health and an early death. Sara Coleridge—what associations hover round this name! Her mother was Sara:—

My pensive Sara! thy soft cheek reclined
Thus on mine arm, most soothing, sweet it is
To sit beside our cot, our cot o'ergrown
With white-flowered jessamine and the broad-leaved myrtle—
Meet emblems they of innocence and love!

Such is the beginning of a beautiful poem addressed by the poet to his wife, soon after their marriage, nearly eighty years ago, in 1795, in a little cottage at Clevedon, near Bristol, rent five pounds a year, in which the bridal pair were housed, waiting on the future, and living meanwhile on the scanty profits of literary work provided by the kind-hearted bookseller Cottle. Coleridge and Southey married two sisters, "milliners of Bath," as Lord Byron had the brutality to write. These milliners were admirable women and noble wives. Another sister married about the same time Lovell, a devoted friend of Coleridge and Southey, whose father was a wealthy Birmingham manufacturer, and who, superior in worldly means, eagerly joined with his two friends, whose only wealth was their wits, in the grand scheme of a model colony, Pantisocracy, on the banks of the Susquehanna. Wives were necessary articles in this scheme of emigration to America. Another friend,

Burnet, equally bent on Pantisocracy, proposed to a fourth sister, who, as Sara Coleridge the niece tells us in her fragment of autobiography, proudly refused him, "seeing that he only wanted a wife in a hurry, not her individually of the world." It is refreshing to read Sara Coleridge's account, in the little autobiography which she began not very long before her death, of two maiden aunts, milliners, one of them Martha, who had refused Burnet:—

Talking of struggles and trials of life, my mother's two unmarried sisters were maintaining themselves at this time by their own labours. Aunt Martha, the elder, a plain, but lively, pleasing woman, about five feet high, or little more, was earning her bread as a dressmaker. Aunt Eliza, a year or twenty months younger, about the same height, or but a barleycorn above it, was thought pretty in youth, from her innocent blue eyes, ingenuous florid countenance, fine light-brown hair, and easy light motions. She was not nearly so handsome in face, however, as my mother and Aunt Lovell, and had not my Aunt Southey's fine figure and quietly commanding air. Yet, on the whole, she was very feminine, pleasing, and attractive. Both sisters sang, but had never learned music artistically.

Such were my Aunts Martha and Elizabeth Frierer in youth; but they had sterling qualities, which gave their characters a high respectability. Without talent, except of an ordinary kind, without powerful connexions, by life-long perseverance, fortitude, and determination, by prudence, patience, and punctuality, they not only maintained themselves, but, with a little aid from kind friends, whom their merits won, they laid by a comfortable competency for their old age. They asked few favours, accepted few obligations, and were most scrupulous in returning such as they did accept, as soon as possible. They united caution and discretion with perfect honesty and truth, strict frugality and self-control, with the disposition to be kind and charitable, and even liberal, as soon as ever it was in their power. . . . Upon the whole, they were admirable women.

Seven years pass after marriage, and Coleridge and his wife are settled at Keswick, in the same house with Southey and his wife; and at Greta Hall, Keswick, Sara, the heroine of this charming book, was born December 22, 1802. She had two elder brothers—Harley, the eldest, and Derwent, the present Rector of Ilanwell; a third, Berkeley, died in infancy. Her father wrote a description of her in 1803:—"My meek little Sara is a remarkably interesting baby, with the finest possible skin, and large blue eyes; and she smiles as if she were basking in a sunshine, as mild as moonlight, of her own quiet happiness." She was a weak and delicate child, and at nine years of age was frightened out of her wits when left alone in bed and in the dark; brooding over ghastly pictures which had come across her in books; and, "last and worst, came my Uncle Southey's ballad horrors—above all, the 'Old Woman of Berkeley.'" Here we have a touching notice of her father's tenderness:—

My Uncle Southey laughed heartily at my agonies. I mean at the cause. He did not enter into the agonies. Even mama scolded me for creeping out of bed after an hour's torture, and stealing down to her in the parlour, saying I could bear the loneliness and the night-fears no longer. But my father understood the case better. He insisted that a lighted candle should be left in my room, in the interval between my retiring to bed and mama's joining me. From that time forth my sufferings ceased. I believe they would have destroyed my health had they continued.

But in after life she remembered Southey with no feelings but those of gratitude, affection, and respect. The daughter who edits these volumes writes pleasantly and wisely on the influence of the great minds, Southey's, Wordsworth's, Coleridge's, under which Sara Coleridge's intellect grew and ripened:—

Of all the personal influences which had to do with the formation of my mother's mind and character in early life, by far the most important were those exercised by the two eminent men with whom she was so intimately connected by ties of kindred or affection, her uncle Southey, and her father's friend Mr. Wordsworth. In attempting to estimate the value of these various impressions, and trace them to their respective source, I am but repeating her own remark when I say, that in matters of the intellect and imagination, she owed most to Mr. Wordsworth. In his noble poetry she took an ever-increasing delight, and his impressive discourse, often listened to on summer rambles over the mountains, or in the winter parlours of Greta Hall and Rydal Mount, served to guide her taste, and cultivate her understanding. But in matters of the heart and conscience, for right views of duty and practical lessons of industry, truthfulness and benevolence, she was "more, and more importantly, indebted to the daily life and example of her admirable Uncle Southey;" whom she long afterwards emphatically declared to have been "upon the whole, the best man she had ever known."

There is a third province of human nature besides those of the intellect and the moral sense—that of the spiritual, where the pure spirit of Sara Coleridge breathed freely, as in an "ampler ether, a diviner air." In these serene and lofty regions she wandered hand in hand with her father, whose guidance she willingly followed, with a just confidence in his superior wisdom, yet with no blind or indiscriminating submission. He, like herself, was but a traveller through the heavenly country, whose marvels they explored together; and the sun of Reason was above them both to light them on their way.

In youth she was a retired and severe student. She read the best Latin and Greek classics in the ancient languages, having acquired them, says the daughter, mainly by her own efforts; and in the same way she also learned French, Italian, German, and Spanish, and made herself well acquainted with natural history in all its branches, especially botany and zoology. Before she was twenty she worked out by herself a translation of a Latin book of an Austrian missionary in South America, Dobrizhoffer's "Account of the Abipones, an Equestrian People of Paraguay." Her translation filled three octavo volumes; she got 125*s.* for it. The work was undertaken by her to assist a brother in his college expenses, and it is pleasant to add that the assistance was in the end not needed; the brother obtained the money by his own exertions, and Sara was able to invest the produce of her pious labours on her own account. Dobrizhoffer done, she was next year engaged on another translation from the French of the sixteenth century, "Memoirs of the Chevalier Bayard"; and it was about this time that she was seen by the author of *Philip Van Artevelde*,

* *Memoir and Letters of Sara Coleridge*. Edited by her Daughter. London: Henry S. King & Co. 1873.

who went to visit his friend Southey, in whose house Sara Coleridge was staying. Sir Henry Taylor has written an interesting letter to Sara Coleridge's daughter Edith, who edits these volumes. The fair skin, the large eyes, and the quiet gentleness which her father commemorated in babyhood remained at twenty-one, and are thus portrayed by one whose poetry and prose—see the chapter in the *Statesman* concerning the amusements of a statesman—attest his appreciation of woman's beauty:—

I have always been glad that I did see her in her girlhood, because I then saw her beauty untouched by time, and it was a beauty which could rest in one's memory for life, and which is now distinctly before me as I write. The features were perfectly shaped, and almost minutely delicate, and the complexion delicate also, but not wanting in colour, and the general effect was that of gentleness, indeed I may say of composure, even to stillness. Her eyes were large, and they had the sort of serene lustre which I remember in her father's.

The large serene eyes are well rendered in the two engravings which adorn these beautifully got-up volumes, one from a miniature of early life, and the other from a portrait by Samuel Laurence in her widowhood. The large eyes and fine complexion and gentle manner again appear in the well-known poem "The Triad," in which Wordsworth described her, when she was twenty-six, with her two friends from childhood, his own daughter Dora, and Sara's cousin Edith Southey:—

Come with each anxious hope subdued
By woman's gentle fortitude,
Each grief, through meekness, settling into rest.
—Or I would hail thee when some high-wrought page
Of a closed volume lingering in thy hand
Has raised thy spirit to a peaceful stand
Among the glories of a happier age.
Her brow hath opened on me—see it there,
Brightening the umbrage of her hair;
So gleams the crescent moon, that loves
To be described through shady groves.
Tenderest bloom is on her cheek;
Wish not for a richer streak;
Nor dread the depth of meditative eye.

The "anxious hope subdued by fortitude," the "grief through meekness settling into rest," are references to an engagement which had now subsisted for six years, and which was to be crowned in the next by a happy marriage. She had first met her cousin Henry Nelson Coleridge, in 1822, at Highgate, in the house of Mr. Gillman, where her father was domiciliated. The dreadful habit of opium-eating, contracted through illness and severe pain, had completely overmastered the poet, and he at last found wholesome and friendly refuge in the care and under the roof of Mr. Gillman, an excellent surgeon and a wise and benevolent man. He had been living there since April 1816, and continued to live there till his death. Sara was married September 3, 1829.

Sara Coleridge's correspondence in this work begins in 1833. Her father died July 25, 1834. The Gillman household was inconceivable; the servants wept for the kind, considerate old man. The accounts of his exceeding amiability carry us back to the early days in which Wordsworth described him in his "Stanzas written in my Pocket-Copy of Thomson's Ode of Indolence." Sara Coleridge thus describes her husband's feeling towards her father:—

My dear Henry was deeply sensible of his good as well as his great qualities; it was not for his genius only that he revered him, and it has been one of many blessings attendant on my marriage that by it we were both drawn into closer communion with that gifted spirit than could otherwise have been the case.

For Sara and her husband lived in London, and Coleridge at Highgate in isolation from his family. In the very beginning of 1843 Sara Coleridge lost her husband. There were two children; three, two of them twins, had died in infancy. Sara had been indefatigable in training her children, and was equal to teaching Latin and Greek to her son. She nobly resigned herself to her great loss. Here is a characteristic letter written to Mr. Justice Coleridge, her husband's brother, when death was inevitable and imminent:—

January 1847.—I now feel quite happy, or, at least, satisfied. Could I arrest his progress to a better sphere of existence by prayer, I would not utter it. When I once know that it is God's will, I can feel that it is right, even if there were no such definite assurances of rest and felicity beyond this world. I cannot be too thankful to God, so far as my own best interests are concerned, that He is thus removing from earth to heaven my greatest treasure, while I have strength and probably time to benefit by the measure, and learn to look habitually above; which now will not be the spirit against the flesh, but both pulling one way, for the heart will follow the treasure. Thus graciously does the Blessed Jesus condescend to our infirmities, by earthly things leading us to heavenly ones.

In September 1845 her mother, who, old and infirm, was living with her, died suddenly while she was absent on a short visit. The successive deaths of those dear to her figure largely in this correspondence; each is the subject of touching letters; and, forced to select, we prefer quoting from these, as they present her character in a most lovable aspect, and each of those she mourned is a character of public interest in the Coleridge group. She now writes about her mother's death to Mr. Justice Coleridge:—

I feel more than ever the longing to go and join them that are gone—but for my children. But the greatest tie to earth is gone from me, for even the children could do better without me than she could have done.

I always looked forward to nursing her through a long last illness. I know not how it was, I could never help looking forward to it with a sort of satisfaction. I day-dreamed about it—according to the usual way of my mind—and cut it out in fancy all in my own way. She was to waste away gradually, without much suffering, and to become more and more

placid in spirit, and filled with the anticipation of heavenly things. I thought, too, that this would help to prepare me for my change. Now I seem as if a long cherished prospect had been snatched away from me. I thank God I was not thus suddenly separated from Henry.

In January 1849 her eldest brother, Hartley, died. His dying bedside was attended by Wordsworth, soon himself to die in very old age. Sara Coleridge wrote at this time to a lady friend:—

It soothes me to think of all the love and sorrow of the Wordsworths, and that by their wish—it would have been his too—his remains are laid as near as possible to the spot where they are to lie, in the south-east corner of Grassmoor churchyard, near the river, amid the cluster of graves which belong to the Wordsworths,—dear bright-minded, warm-hearted Dora, who never spoke of him but with praise and affection,—and others of the family still earlier removed. But oh! how little did I think that I was never to see him more!

Yet fifteen months more, and in April 1850 Wordsworth, the friend of Sara from infancy, the dear instructor of her youth, died, at the age of eighty. His death was quiet and painless. Sara Coleridge writes:—

Thank God, that our dear and honoured friend was spared severe suffering! For days I have been haunted and depressed with the fear that he had to go through a stage of protracted anguish. He could afford the torpor of the dying bed. His work was done, and gloriously done, before, and will survive, I think, as long as those hills amid which he lived and thought, at least, if this continues to be a land of cultivated intellects, of poets and students of poetry.

Sara Coleridge's own time of leaving the world came, after an illness of a year and a half, on May 3, 1852. She had lived nine years of widowhood, and the education of her children had been her principal employment. There are few mothers equal to teaching a boy *Cæsar* and *Virgil*; but the woman is a very rare phenomenon who can read *Homer* and *Aristophanes* with a son preparing for Oxford honours. Much of her widowed time had been spent in editing her father's works; in this she had aided her husband while he lived, and on his death the whole work devolved on her. Her essay on *Rationalism* appended to the last edition of the *Aids to Reflection*, and her abundant notes and dissertations on the *Biographia Literaria*, attest her qualifications for the task. We should say indeed of her edition of the *Biographia Literaria* that it would have been better both for the father's fascinating book and for the daughter-editor if she could have confined notes to simple facts and trivial ordinary explanations, and woven her own brilliant thoughts and varied learning into a separate, continuous, systematic treatise, which might have appeared, in equal dignity of type, as part of one composite work. Such a result might yet possibly be achieved by the pious labour of her clever daughter. The book at present, studded and overcharged with long small type notes in brackets and appendices, is an uncomfortable one, and Sara Coleridge has done injustice to herself.

We are compelled to leave these volumes with a feeling that space does not permit us to give an adequate idea of all the various interest of Sara Coleridge's correspondence. We could have wished to give specimens of her very just, subtle, and concise criticisms on authors of every sort and time—poets, novelists, historians, and philosophers. We refer specially for samples of acute criticism in few words to passing remarks on Dr. Chalmers, Walter Savage Landor, and Sir Arthur Helps. She worships Milton, the man as well as the poet, and is unusually appreciative of Dryden. She has made an important contribution to a subject already very rich, Wordsworth criticism. Sara Coleridge, as she is revealed, or rather reveals herself, in the correspondence, makes a brilliant addition to a brilliant family reputation.

AMOS'S ENGLISH CONSTITUTION AND GOVERNMENT.*

PROFESSOR AMOS tells us in his Introduction that the writing of the present book "extended over a considerable period of time, and from day to day, as each part of it was composed, that part was submitted to the Commissioners of an illustrious Foreign Government, for whose use alone the work was undertaken." What Foreign Government is referred to is, we dare say, no secret among the initiated; for our own part we cannot so much as guess. But we can quite understand the effect which has been wrought on Mr. Amos's book by its owing its origin to such a cause. In a Primer of the English Constitution and Government written under ordinary circumstances we should have looked for two things, both of which are largely wanting in the book before us. We should have looked for a fuller account of the historical origin of our institutions, and we should have looked for a clearer distinction between those points in our Constitution and Government, as practically understood, which rest on the enactments of the written law, and those no less important points which are simply matters of conventional understanding. Mr. Amos gives us hardly anything on the first head, and very little on the second. No doubt the illustrious Foreign Government was, not unnaturally, careless on both heads. Its Commissioners doubtless wanted to know the actual working of the English Constitution at the present time, rather than the process by which it came into being, or the often subtle distinctions between its strictly legal and its conventional features. The difficulties which Mr. Amos felt in this matter are set forth in his own preface:—

One great difficulty experienced by the writer arose out of the historical character of most of the institutions of the English Government. Not to deal in any measure with this historical character must be to leave large

* A Primer of the English Constitution and Government. By Sheldon Amos, M.A. London: Longmans & Co. 1873.

masses of the subject wholly unintelligible. To dwell unduly on the historical aspects even of any portion of the subject would distract the attention from the main purpose in view, and, in fact, deluge the mind with what, in the present case, could only be irrelevant matter. Thus a constant exercise of discretion was needed as to when to admit, and when to exclude, references to historical antecedents.

Another difficulty of the same kind as the former one turned on the question as to what were the actual institutions which ought to be presented to the attention of a Foreign Government as characteristically English at the present day. Certainly institutions on the verge of becoming obsolete ought not to be presented. Nor, on the other hand, ought wholly new and scarcely tried institutions to be so presented. It rested with the writer in every case to use his own discretion, and only to represent those institutions as permanent and eminently characteristic which he himself believed to be so.

Through this last distinction Mr. Amos says that he has been in many cases compelled to take a side, and, in describing recent measures, to point out the arguments for or against them. Of this no reasonable person can complain, even when Mr. Amos does take a side. But in many cases he judicially sets before us the arguments on two sides, or on more than two sides, without committing himself to any of them. Thus, while speaking of the House of Lords, he draws out at length the current objections that are made to its constitution, and the remedies which are suggested. But he does not commit himself to any of them, unless, as he uses two formulas, "It is felt," and "It is felt by some," we are to understand that the things which are "felt" express his own feelings, while those which are "felt by some" express the feelings of others. If so, Mr. Amos decidedly commits himself to the necessity of having an "other House" of some kind, but he does not commit himself either to the present constitution or to any scheme for improving it. Mr. Amos's account of all things relating to the central Government is clear and accurate enough. From our own point of view, we hardly like to see the existing state of things described, either with so little notice of its historical origin, or with so little of comparison with the institutions, past and present, of other countries. But of these two chasms the Commissioners of the illustrious Foreign Government could most likely fill up the second for themselves, while they most likely did not care about having the first filled up at all. And anyhow it is much better to give an accurate view of things as they are, and to leave their origin untouched, than to put forth such astounding speculations about past times as Blackstone wrote and Serjeant Stephen did not always cut out. It was better to be simply told that the succession to the Crown is regulated by an Act of Parliament passed in 1700 than to flounder about like Blackstone in attempts to show that, because the Crown is hereditary now, therefore it must have been hereditary always. It is a great thing to be right as far as you go, and Mr. Amos commonly takes care to be that. Yet even he cannot help telling us that "the Sovereign is said to be the 'head of the National Church.'" We suppose it is hopeless to try to get this notion out of the head of any lawyer; still it is wearying to have to repeat for the thousandth time that the title which was borne by Henry and Edward was laid down by Mary, and not taken up again by Elizabeth. And the description which Mr. Amos gives between commas, as if it were a formal title, makes the thing queerer still; for though two Sovereigns were called "Supreme Head of the Church of England," no one was ever called "Head of the National Church."

An example of Mr. Amos's doctrine "that wholly new and scarcely tried institutions ought not to be presented to the attention of a Foreign Government as characteristically English at the present day" comes out when he has to describe the manner of Parliamentary elections. The old mode of open voting is very properly described as fully as the new mode of voting by Ballot. The Foreign Government can thus learn exactly what the change is. Indeed Mr. Amos's account almost reads as if the description of open voting had been written while it was still law, and as if the description of the Ballot had been added afterwards. And Mr. Amos brings out what many people never could be made to understand—namely, that the show of hands was a real election, and that the poll was simply an appeal from the show of hands, or rather, in strictness, from the Returning Officer's decision as to the show of hands. Hardly anybody seemed to take in the fact that, if the party defeated on the show of hands did not demand a poll, the election by the show of hands was perfectly good. On the other hand, Mr. Amos seems hardly to see his way through the popular confusion about a man having two votes—that is to say, his being able to vote for two or more candidates; and in p. 14 he says:—

The method adopted in those exceptional constituencies, in each of which three or four Members have to be elected, is to allow each elector to vote for all the candidates but one. In this way, if any one candidate have a fair number of supporters who vote for him and for no one else, even though they do not compose a majority of the voters, he is pretty sure to be elected.

What is evidently meant is, not that each elector can vote for all the candidates but one, but that he can vote for a number of candidates less by one than the number of members to be elected.

Now and then Mr. Amos seems to indulge in a mild vein of sarcasm, as when he says that "there is no rule against long speeches, but if a member is over-long or tedious, the House sometimes interrupts him by making a great noise." And again, after describing the right of petition, Mr. Amos says, "Sometimes petitions have many thousands of names attached, and they are said to have a certain influence on the House."

In the part which relates to local government, or at least to the local administration of justice, Mr. Amos seems to have taken

less pains than in the part which relates to the general government of the country. It is hardly accurate to say that Justices of the Peace "must be chosen from residents in the county holding land worth at least a hundred a year." Nor are all Justices quite so hardly worked as they would be if, as Mr. Amos twice tells us, Petty Sessions were "held in each town or even large village in the county about once a week." Nor is it true to say, with regard to cases tried at Petty Sessions, "Even in these cases the prisoner can generally, if he prefers it, have his trial take place at Quarter Sessions instead of at Petty Sessions." This only applies to those cases, a small minority of those which come before Petty Sessions, which come under the Criminal Justice Act, and in these it is worth noticing that the prisoner almost always prefers the more summary method of trial. The Grand Jury is spoken of twice. In the first case it is said to be formed of "persons living in the county, and not very poor." In the next page we read:—

Grand Jurymen must be freeholders—that is, having an estate in land for life at least—resident in the county. They are usually taken from among the Justices of the Peace. It has already been seen that their function is to determine at Quarter Sessions or at Assizes whether a trial of a prisoner shall take place or not.

A reader might from this be led to suppose that a Grand Jury at Quarter Sessions usually consists of Justices of the Peace, which of course is impossible where the Justices themselves form the Court. So directly after we read "Special Jurymen are persons described as 'esquires,' 'bankers,' or 'merchants,'" without any mention of the new class which has been added to those three. Once or twice also we are told that one of the duties of Petty Sessions is "granting licences to shoot certain birds"—a duty which we had always thought was laid on quite another class of functionaries. Nor again do we in the least understand the following description:—

The County Constabulary in each County or Parliamentary Division of a County consist of—

A Chief Constable, (appointed by the Justices in Quarter Sessions); or two Chief Constables, if the County has been so divided as to send Members of Parliament for each Division.

What has the Chief Constable to do with the Parliamentary divisions of the county? Perhaps Mr. Amos is thinking of counties like Yorkshire and Sussex, which are divided for magisterial as well as for Parliamentary purposes.

In quite another department we are surprised to see the Admiralty and Ecclesiastical Courts put under the head of *Common Law*. Have both "corpora juris" so utterly vanished from among us? On the other hand, we hear in another place, still more oddly, of "Civil Law proceedings in the Court of Queen's Bench, and in other Courts" which we had always looked on as purely insular.

Mr. Amos has some remarks on what he calls "an increasing tendency in England at the present day, at the bidding of medical or other scientific specialists, to commit practically irresponsible functions to the police." His remarks on this head are strongly put, and are worthy of attention. We do not understand what Mr. Amos means by a sentence in his last page but one:—

Most of the buildings, that is, the churches and cathedrals, used for public worship are, in some sense, the property of the nation, and are only used by the ministers of the Church appointed from time to time as trustees for the nation.

All the appointments to Bishoprics, Archbishops, and Deaneries (that is, the presidency of bodies of ministers attached to a cathedral church, and called "Chapters,") are in the gift of the Crown, and a large number of appointments to minor positions, or "livings," are also in the gift of the Crown.

In what sense are churches the property of the nation? In what sense are those, whether clergy or congregations, who have a freehold right in them trustees for the nation? We should certainly not have expected Mr. Amos to fall into the vulgar notion that, because the tenure of Church property, like the tenure of anything else, can be altered by Act of Parliament, therefore Church property or ecclesiastical buildings are "the property of the nation" in some unexplained sense in which other freeholds are not.

JERNINGHAM ON GREECE AND THE PORTE.*

BEING appointed to fill the minor diplomatic post vacated by one of the victims of the unhappy affair at Deliss, Mr. Hubert Jerningham has filled a very agreeable volume with the tale of his excursions from time to time during the last three years among scenes of classic or Oriental interest. He has brought to his task the resources of a good classical education, a considerable amount of historical and general reading, and ready powers of observation. His style, though none the better for an intermixture of slang, which seems not so much natural to him as affected in deference to what may be presumed to be a fashionable taste, is lively, clear, and picturesque. Going over ground by this time thoroughly trodden and familiar to educated readers, he had of course no great material for novel or original remarks, or for discoveries of striking moment in nature or art. The best he could do was to put on record the impressions of a mind decidedly above the average in the face of scenes visited for the first time, illustrating and vivifying them by such touches of literary skill and taste as his stores of reading brought to his command upon the spot. The lightness of heart which youth, health, and buoyant spirits cannot fail to

* To and from Constantinople. By Hubert E. H. Jerningham. With Illustrations. London: Hurst & Blackett. 1873.

engender in the presence of natural beauty and unusual aspects of life is becomingly tempered by the mood of thought which suggests memories of the past, and finds food for serious reflection in the contrast between things old and new. A vein of sober and improving thought thus runs through the lightest portions of the narrative, and awakens in the reader an interest in the future career of one whose official life has begun so well. The well-being of our diplomatic services must in no slight degree depend upon our having a succession of young men not merely trained to routine, but gifted with original powers of observation and thought; and though what was known as the high school of politics may be a thing of the past, it will be well for our foreign relations if we can point to a reserve of young members of the service who are as ready to observe and think and write upon foreign themes as the author of the volume before us, who is already favourably known by his *Life in a French Chateau*, and his translation of Baron Hübnér's *Sirtus V.*

Mr. Jerningham's Homeric recollections made the approach to Greek waters and shores a succession of bright and suggestive visions, and his geographical studies are called up to give names and associations to each island, rock, and headland. Is this the isle of Calypso (*Καλυψό*), the centre of the sea (*ὁμαλὸς θαλάσσης*) as Delphi was of the earth? He inclines with D'Anville to the belief that Iano is no other than the Homeric Ogygia, rather than Pantellaria or Malta; seeing rightly no great objection in the fact of Ulysses taking twenty-one days to get thence to Corfu, whither steam conveyed our travelling party in not much above half that number of hours. "A darned spot," an unclassical American on board pronounced the rock, "only fit for sharpening a slate-pencil." Reaching the green isle of the old sea-loving Phœnicians, no gentle Nausicaa, his favourite character in history or romance, met our traveller with her charms and winning ways, but only the inevitable commissionaire with his obsequious service to the "Signor Segretario," an appellation which was as yet pleasing from its novelty. Poetical taste led him to look for the river whither Ulysses was directed by Ino (*καλλινοπέδον*), and for the site of old Corcyra, while etymological instincts busied him with the problem, What does Corcyra come from? He seems indeed rather confused here. Schliemann, he says, derives it "from *κορυφή*, the Byzantine form of *Κίρκη*, as it is styled on old coins, referring to the two double-coned hills on which the modern fortress is built." Of course what Schliemann meant was that the modern name Corfu was thence taken. Delighted as the Greeks appear at being in possession of the Ionian Islands, our author questions whether the islanders do not regret their English masters. The trade of the place has declined, while the strength of their so-called key to the Adriatic is such that one Krupp or good-sized Armstrong gun would capture the place in a few hours. Running over in his mind the many masters the island has had during the 2,500 years of its history—having belonged since mythic times to the Corinthians, the Macedonians, the Romans, the Byzantine Greeks, the Normans of the Crusades, the Venetians, the Turks, the French, the English, and the modern Hellenes—he finds in these diversities of rule, not only the cause of a hybrid jargon or a mongrel population, but the source of a bullying roughness or a cunning which is allied to fear, as well as of the ignorance which must naturally result from the impossibility of forming a dialect of their own. There is in this observation, we cannot doubt, the key to much that baffles ordinary explanation in the character of the modern Hellenic people. Passing Ithaca by night, our author could but sigh over the lost opportunity of treading the soil, barren as it now is, once hallowed by the steps of the wandering hero and his patiently loving mate. The day dawning over Navarino brought up political musings of a more recent kind upon the "untoward" action which made those waters famous in our time. Classic memories were again stirred as the steamer crept slowly under Sunium's lofty steep, and mixed with anathemes of Byron as the traveller in view of Salamis stepped on shore at the Piræus. Sadly were these dreams dispelled when a so-called son of Athens tapped him familiarly on the back, to say that facing him was the tomb of Themistocles. To a request for his card, "I am Miltiades," was the reply, with a savage grin, "at your service." "Miltiades a laquis de place!" "I know them all; those poor gentlemen of Marathon." The memory of that unhappy event still weighs upon the public feeling of Athens, and imparts an air of gloom and dulness to the life of the place. Instead of the free and joyous going to and fro of reckless sight-seers, no one can now consider himself in safety who ventures a mile out of Athens by himself. Indeed so timid did Mr. Jerningham find everybody, that a walk up Lycabettus, a hill which is much a part of Athens as the Acropolis itself, was considered to be a rash and an unwise act. The road from Athens to the Piræus was guarded by a mounted patrol day and night. Phalerum had to be given up as a bathing-place, it having been reported to the police that bathers had been watched, and that daily riders to the place had been marked. Athens was in fact, to all intents and purposes, a besieged city, and the only consolation to a classical student was found in the happy thought that he felt as the Athenians did when the Spartans first invaded Attica.

To remain there, however, cooped up with no brighter outlook than this was more than human patience could stand. A trip to the Morea, where the roads were reported to be more secure, was accordingly planned. At the request of Her Majesty's Minister, orders were telegraphed to Nauplia to furnish an escort for a party of three, and no pains were spared to secure their safety during the first trip undertaken in Greece by foreigners since the Marathon catastrophe. Our author is careful to show that

he and his friends were well aware how little sympathy they could expect from their countrymen at home had they, by want of proper precautionary measures, got themselves and the Greek Government into new difficulties. With minds at ease they started for the Piræus one Sunday night in September, embarking on board the *Ὁμόνοια* (*Concord*), amongst a crowd of passengers with varied dresses and a decided prevalence of handsome faces, which seemed to frown upon the strangers as if they were responsible for the gross indignity of insisting that two English lawyers should be present at the Deliasi inquiry. Skirting the picturesque monastery of Calavria, overlooked by the temple of Neptune, where Demosthenes died by his own hands, and the glorious island of Hydra—which carried the mind on from olden to modern times, calling up the patriotic names of Condurliotti, Miaoulis, Tombazi, and Boudouri, and over against which is the village of Kastri (the ancient Hermione, it is thought) one of the mouths of hell, by which Persephone was forcibly carried off thither—the party was welcomed by the Nomarch of Nauplia. Of this place the chief attraction is the strong fortress of Palamede, built by the Venetians upon a site where a classic mind could not but picture Palamede, son of Nauplius, discovering the pretended madness of Ulysses. Our author, it must be said, is even exceptionally qualified for the enjoyment of the romance which centres in spots like these, displaying as he does an apparently implicit belief in the mythological lore which lingers about classic sites, albeit his state of belief belongs to what may be called the pre-scientific period. Although he quotes Smith's Dictionaries, and gives intimations here and there of having tasted the stronger meat of Professor Max Müller and Mr. Cox, he would seem to have been reared more probably upon the milk of Lempière. He thinks nothing of mixing up topographical and historical details of the day with the jealousy of Juno at the flirtations of Jupiter with the fair ones of Argos. It is simple matter of fact with him that Tyrins and Mycenæ were built, the one by Præstus in 1400 B.C., and the other by Perseus a generation later. Yet he has obviously read up a good deal both of modern and earlier history, and has prepared himself with much reading of Pausanias and Strabo, of Colonel Leake and Mr. Finlay, for appreciating and setting forth the points of interest along his route. His trip to Mount Athos, and his description of the many monasteries which crown the hills, or nestle among the defiles, if wanting in the bibliographical learning and scholarly finish of Ourzon, are marked by much point and power of observation. Though feeling somewhat tongue-tied upon questions of current politics, he lays his finger upon the sore spot which threatens the independence and vitality alike of the ecclesiastical and the political action of Greece. We trust it is not likely to compromise the old *Agoumenos* (as our author writes the name), who, with defective notions of things English, showed himself remarkably up in topics of the day, that he desecrated freely to the English attached upon the irrepressible encroachments of Russia, adding that, in his mind, the movement was, historically speaking, very natural. In the same way that nations rise on the ruins of others, so, he said, communities that die are replaced by others. The same reflection was enforced by a conversation with a sagacious old monk at Iveron, who had been a doctor and had seen the world. Stereotyped or petrified forms, decayed morals, intrusion of the Slave element, and the alienation of their lands to Russia, are eating out the heart of the monastic system, and, what is worse, of Church and State throughout the land. In Walpole's eyes these establishments, degraded and out of date as they were, were of value as keeping up the language of Greece, and checking the defection of Christians to Mahometanism. But now a much more dangerous enemy has appeared than ever the Turk was to the Greek, and these institutions are made a lever for inclining the edifice of Greek liberty in a more perilous direction:—

Russia, under the cloak of a common religion, has overrun the old Chalcidica with its monks and its riches, has bought up the lands which an impoverished treasury could no longer maintain, and advised in countries, not under her rule, the confiscation of ecclesiastical property belonging to those of whose support she wished to be assured by their being reduced to poverty.

It is not speaking that which had better be kept back, to give utterance to the only words a traveller can hear from the present monks of Greek origin on Mount Athos.

There is but one cry, one bitter moan, one powerless protest:—

"We are little by little drifting into the power of the rich man. He coaxes and he feeds our wants; but we are caught in his web, and our doom is sealed."

"His monasteries are rich, while ours are poor. His lands increase at our expense; and we feel as if we had pawned to him whatever remains to us, while he knows well that we can never redeem it."

In his remarks upon the contrasts of character between Greeks, Turks, Levantines, and Armenians, partly suggested by his experiences at Stamboul, Galata, Nicomedia, and Nicæa, partly inspired by the witty sallies of M. About, Mr. Jerningham shows much general insight, if not displaying overmuch predilection for any one race over the other. It is to the mixture of so many races, as he implies, that the depression and degradation of the whole is due. Sad to say, it is the Christian element which has lowered the old Osmanli pride in truthfulness and honour, while the sensual and indolent temper of the Turk has given the Frank a preference for easy-going and fraudulent practices over honest and persistent toil. Of the Greeks "outside Greece" our author cannot speak too highly, but these are, as he observes, Greeks no more. The Greek at home is essentially idle, frivolous, ignorant, and vain. All aim at being Ministers of State, and not one will condescend to be apprentice in a workshop.

The great godsend is a change of Ministry, when good things are freely scattered around. No wonder that brigandage is thought the best profession after all, whenever, by the overthrow of their leader, all are thrown upon their wits for a new appointment. Something of the old ancestral kleptarian survives no doubt in the Greek temperament, while the weakness or the corruption of official classes at large serves to take off much from the comparative odium or oppressiveness of the brigand régime. It was not without reason that the Demarch of Argos, a man of intelligence and probity, remarked that the people feared and hated the brigands much less than they did the soldiery. Our author's hopes for the country, for which and for its people he cherishes a genuine love, rest upon the wholesome influence of young Greeks educated abroad, combined with sound measures of internal reform. First among these wants is that which all travellers have recognized, the construction of good roads. By these means alone can the evil of brigandage be effectually checked and finally extirpated. Not only has a wholesome sense of this reality come to dawn upon the more intelligent Greeks, but a feeling of the eye of the world being upon them has been another good result of the catastrophe, to which we further owe Mr. Jerningham's mission and his entertaining book.

CAIRNES'S POLITICAL ESSAYS.*

PROFESSOR CAIRNES has followed up the publication of his essays on Political Economy by publishing a similar collection of Political Essays. We recently expressed our high admiration of the former volume; and the present one is no less remarkable for the qualities of clear statement, sound logic, and candid treatment of opponents which were conspicuous in its predecessor. Although some of the subjects treated by Professor Cairnes have lost their immediate interest, owing to political changes which have taken place since their appearance, none of them, with one exception, can be regarded as altogether obsolete. One, and by no means the least able, of the present articles is a lecture upon the American Revolution, in which Professor Cairnes maintains the doctrine that slavery was the only cause of the Civil War, and that the extension or limitation of slavery was the only point at issue between North and South. The abolition of slavery has removed this question from the sphere of politics to that of history; though, of course, many topics more or less directly connected with it are likely enough to come again before the world. Of Professor Cairnes's treatment of the subject we need only say that it is what might be expected from the author of the remarkable essay on the Slave Power. That book was the most powerful defence of the doctrine of the Republican party which appeared in England during the war; and this essay is little more than a corollary from the propositions laid down in the larger treatise. Another topic treated by Professor Cairnes has also for the moment ceased to excite any eager discussion; but of this it is pretty certain that we are at some time or other destined to hear more. Professor Cairnes discusses the policy of maintaining our Colonial Empire; and he states his argument with equal force and clearness. As in the American discussion, he appears as an ally of Mr. Goldwin Smith, of whose letters on the Empire he speaks in terms of unusually warm admiration. It would be curious to compare the two writers from a purely literary point of view. Each of them adopts pretty much the same line of argument, and each of them has the merit of making his meaning perfectly unmistakable. But where Mr. Goldwin Smith dazzles us by his brilliant epigrams, his keen strokes of satire, and his eloquent enunciation of moral principle, Professor Cairnes avoids all epigrammatic forms of speech; he is never personal, and he seldom enlivens his logical statements by anything like an appeal to sentiment. Which is the better writer is a question which must be answered by inquiring what is the audience to be affected. If Professor Cairnes would hardly make such an impression as a writer of leading articles, his style would perhaps be better adapted to influence the opinion of an impartial court (if such a thing existed) of international arbitrators. In fact, he is eminently a judicial writer; by which, of course, we do not mean to say that his judgments are always correct, but that they are founded on a careful examination of the evidence before him, and are obviously the result of much painstaking reflection. He reminds us, indeed, more than any other living writer of Mr. Mill, as Mr. Mill appeared in his treatises on Logic and on Political Economy. Those books, as we need hardly say, owed a great deal of their influence to the singularly passionless air which pervaded them. Readers who formed their opinion of Mr. Mill exclusively from his writings imagined him to be elevated far above the sphere of popular passion, and were quite astonished when the sensitive and emotional side of his character revealed itself in his later assaults upon the established order of things. We do not know how far Professor Cairnes sympathized with the political sentiments which gave a colour to the last years of Mr. Mill's activity; but this book would be compatible with the opinion that he stands towards Mr. Mill in something of the relation in which Mr. Mill stood to Comte. He accompanies Mr. Mill the logician and the economist; but he does not explicitly avow sympathy with Mr. Mill as the abolisher of sex and the subverter of landed property. Perhaps, indeed, Professor Cairnes would go along with

his leader even in those more extreme theories, and says nothing about them merely because they do not here come in his way. We only mean to imply that the general quality, so to speak, of this writing resembles rather the *Principles of Political Economy* than the *Subjection of Women*. Such writing, calm, impartial, and carefully reasoned, is of no small value at the present day; and we only wish that we could see more of it in the writings both of Radicals and their opponents.

It has indeed one defect, which is common to the master and the disciple. Professor Cairnes's Essays, as an opponent would be apt to think, are too conclusive. They somehow have too strong a resemblance to a mathematical demonstration. Everything works out so smoothly, and the inference is deduced so rigorously from the premises, that he appears to have not only the best of the argument, but the whole of the argument. His opponents are not merely confuted, but it is proved that they never ought to have opposed him at all. There is, in fact, something about his writings which reminds us of that dogmatism of men of science which can on occasion stand a very close comparison with ecclesiastical dogmatism. It is not that Professor Cairnes shows the slightest want of courtesy towards his opponents, or meets them with assertion instead of argument. It is simply that his own views are so neatly rounded off and so excellently supported by evidence at the weak points that we feel that it is almost a condescension in him to argue at all. The persons whom he dares to confute are like schoolboys seriously defending their own blunders against the authority of their master. The master explains to them the source of their error most kindly and clearly; but it is obvious that they scarcely deserve to be reasoned with at all. Now we by no means say that this appearance of logical infallibility is in all cases fallacious. On the contrary, we could point out cases in this book in which Professor Cairnes has, as we believe, not merely the appearance, but the reality, of a conclusive victory. He is a thoroughly clear-headed man, and when he deals with matters (and there are a great many such matters) on which he is fully competent to form an exhaustive opinion, he puts his case in such a way as to be pretty nearly invulnerable. Nobody could confute an economical fallacy, for example, more conclusively. He could point out the weak points in the chain of reasoning and sever it at a single blow with perfect decision. But in some other cases the reader who has been thoroughly confuted is apt to have a feeling that somehow or other the case cannot be so clear as Professor Cairnes has put it. The mere fact that there are reasoning human beings who take the opposite side of the question seems to prove that it cannot be conclusively summed up in so distinct a manner. When one man is absolutely certain that a coin is made of gold, and another equally clear that it is made of copper, there must be some sort of reason for each view of the question. The copper, if it be copper, must be very highly burnished, or the gold, if it be gold, very dirty. Professor Cairnes seems generally to prove, not only that the coin is gold or copper, as the case may be, but that nobody could possibly have mistaken it for anything else. A logician, when he is exposing an error, ought to remember that, for practical purposes at least, his work is only half done when he has shown the nature of the error; he ought also to show how it came to impose upon the world; for the mere fact that it was believed is, in itself, a phenomenon which requires explanation. Thus, for example, to take the question of the Colonial Empire, Professor Cairnes proves the inutilty and emptiness of a home government of the colonies so conclusively from his own point of view that we begin to wonder how anybody can ever wish to maintain such a palpable sham. Now, assuming him to be right in all his statements—an assumption made, of course, purely for the purpose of argument—we begin to feel a certain astonishment at the vitality of the sentiment which he assails. If colonial loyalty and British love of empire are so hopelessly absurd as he has made them out to be, how is it that reasoning men are so much attached to the delusion? Can it possibly be that so hollow a phantom exercises so powerful an influence? We do not say that this is of itself a conclusive objection to Professor Cairnes's argument; nor do we even say that he could not give a perfectly satisfactory answer. We only remark that he has not troubled himself to explain his antagonists' sentiments, and that consequently his antagonists will be apt to think that he has somehow or other omitted an essential element of the question. There is in fact a very common kind of fallacy in political reasoning, which consists in tacitly ignoring a whole series of arguments which belong, so to speak, to a totally different sphere from that in which the controversialist is moving. It may be that the policy of a certain measure is conclusively established from the point of view of a Chancellor of the Exchequer, but that the reasons which would rightly weigh with him are not equally valid with the Secretary for Foreign Affairs; or, again, that whilst you absolutely convince the statist, you would not have so great an influence with a poet. And even in political affairs the imagination requires to be consulted as much as the arithmetical faculty. It must, indeed, be added that, however this may be, the value of the reasoning is by no means destroyed. We express no opinion here as to the merits of Professor Cairnes's theories about our Colonial Empire, considered as an exhaustive statement of the question; but undoubtedly the reasons which he gives are solid reasons, so far as they go, and the statesman who should neglect to give them their due weight, because he chooses to appeal to sentiment of a different order, would be totally inexcusable. All that we mean to urge is that, in many cases, after the tribunal in which Professor Cairnes is so able an advocate has pronounced its decision,

* *Political Essays*. By J. E. Cairnes. London: Macmillan & Co 1873.

the case must admit of an appeal to another, and in most cases to a higher, tribunal.

One argument which Professor Cairnes puts with great force, though it may also be adduced as illustrating our previous remarks, discusses the proper constitution of a national army. Professor Cairnes is, as we have sufficiently shown, a thoroughbred Radical. He accepts for the most part the orthodox doctrines of his school, and would apparently bid farewell to our colonies to-morrow morning with the most perfect complacency. But he is not the less convinced that we ought to have an army capable of rendering the mere thought of an invasion absolutely chimerical, and consequently—for it is a necessary consequence—of acting vigorously on occasion beyond our shores. He attacks the weak parts of our present system, and though his leading doctrines have been more or less embodied in the recent measures of army reform, there is no doubt much in them which still requires attention. But Professor Cairnes is desirous of a more radical change than any which has been yet effected, or which in all probability can be effected for some time to come. He argues with his usual clearness that the Prussian, French, and English systems are in a kind of geometrical progression, so that the faults which distinguish the French from the German distinguish the English from the French, only in an exaggerated degree. The Prussian system, however, is in some respects rather an awkward precedent for an English Radical; not only because anything coming from the country of Bismarck has a slightly suspicious flavour to a believer in popular government, but because the "militarizing" tendencies of the Prussian system may be considered as decidedly discouraging to a lover of peace and industrial progress. Professor Cairnes, therefore, looks further, and finds in Switzerland—the model democracy of Europe—a system which, on his own showing, reconciles the demands of self-defence and of self-government. Indeed, as he admits in a note, his enthusiasm carried him a little too far, and led him to exaggerate the probable efficiency of a system which has not yet undergone the rough test of actual warfare. Here, too, whilst refraining from expressing any opinion as to the merits of the argument generally, we may say that the advocate of a system of universal service in the army may find his case admirably stated by Professor Cairnes. The further question as to the influence of such a system upon the national character is dismissed rather summarily. Professor Cairnes, indeed, notices the obvious arguments which may be alleged on his side. He points out that in the existing state of Europe we must have a sufficiently strong army, whether it is a good or a bad thing in itself to have such an army; he says that the Swiss plan is the only plan practicable; and he adds some reasons for thinking that in a constitutional country the industrial will be too strong for the military tendencies, and that, as the system is better adapted for defence than attack (a doctrine to which the history of the last war gives a rather equivocal confirmation), the danger of encouraging military tendencies is not so great as might be thought. We feel, however, that in this more general question, which certainly does not admit of so decisive an answer, Professor Cairnes is scarcely so much at home as in pointing out the economical advantages of the system which he advocates, and the nature of the organization which would be required. But whatever shortcomings may exist, or may be supposed to exist, in his reasonings, we cannot but feel that, as far as they go, they are excellently put and fully deserve an attentive consideration.

A considerable part of the book is taken up by discussions on the social condition of Ireland, and on the questions connected with the Irish University system. On these topics Professor Cairnes has the advantage of intimate personal knowledge, and probably this, although we have not space to examine it, will be found to be the most permanently valuable part of his book. On the whole, we have great pleasure in recommending it as a singularly able series of discussions, and well deserving the notice of those who oppose, as well as of those who uphold, the views of which he is so excellent an advocate. A collection of essays published at different times during ten or eleven years, and bearing upon many different topics, necessarily gives an imperfect view of the author's opinions, and to this cause are doubtless owing some of the defects, or rather the shortcomings, which we have noticed; but we may at any rate safely say that none of Mr. Mill's many disciples is a worthier representative of the best qualities of their master than Professor Cairnes.

I GO A-FISHING.*

BOOKS on fishing are almost always liked, even by readers who care little for the "gentle art" in itself. One reason for this, we suppose, is that an earnest fisherman makes himself thoroughly familiar with every remote nook and recess of the beautiful landscapes through which his pursuit leads him; so that, if he be a man of taste and feeling, what Wordsworth calls "the witchery of the soft blue sky" and other kindred influences become a part of his own nature. Hence his descriptions of scenery have a freshness about them, drawn as it were from the early dawn and the opening spring-time, that comes home to all classes of men. In this respect Mr. Prime does not fall behind those older writers to whom we have been referring; nay, indeed, if we have a fault to

find with him, it is that he outstrikes them in trampling seven-leagued boots, suitable no doubt to America, that country of sonorous eloquence and enormous rivers, but a little over-loud and over-big for our reticent British temper and fordable trout streams. The book, though it pleases us, would have pleased us still better if it had contained fewer grandiose emotions and more fish. At the same time Mr. Prime, we dare say, knows pretty well, both as a fisherman and an author, what he is about. He catches American trout with the scarlet ibis, his favourite and successful fly, in places where an English angler would keep uselessly thrashing the water with grey drake and turkey's wing; so let us hope, by analogy, that his *purpurei pennis* may ensnare a crowd of American readers, though we Englishmen are not particularly taken by them. As far as we are concerned, the very first chapter of all, "How Peter Went a-Fishing," is a superfluity and a nuisance. Passages of this description abound:—

Perhaps the full moon was rising over the desolate hills of the Gadarene, marking the silver pathway of the Lord across the Holy Sea; the stars that had glorified His birth in the Bethlehem cavern, that had shone on the garden agony, and on the garden tomb, were shining perhaps on the hillside that had been sanctified by His footsteps. The young daughter of Jairus looked from her casement in Capernaum on the silver lake, and remembered the solemn grandeur of that brow which now they told her had been torn with thorns.

This sort of thing only irritates without impressing us. Again, further on, the following rhapsody about the misbehaviour of the day is not to our taste:—

They [the mountain tops] were joyous then, for day came pure and white and stainless; they are sombre and gloomy and profoundly sad in the evening when they see day going down in the West, her face red with passion or flushed with wine. For, oh! man, never went day to rest unstained, never was morning born so pure, that she retained herself in purity till the setting of the sun. Never yet came daughter of the East, with chariot wheels of silver, a fair and noble maiden worth love, and winning love, that she did not go away in clouds with tenn garments or in blushing shame.

The writing of this kind of stuff is "as easy as lying," and at best only fills up space which had much better have been reserved for the trout, if trout there be, or other fishes in the Sea of Tiberias. We should like to hear a great deal more of that Lake of Genesareth, and Mr. Prime's apparent determination to tell us nothing is somewhat provoking. He has, it seems, fished in many countries—in Syria, in Scotland, in Bavaria, in South America—besides his native waters; but he never will leave the *Salmo fontinalis*, or North American brook trout, for a moment. In Sir Humphry Davy's *Salmonia*, the first chapter exhausts the subject of river trout; the second explains to us all about sea trout and salmon; in the third he devotes himself to grayling; in the fourth we are introduced to the *Salmo hucho* of the Bavarian lakes, and we are taught everything about these different fishes that a short treatise can teach. But Mr. Prime, whether he is at the Kookeries (chapter ii.), or on the St. Regis waters (chapters vii. and viii.), or travelling along the Connecticut streams, &c. (chapters ix. and x.), or elsewhere, confines himself wholly to the *Salmo fontinalis*, so that even that beautiful creature becomes in the end not a little wearisome and monotonous. We should have been glad to hear something of the American Lake trout; how far they agree with, and how far they differ from, the *Salmo fario* of the Lago di Garda, or whether they approach more nearly to the *Salmo ferax* of Loch Awe and Loch Shin. Again, as we have said above, any fishing adventure on the Sea of Tiberias would have been full of interest to all men, whether anglers or not; but we are told this, and this only, that Mr. Prime did, to use his own words, wet a line there. The 153 great fishes under which the net brake may have been large lake trout, or huge carp, or heavy pike. Mr. Prime leaves us uninstructed. About salmon-fishing in America, about the black bass, about the *Coregonus albus* or white fish, he is equally uncommunicative. Two-fifths of his book are appropriated to the American brook trout, and we do not greatly grudge them this; but the other three-fifths might surely, from a fishing point of view, have been better occupied. They are full to overflowing of noble enthusiasm and yearning aspirations, but, to use a metaphor drawn from Mr. Prime's own art, it would have been all the better if some of those had been thrown back again into the waters whence they came. The third chapter, for instance, abandoning trout altogether, is called "Iskander Effendi," and contains a sensational story. An American Jew finds at Jerusalem a mysterious brother, of whose existence he had never known; this brother has somehow or other become a Jew, and is also married to the New York young lady whom our Jew friend has adored in silence from boyhood. We hardly know whether the complications that ensue are represented as having really happened or not. The story is told well enough, and, as a true story, may not be more absurd than certain other romances angrily believed in from time to time by many respectable men; but it has nothing to do with the subject of the book, and appears to us out of place. If, on the other hand, it is a tale of Mr. Prime's own invention, the improbabilities are much too glaring to make it successful as a work of art.

All that part of the book, however, which relates to Mr. Prime's fishing expeditions is very pleasant reading, increasing our regret that he does not give us more of them. The *Salmo fontinalis*, a most captivating fish, which Mr. Buckland is endeavouring to introduce into England, is found everywhere, and everywhere is dwelt upon with zealous affection. This *Salmo fontinalis* appears to be a fish of about the same size as our common trout—certainly, at least as known to Mr. Prime, not larger. At this we are somewhat sur-

* *I Go a-Fishing.* By W. C. Prime. London: Sampson Low & Co. 1873.

prised. The Susquehanna, the Potomac, and countless American rivers of the second rank must be so much broader and deeper, not to mention also being much nearer a state of nature, than the Thames, the Severn, or any other of our British trout streams, that we should have expected them to contain very heavy fish. And yet the heaviest trout recorded by Mr. Prime hardly equals a first-class Thames trout in weight, and does not approach a monster exhibited at Driffield in Yorkshire, for which 17 lbs. were claimed. How these American salmonidæ differ specifically from our common river trout we do not know, and should have been glad to learn. But Mr. Prime does not touch upon the subject. He contrives, however, to make us sympathize with the spotted object of his affections, and when he gives his Pegasus a pull instead of spurring him, and when he recklessly over hedge and ditch, he is often very happy in his descriptions of natural scenery. We extract his account of a night spent by the side of an American lake. Our readers may like to compare it with Tom Brown's well-known vigil, in the hopes of catching a poacher on the banks of his Berkshire rivulet:—

So I went up to the head of the lake, where a brook comes in, over a white gravel bed, pure and clear and cold, and lying down on the beach in the soft sunshine, dreamed away the day; the night came on us with clouds, and the sounds of wind in the higher forests on the mountain sides. We made the camp fire broad and high. Vast pine and birch logs, ten feet long and two feet thick, which with great labour Hiram had cut and rolled together, blazed high on the edge of the forest, and poured a rich light upon the lake. Far out on the water I could see, now and then, the dip and lift of a lily-pad, gleaming like a ruby. The Baron had been out sketching, but had come in at dusk, hung his sketches here and there upon the trees, and as we both had good appetites, we dined sumptuously. Then we talked by the camp-fire for a time, and then he threw himself down on the Balsam boughs, under the bark shelter, and slept in peace.

Both Sir Humphry Davy and Mr. Prime grapple with the question of cruelty as connected with sporting. They do not manage—perhaps it is impossible to manage—this matter with perfect success. Both of them waste time in defending positions that are never attacked nor even menaced. Sir Humphry says, "We are not Pythagoreans or Brahmins," and so on. Mr. Prime continues this obvious line of argument, and urges, in addition, that he would be justified in sacrificing the life of a favourite horse if a higher duty called upon him to do so. No doubt, but upon such points the question never arises. What their antagonist may say is this:—"I like mutton as well as any one, and know that sheep must be killed; but then I let them be killed as a matter of business, and never think of taking a morning's pleasuring as an amateur butcher." Mr. Prime's argument from the possible sacrifice of his horse does not apply, unless he considers himself justified in feeling delight when he digs the spurs in, and gloats over every pulsation of the exhausted animal's heart as it thumps against his ribs. Sir Humphry, indeed, rather shirks the direct argument, and shelters himself behind eminent practitioners of his art—notably, Wordsworth, and some lovely maiden, the cynosure of Mayfair, who was a zealous and efficient angleress. Here the case of this charming Lady Clementina Twoshoes, though crushing as an *argumentum ad hominem* (*Britannicum*), is a little too vague for general use; whilst, as for Wordsworth, great man as he was, we cannot trust implicitly to his guidance through the labyrinth of minor morals; if we do, we may find ourselves on a hill-side stealing woodcocks some dark night. *Vide* Prelude, Book I:—

Sometimes it befell,
In these night-wanderings, that a strong desire
O'powered my better reason, and the bird
That was the captive of another's toil
Became my prey.

We know now, of course, that this thievish impulse was, with other half-divine impulses, gradually building up his mighty mind to its appointed height; but still, if meaner men undertook to educate themselves in that particular way, it would hardly, as the phrase goes, tend to edification. Wordsworth moreover is not consistent with himself on this point. If "Hartleap Well" has any ethical meaning at all, it is meant to discourage field sports; and even the Lord of Rydal himself, fond as he was of reciting his own verses, would hardly have ventured to quote the last stanza of that poem whilst he was gaffing a salmon:—

One lesson, shepherd, let us both divide,
Taught both by what she [nature] shows and what conceals,
Never to blend our pleasure and our pride
With sorrow of the meanest thing that feels.

We must confess that the question is an awkward one to face. We may perhaps, however, say that, as it signifies little to creatures lawfully killed how they die, it is not unfair to balance the good effects of sporting against those which are less good, and decide for or against it accordingly. Now effeminate vanity like Nero's, selfish personal cowardice such as Robespierre's, are the passions that generate cruelty in its basest and most unrelenting form. Against these vile passions, a masculine life nourished upon robust interests, such as war and the chase, is one of the best antidotes known to us. Patience under disappointment, uncomplaining endurance of hardships, self-control, command of temper, resource in difficulties, and other valuable qualities of a like kind are gradually formed by the help of such a life; and, what is more to the purpose, those who follow these adventurous and enterprising pursuits are often the gentlest and tenderest of men. We do not say that these considerations are what Shelley somewhere calls "refutation-tight"; they will not be so accepted, we know, by thoroughgoing humanitarians, such as a certain distinguished historian and philologist, who cannot bear that any living creature

should be put to pain, except indeed an inaccurate Dean or so, and others with him who, hardy rebels against the truth, "greatly daring dine" under the shadow of a mediæval tradition without any root to it. But to such partisans we do not address ourselves, and our view may perhaps suffice for the ordinary conscience of an ordinary Christian and eater of beef, especially if he happens to be fond of fishing.

We have spoken our opinion freely about the exaggerated emphasis of Mr. Prime's style and sentiments. Nevertheless we shall be glad to meet with him again.

GOUDSMIT'S ROMAN LAW.*

THE production in an English form of a Continental treatise on Roman law, written in a technical language for the most part unfamiliar to the English lawyer, and accompanied with hardly any explanation or addition on the part of the translator, shows an expectation which we hope may be well founded, but which in a commercial point of view at least seems daring, of the interest likely to be taken in the subject by English readers. It is true that the importance of Roman law as an instrument of legal education is much more definitely recognized now than it was formerly; perhaps we may safely say it is generally admitted that an educated English lawyer ought to have some knowledge of its leading outlines. It does not follow, however, that the form in which it is presented to Continental students will be also the most convenient for English students, who approach it from a different point of view and for different purposes. Let us consider shortly what those purposes are. At present there exists no such thing as a tolerably good general introduction to the laws of England. We have abundance of sufficiently good books, and some few exceedingly good books, on special departments of the law; but in the way of institutional treatises we still have nothing better than the various editions of Blackstone, which either are content to follow the almost ludicrously wrong arrangement of the original, or patch it up by very imperfect improvements. In the most esteemed of these editions we find the notions of ownership and contract so hopelessly entangled that no place is found for the law of contracts except by dragging them in as a mode "in which that important kind of chattel called a *chose in action* is created"; and we have to look for Lunacy partly under the Royal Prerogative and partly under Public Social Economy; and while this is so, it is obvious that we are still far enough from anything calculated to assist a beginner to any clear or systematic notions. And for the present there seems to be no better way for a student to acquire such notions than the roundabout one of going to another system—namely, the Roman—in which the leading principles are accessible in a definite and compendious form, fixing those principles in the mind, and then bringing the light thus gained to bear on the richer but less ordered treasures of the English books. The main object therefore is not so much to know how far the law as it stood in Justinian's days has survived as the modern common law of the Continent of Europe, nor to be familiar with the classification and terminology of modern Continental writers, as to grasp the main points of the Roman law which are most useful to illustrate the English law by comparison or contrast. And this, we think, is best attained if we begin as near the beginning as possible, with Gaius; of course not wholly unassisted, for Gaius "without note or comment" would scarcely be edifying even to a scholar sufficiently versed in the Latin of general literature. But there is competent guidance to be had in German, and, since the appearance of Mr. Poste's Commentary, also in English. Justinian's Institutes should be taken as near as may be concurrently with Gaius, to whom however we give the first place. The historical elements in the development of Roman law clearly brought out by him, but dropped out or slurred over in the later Institutes, frequently present the most striking and instructive analogies to an Englishman.

The treatises generically known as Pandects, of which the present book is a specimen, have also considerable interest for us, but of a somewhat different kind. We are less struck with the substance than with the method; we cannot help marking that the body of substantive law they deal with is both parallel to and different from our own in many important ways; but that which chiefly fixes our attention is a scheme of treatment and procedure quite unlike anything we have met with in our own legal education. The classification of civil law in its main branches of Ownership, Personal Duties (Obligations), Family Relations, and Succession, which is generally recognized by Continental writers, is not wholly without recognition, though for the most part of a partial and confused kind, in England. But the previous treatment in a General Part, as it is called, of the work, of such principles as are in great measure presupposed by or common to all the special departments of law, has never even been attempted, so far as we know, by any of our text-writers. Certainly the English law student has practically to go without any such introduction. He is plunged at once into special details, whether he begins with reading books or working in chambers; and he must rely on the light of nature and the gradual piecing out of his knowledge to teach him sooner or later which of the

* *The Pandects: a Treatise upon the Roman Law and upon its Connection with Modern Legislation.* By J. E. Goudmit, LL.D., Professor of Jurisprudence in the University of Leyden. Translated from the Dutch by R. De Tracy Gould, M.A., Counsellor at-Law. London: Longmans & Co. 1873.

rules he becomes acquainted with extend beyond the special subject in which they first occur. He may ultimately reduce his knowledge to some kind of order if he chooses to go somewhat out of his obvious way, and take some trouble for the purpose; otherwise it may remain a chaos, and he may never even discover that it is a chaos. Perhaps this is one reason why it is so rare to find any elementary legal notion tolerably well defined in our text-books. As to the remedy, we are not much disposed to look for it in the construction of any system of abstract jurisprudence. Practically all the materials we have for a scientific view of law are either Roman or English; and it appears to us that any one who professes in England to lay down universal principles of law will really expound principles which are Roman, or English, or both, and that he will only weaken his exposition by disguising their individual character from his readers and himself.

Until our own law is presented to learners in a more systematic form—a result which there is no doubt that we can accomplish if we once determine that it is worth while to substitute scientific method for rule of thumb—foreign books such as this of Professor Goudamiit may serve as a very useful corrective. Some warning should be given, however, in introducing such a work to the English public, that it is not suited for beginners. It does not formally pre-suppose any acquaintance with Roman law; but it is not, in fact, meant to be taken as the first part of the course in its own country. The manner of treatment is too condensed and technical for a reader who has not had some little preparation; and the technical vocabulary is just so different from our own that on the one hand it presents some of the difficulty of a strange tongue, and on the other hand care has to be taken to avoid confusion. Subject to these cautions, an Englishman will find in this treatise a satisfactory introduction to the Continental method of legal exposition; though we can hardly concur in the translator's sanguine opinion that it is calculated to interest general readers as well as students of law. As to the individual merits of Professor Goudamiit's *Pandects*, it would be impossible to give any sufficient account of them in this place. Indeed, they must depend in great measure on an exactness in details which cannot be rightly tested except by the continued trial of actually working with the book. However, as far as we can judge without having applied this test, the author has handled his subject with care and accuracy. The text is clear, and the notes show that the authorities have been searched, compared, and weighed. In particular Savigny's great work is constantly referred to with the respect due to it, though the writer exercises an independent judgment, not unfrequently expressing a different opinion on points of detail, and sometimes even on historical questions of the kind in which Savigny is pre-eminent.

We need hardly observe that such English readers as are scholars of Bentham and Austin will not be satisfied with this more than with any other Continental book of jurisprudence. As Sir II. Maine remarks in his *Village Communities*, Bentham's analysis is still very little recognized out of England. In Bentham's view (much insisted upon and developed since by Austin), command is the essence of law, and the uniformity of conduct intended to be its consequence is but an incident. Here, on the contrary, we find uniformity put forward as the main element; uniformity of action resulting from universal (or rather collective) conviction, which conviction finds one mode of expression, but not necessarily the only mode, in the commands issued by the supreme authority of the State. Accordingly customary law is recognized as having an independent force of its own, and no resort is had to Bentham's fiction of quasi-command; for such it certainly is, notwithstanding Bentham's abhorrence of fictions in general. On this point, too, it is curious to note an opposition to the Benthamite way of regarding law and legal history; Professor Goudamiit speaks with decided approval of the free use of fictions in English law, and wishes they could "move a little more in the region of legal fictions" in Holland.

The translator's part of the work has been done, as appears by an extract of a letter from the author, so as to deserve his warm commendation; but we think that hardly enough has been done to meet the difficulties of English readers. Probably the translator, having familiarized himself with the technical vocabulary, did not see that it might require some explanation for others. Thus we find the phrase "relations of Right" obviously standing for the Dutch equivalent of *Rechtsverhältnissen*; to any one not acquainted with the use of the term *Rechtsverhältnissen*, which has no parallel in the language of English law, this would convey no adequate meaning. Either such terms should be explained by a foot-note when they first occur, or, still better, conventional English equivalents should be assigned once for all to represent the foreign words of art, the specialized senses in which the English words are used being carefully defined at the outset in a sort of interpretation clause. And something more might easily have been done in the way of calling attention to parallels and contrasts in English law. Several years ago one of the present leaders of the Equity Bar published a translation of Thibaut's *Pandektenrecht*, a book similar in character to this, accompanied by a valuable series of notes on the corresponding principles of our own jurisprudence. In the present instance the translator has only thrown in some very meagre notes almost at random. For instance, he gives some remarks on marital authority, legitimacy, and inheritance; but when, in a neighbouring page, Professor Goudamiit mentions among "examples of complex relationships," as a Dutch professor well enough may, the case of A. marrying B. and afterwards her sister C., the translator does not think it needful to call attention to

the fact that this particular source of complex relationships is not recognized by the law of England. Again, the translator appears to be an American by his designation on the title-page and by the internal evidence of his notes; but he has given no explanation of an apparently loose expression of the original in a passage where it is said vaguely that a rule of law exists "in the United States," making persons liable as subscribers to a newspaper though they have never ordered it, if the publisher sends it to them and they receive it without protest for a certain time. It is curious that an American editor should leave this unnoticed. It may be common knowledge to him, but English readers would like to know more of this new variety of implied contract; when it was established, and in which of the States. It strikes us as being neither good sense nor good law; however, it appears from an advertisement at the head of an American newspaper which happens to be before us, that such is the law at Boston and Chicago at all events.

Finally, we must observe that the promise of the title-page as to the "connexion with modern legislation" of the Roman law is but very moderately fulfilled. There are indeed plenty of references to the French and Dutch, and many to the Austrian and Prussian Codes. But the discussion of modern Continental law is kept in a quite subordinate position, and there is nowhere any continuous historical treatment of the matter.

HEMANS'S MEDIEVAL CHRISTIANITY.*

THERE is one difference between the present volume and the preceding one for which Mr. Hemans's readers have much reason to be thankful. It is printed in England, and therefore naturally on decent paper, and with comparative freedom from errata. We say comparative freedom, for such spellings as "chace" for chase, and "absolution" for absolutism, to say nothing of barbarisms like "contendants" and "votation," still betray a lamentable negligence either in the printing or the correction of the press. Nor can we say that in point of style and arrangement there is the improvement that might have been looked for. Mr. Hemans does indeed, for the first time, vouchsafe to give us a table of contents, but it consists of the barest catalogue of the titles of each chapter, such as "The Fourteenth Century, 1350 to 1400;" and the inconvenience of the omission is not relieved by any running titles beyond that of the volume at the head of each page. The narrative is, however, somewhat less disjointed and jerky, from the fact of the author having confined himself here to a shorter period (1350–1500), and having described it more fully, and, for the most part, in chronological order, following the reigns of the successive Popes. Another defect which we took occasion to notice in the earlier portion of his work is only very partially remedied. We mean the neglect or reluctance to profess any opinion on disputed historical questions. Thus, for instance, the name of the Waldensian sect is said to be derived "by some writers from Peter Waldo, by others from *valle* or *Vaudois*." We are told of Urban II.—the last Pope who had not been previously a Cardinal—that "one chronicler of the time denounces him as a cruel, scandalous, and very bad man," and certainly Mr. Hemans has himself told us enough to prove abundantly the charge of cruelty; "but," he proceeds, "the Florentine historian Ammirato undertakes to justify him on the ground of manifest necessity for severe measures amidst the then embarrassing circumstances of the pontificate." And there he leaves the matter. Are we meant to suppose that the imprisonment and systematic torturing of several of the Cardinals for crimes of which they appear to have been innocent, ending with their being privately strangled or drowned by the Pope's order, was "a manifest necessity?" or that the facts which have just been detailed, without any hint of uncertainty, are perhaps incorrectly reported? Again, we have three different lists given of the numbers of prelates and other ecclesiastics present at the Council of Pisa, without any attempt to discriminate their respective claims to accuracy. We presume, by the by, that in enumerating the members of the Council of Constance, "1,134 abbots" is a misprint for 134, which was the real number. It is fair, however, to say that on some controverted points Mr. Hemans does pronounce a verdict, as on the much vexed question of the character of John XXIII. We believe he is quite right in following the opinion maintained by the learned Hefele in the last volume of his *Concilien Geschichte*, that the more serious charges against the unfortunate pontiff cannot be proved; and though he may have been "the very personification of worldliness," there is no reason to suppose he was much better or much worse, but only much abler, than the general average of dignified Churchmen of his day. The author has also rightly, but perhaps unconsciously, followed Hefele on the question of the safe-conduct of John Hus, as well as in the spelling of his name, and has wrongly followed him in the assertion, for which he gives no authority, that the famous decree of the Fourth Session of Constance on the superiority of Councils to Popes was not included in the Bull of Martin V., sanctioning all the "conciliar" acts of the Synod. This mistake is the more puzzling as he afterwards mentions that the doctrine was admitted and acted upon at Basle, where also the decree of Constance was expressly confirmed, and its confirmation ratified by Eugenius IV. On the whole the author's account of the Council of Constance, which, being held out of Italy, does not properly fall within the limits of his work, is clear and accurate. It is odd

* *History of Medieval Christianity and Sacred Art in Italy (1350–1500)*. By C. J. Hemans. Vol. II. Williams & Norgate.

to find him gravely retelling the exploded legend of the martyrdom of St. John Nepomuck, without apparently a doubt of its truth.

To general readers the earlier chapters of the volume, which include the second half of the Avignon period and the episode of Rienzi—or, as Mr. Hemans, for some unexplained reason, always calls him, Rienzo—will probably be the most interesting, though his record of the career of the great Tribune is too brief and sketchy to be satisfactory. Most of the Popes of that period were at least outwardly respectable in their personal conduct; but both Urban VI. and Boniface IX. were unblushing nepotists; and there is a characteristic anecdote preserved of the deathbed of the latter, who, when asked how he felt, replied, "I should be quite well if I had money." A contemporary chronicler tells us that among the bishops appointed by him, always for a money payment, were *scurre, histriones aut discoli*, of the most scandalous antecedents. Nor were the fourteenth-century Popes more scrupulous about usurping patronage which did not belong to them than about selling it when it came into their hands. Clement VI. in 1341 quietly transferred to himself by a bull the right of appointing to the see of Florence, which had been up to that time the immemorial privilege of the chapter. To turn to a different subject, Mr. Hemans gives a curious description of the pilgrimage of the "White Penitents" at the end of the century, which almost reminds us of the first fervour of the Crusading movement, when crowds of men, women, and even children, straggled across the length and breadth of Europe, too many of them only to perish miserably on the road:—

The sense of sin and misery, compunction for the first and pity for the second of those universal ills, may be said to have predominated throughout the middle ages. It was not till comparatively modern times that the dignity and self-responsibility of man began to possess his thoughts. In the last year of this century the feeling of profound sorrow for sin found vent in a movement which aroused the attention of the Christian world, and extended over almost the whole of Western Europe. The "White Penitents" commenced their doleful pilgrimage from land to land, from city to city, joined by multitudes of both sexes and all classes, clad in long white habits with hoods covering the face so as to leave the eyes only visible; the women distinguished by a red cross; all, as they advanced, reciting or singing orisons and hymns—the *Stabat Mater*, the *Miserere* psalm, &c. According to some writers, this movement originated in Ireland; thence passed, to England; thence through France, crossing Alps and Apennines, and spreading with mournful enthusiasm over Northern and Central Italy. At Genoa 5,000 arrived in such guise, and were led by the aged Archbishop, himself on horseback, to visit churches, cemeteries, shrines, during nine days. From Lucca 3,000 set out, notwithstanding the veto of the magistrates, for Pistoja, where they were joined by 4,000 more, and thence passed on through Prato to Florence. There the devout multitude swelled to 40,000; and as many as 20,000 were led, in one long-drawn procession, by the Bishop of Fiesole to visit the holy places. At Parma the pilgrims on foot were followed by forty cars, containing the infirm and feeble, women and children. From thence 7,000 set out, preceded by pious confraternities with their standards and led by the Bishop of that diocese. At Venice the authorities refused to admit them; but at Ferrara the Marquis d'Este treated them with honour. Whatever the fanaticism of this "revival," it is certain that the fruits of good works, aims to the poor, reconciliation of enemies, restitution of what had been unlawfully taken, were abundantly borne by it.

The Mysteries and Miracle Plays, already popular in the twelfth century, were now beginning gradually to merge into dramatic and epic poetry, and the *Quadriregio* of the Dominican Frezzi, who died in 1416, passed through six editions between 1481 and 1511. Considering its date, it is remarkable that we find unbaptized infants and virtuous Pagans enjoying "an immortality of negative happiness" in the Elysian Fields and Limbus, which are, however, regarded as part of the infernal regions. Boccaccio's famous story of the converted Jew at Rome who concluded that Christianity must be true because the Court of Rome and the Cardinals had been unable to destroy it affords a striking illustration of the prevalent estimate of the Curia; while the reverse of the picture is exhibited in the strange austerities and still stranger influence of St. Catherine of Siena and St. Bridget, who denounced the vices of Popes and Cardinals in language which Luther could hardly exceed, but were canonized instead of being excommunicated.

Mr. Hemans's pages abundantly illustrate the deteriorating effect of absolute and irresponsible power on the character of the Popes, so often remarked upon, and of which Marcellus II. is recorded to have expressed his fear in his own case, though he died too soon after his election for such fears to be realized. Urban II., whose cruelty and nepotism have already been referred to—he actually screened from punishment one of his nephews, whom he had already made a duke, who carried off a nun from her convent and violated her—was before his election a man of modest, austere, and studious life. The antecedents of Martin V., who to the last studiously evaded his engagement to carry out the reforms of the Council of Constance, which had elected him on that condition, were "not only respectable, but admirable." The previous life of Eugenius IV. had been saintly, but throughout his pontificate his great aim was to advance his own prerogative and the interests of the Roman Curia. "Had he made a better use of his talents," says the Benedictine author of the *Art de vérifier les Dates*, "he might have restored to the Church part at least of her pristine splendour." The Cardinal presiding at the Council of Basle observed, in reference to these growing encroachments of the Papacy, "What are Bishops now but a set of shadows? What is left them but a pastoral staff and a mitre? Can they be called shepherds, without sheep, and unable to do anything for those under them?" The words sound almost like a prophecy of the Vatican Council. By the way Mr. Hemans

commits the unpardonable blunder of quoting the famous definition of the Roman Primacy in the Florentine decree of union, without the qualifying clause about the authority of Councils, on which its whole sense depends. Eugenius died exclaiming "O Gabriel, how much better had it been for thy soul's salvation to have been neither Pope nor Cardinal, but to have died a simple monk!" Not less significant is the complaint of his excellent successor Nicholas V., by far the grandest figure among the Popes of that century, the founder of the Vatican Library, and the energetic patron of the best learning of the day, both sacred and profane, who reclaimed for the Papacy its intellectual primacy in Europe, and with a noble liberality laboured to the utmost to save the Christian East from the irruption of Mahometanism. The news of the fall of Constantinople shortened his own days. But, little as he had to reproach himself with, he bitterly complained to the two Carthusian monks whom he kept constantly about his person "that there was no man on earth more unhappy than the Sovereign of the Church," to whom none that crossed his threshold ever dared to utter the plain unvarnished truth; and he added with tears "that he would gladly renounce the pontificate." The accomplished and outspoken Æneas Silvius retracted as Pius II. all he had formerly maintained about the superiority of Councils to Popes. Whether he also explicitly retracted his earlier dictum that "there was great reason formerly to forbid the marriage of the clergy, but there is now still greater reason to permit it," does not appear. His personal character was irreproachable, which may be said, on the whole, of his immediate successor Paul II., but certainly not of the Popes who followed him to the end of the century. Sixtus IV. set the example of creating new offices for the express purpose of selling them, besides making those venal which had not been sold before. His reign did much to dispel the last illusions of childlike veneration for the Papacy, as may be inferred from the words of a contemporary Latin poem on the Calumnies of the Times:—

Venilia nobis
Templa, sacerdotes, altaria, templa, coronas,
Ignes, tura, preces, celum est venale Deusque.

Innocent VIII., who succeeded him, gave fêtes at the Vatican at which a son and daughter of his own took a prominent part, and publicly celebrated the weddings of his own children. The infamous Alexander VI., whose election to the Papacy was notoriously simoniacal, went still further when he expressly named his daughter, the fair Lucrezia, as his vicar; during his absence from Rome she presided and gave audience in the Papal apartments, with a Cardinal as her subordinate seated at her side.

Mr. Hemans has only partially completed his record of Sacred Art in Italy during the fifteenth century, to which he proposes to devote a supplementary volume. In architecture the later half of the fourteenth century was the period of the commencement of the magnificent Duomo of Milan and Certosa of Pavia, both founded—perhaps as an act of penance for his horrible cruelties—by Gian Galeazzo, Duke of Milan, but the Certosa was not finished till a century later. No fewer than fifty-two architects were employed on the Duomo. The Cathedral of Florence was completed in 1364. Several other Italian cathedrals, as those of Prato, Como, Fermo, and Orvieto, were built or rebuilt during the same period. In painting it was the era of Bellini, Sandro Botticelli, Ghirlandajo, Pietro Vanucci, Filippino Lippi, Perugino, and Fra Angelico, not to mention other well known, if less memorable, names. The chapters on the artistic monuments belonging to this period in Rome and the principal Italian cities are arranged too much like a guide-book to be exactly attractive reading, but will be found most serviceable by those who are visiting the places. Mr. Hemans has devoted many years to studying Italian art on the spot, and he brings to bear on his detailed descriptions the results as well of a minute knowledge as of a refined and cultivated taste.

BIRCH'S ANCIENT POTTERY.

WE heartily congratulate Dr. Birch on the appearance of this sumptuous new edition, so profusely illustrated, of his *History of Ancient Pottery*. The book in its original form, published sixteen years ago, was already a monument of learning and industry. This revised edition seems to leave very little indeed to be desired. It is an exhaustive treatment of the whole subject, and future inquirers can scarcely make any additions to the stock of knowledge here accumulated. In natural science there will always be much to learn and much to be discovered, which may probably modify, if not contradict, existing theories. In some branches of archaeology, and notably in the history of the ceramic art, it is otherwise. Dr. Birch enlarges on this in his sensible preface to this new edition. He claims credit for bringing before his readers the whole field of possible inquiry as to ancient pottery. He reminds us that the bringing to light of any number of fresh examples by new excavations is not likely to add much, if anything, to our existing knowledge. For the classes and divisions of the ceramic wares of antiquity have long been finally determined. There are only certain criteria by which the age of any specimen can be estimated—the fabric, the character of contemporary art, the language used in any inscriptions, and the science of palæography in deciphering such inscriptions. It is in

* *History of Ancient Pottery; Egyptian, Assyrian, Greek, Etruscan, and Roman.* By Samuel Birch, LL.D., F.S.A., &c. New and Revised Edition, with Coloured Plates and Woodcuts. London: Murray. 1873.

the last of these that modern archaeological research has won the greatest successes. Not much remains to be done even by an improved philology in respect of the inscribed pottery of ancient Greece and Rome. But Dr. Birch looks hopefully to possible new discoveries in the archaeology of Central Asia and of "civilized Africa." So far as concerns the potter's art in the primitive and prehistoric races of man, during ages in which the art of writing did not exist, and in which there seems to be no possible link of connexion between the rude arts practised and the languages spoken by the men who used them, nothing more is to be looked for. "Here," says Dr. Birch, "the question of the relative date of the pottery can only be solved by the conditions under which it is found, and the remains with which it is associated." This, of course, is true. It is with a pardonable pride in his subject that our author claims for the potter's art so great and universal an importance that a knowledge of it becomes essential for any adequate understanding of the mythology, history, and arts of all the families of mankind.

The work before us divides the whole subject of ancient pottery into five parts. The first treats of Egyptian and Oriental ceramic products; and then Greek, Etruscan, and Roman fictile art follow in order; the final section dealing with Celtic, Teutonic, and Scandinavian pottery collectively. With the advantage of innumerable illustrations Dr. Birch's pages are made as interesting as they are instructive. Without drawings, indeed, it would be difficult, if not impossible, to convey adequate notions of the forms and details of the articles described. But in these pages an appeal is made to the eye as well as to the mind. Take, for instance, the most interesting reproduction of the picture of Egyptian brick-making which is found in the tomb of Rekmara, an officer of the court of Thothmes III., of the eighteenth Egyptian dynasty, about 1400 B.C. Here are seen Asiatic captives, under the superintendence of taskmasters armed with sticks, labouring to mix with hoes the clay or mud to a proper consistency, while some bring water from a tank, and others carry the kneaded clay to those whose duty it is to stamp it with a mould into bricks of the required shape, which are then laid out to be dried in the sun. These were, of course, unbaked bricks. A great step was made in advance when it was discovered, whether accidentally or otherwise, that the clay might be made by baking practically indestructible. And then the addition of vitreous glazing or enamelling, and the invention of the "potter's wheel," brought the art to a much higher level. A picture is given from the paintings of a tomb at Beni-Hassan, in which all these processes are most carefully represented. Dr. Birch remarks certain specific differences from the Egyptian pottery in that of Assyria and Babylonia. The latter is finer in its paste, brighter in its colour, and thinner in mass than the former. Of ancient Phœnician pottery very little indeed is known. Is it not probable that further researches may throw light on this particular branch of the subject? We do not observe that Dr. Birch makes any reference in this section to any results obtained by the Palestine Exploration Expedition. He reminds us that a guild of potters existed at Jerusalem, and that one of the gates of the Holy City was named after them. He imagines that the Jews, among whom he considers that the state of art was very low, obtained the greater part of their earthenware from Egypt. What pottery is usually found in Palestine is of the red Roman, or so-called Samian, ware, of a comparatively late period. We approach an infinitely more interesting branch of the subject, in an artistic point of view, when we leave the pottery of the Asiatic nations, and come to examine that of the ancient Greeks.

We rather wonder that Dr. Birch, in describing the terra cotta of the Greeks, has not drawn attention to the neglect among ourselves in modern times of so valuable a material. Happily the use of terra cotta in architecture is becoming more common, but no one seems to have thought as yet of employing it for ionic busts. Remembering the admirable portraiture which the Italians of the sixteenth century produced in coloured terra cotta, we most heartily wish that our own sculptors would sometimes adopt the material in place of the conventional white marble. Such portraits would be infinitely cheaper and a great deal more life-like. We could promise, we think, a very remunerative sale to any enterprising artist who would produce in coloured terra cotta at a low price really good bust-portraits of the famous men of the day. Dr. Birch assures us that the Greeks often used this material for the statues of the gods which stood in the temples, as well as for multiplied copies of them on a reduced scale (perhaps for private use), and also for votive images; and he figures a head of Pallas Athena, surmounted by a winged Nike, which was found at Calvi, and which seems to be of a very high order of art. The character of the face indeed much resembles that of the majestic bronze head from the Castellani Collection which has been lately acquired for the British Museum. We may observe that many of the treasures from the National Collection are engraved in this volume; such as the graceful coloured statuette of Aphrodite from Calas. The fact that coloured terra cotta was so much used by the Greeks in these ways is not to be forgotten in balancing the arguments pro and con in the much-disputed question of applying polychromatic decoration to sculptured marble. Some of our readers perhaps may have forgotten that the cooper's trade is much later than the potter's, and that the Greeks kept their wine in great earthenware *pitheoi* instead of hooped wooden casks. These are gigantic vessels, large enough to hold a man easily. And the tub of Diogenes was in reality such a *pitheos*. He is represented in many works of ancient art as stretching his body out of one of these vessels in his famous interview with Alexander. A lamp so

ornamented is figured in the present volume. Of all the specimens of Greek ceramic art, the painted vases are the most beautiful and the most interesting. Dr. Birch treats this branch of his subject with special fulness. Among other things, speaking with the authority of an expert in the art, he describes the tests whereby, in these days of skilful forgery and imitation, a genuine ancient vase may be distinguished from a counterfeit. There have been organized industries for the production of fictitious vases, such as those of Pietro Fondi at Oorfu and Venice, and of the Vassal family in Venice. Dr. Birch adds Wedgwood to the number of such fraudulent imitators. But surely Wedgwood did not wish to deceive his customers into the notion that they were buying real antiques. The processes of the manufacture of these Greek vases are carefully described; and a coloured illustration, taken from a kylix found at Vulci, and now in the Munich Museum, pictures the industrial labours of a Samian pottery, Homer himself being represented as forming one of the group. When one remembers the hideous chimneys of the countless furnaces of the Staffordshire Potteries, it is interesting to see, in this picture, the chimney of the ancient furnace finished off at the top with a wreathed head of Pan. After describing the processes of the art, Dr. Birch proceeds to give an account of the successive styles of vase-painting, distinguished chiefly by the colours of the figures. Thus the brown figures are earlier than the maroon. Then come black figures in two divisions, followed by a fashion of black figures on a cream-coloured ground. Then come red figures, subdivided into a strong, a fine, and a florid style. Vases in polychrome betoken the decadence of the art. The question of the classification of the subjects painted on the Greek vases is still more complicated and difficult. We quote a passage which well states the conditions of the problem:—

No portion of the history of the fictile art is more difficult to arrange than that of the subjects which the painters selected for the decoration of vases. They embrace a great part of ancient mythology, though not, perhaps, that portion which is most familiar to the classical student. Many subjects were taken from sources which had become obsolete in the flourishing period of Greek literature, or from myths and poems which, though inferior to the great works of antiquity in intellectual style and vigour, yet offered to the painter incidents for his pencil. There must be sought for in the scattered fragments of Greek literature preserved in the scholiasts, in the writers on mythology, in works of an encyclopedical kind, or, finally, in the compilations of the later Byzantine school. The attention paid of late to collect, sort, and criticize these remains has much diminished the labour of the interpretation of art, the most difficult branch of archaeology. It is, however, only since the discovery of a considerable number of inscribed vases that these investigations have attained any approach to accuracy; for the labours of the early European writers on the subject are hypothetical and unsound, except in the interpretation of the most obvious subjects. Up to the present hour, indeed, the identification not only of particular figures, but even of considerable compositions, remains hypothetical. In cases in which we are guided by names, personages the least expected appear in prominent positions; and compositions often represent myths of which not even the outlines have reached the present day. Modern explanations are based upon a few great traditional schools of art, and take no account of the universal diffusion of the fine arts throughout Greece and her colonies, and of the dislike which the Greeks had of those exact copies which mechanism has introduced into modern art. It was from this feeling that the same idea was never treated in the same manner in all its details, and a varied richness, like that of nature itself, was spread over and adorned a very limited choice of subjects.

After reviewing the various hypotheses of Passeri, Italinski, and others, and quoting Millington's sevenfold classification, Dr. Birch proceeds to give a *précis* of the subject, following, as he tells us, the order adopted by Müller and Gerhard. Thus he describes scenes from the *Patroklos*, the *Argonautica*, the *Gigantomachia*, the *Theoid*, the *Heraclid*, the *Katmeid*, &c. It is of course impossible to follow him in detail through these learned and ingenious discussions. The inquiry opens a comprehensive view of the whole cycle of Greek imaginative literature. We would next call special attention to the ability of the seventh chapter, in which the inscribed vases are considered. The several alphabets employed, the dialectic varieties of language, and the phrases and speeches more commonly used are all elaborately explained. It is curious to compare one class of these epigraphs, such as OINANOE KALE, "Oinante is fair," with the parallel conceit, such as STULLA BELLA, of the Italian majolica of the Renaissance. A subsequent chapter chronicles the names and works of a host of potters, who had the wit to inscribe their designs, and so have come down to posterity. Finally, our author distinguishes with marvellous accuracy the various kinds of Greek vases that were in use, and enumerates the several potteries of which the existence is now known. What has to be said of Etruscan pottery is contained in one brief chapter: Roman pottery is treated, as it deserves, at greater length, and on the same general principles as the pottery of Greece. First, that is, we have an account of the manufacture, especially in its more useful forms. And then the ornamental vases are described in order. The work concludes with an interesting section on the ceramic art of Northern Europe. Specimens of British or Anglo-Saxon pottery are continually being exhumed; and the lucky finders may be referred to Dr. Birch's volume for all the information which they can want respecting them. The usefulness of this very complete manual of Ancient Pottery is enhanced by most minute and copious appendices, in the compilation of which the author was assisted by his son, Mr. W. de G. Birch, also, like his father, an officer of the British Museum. These embrace a list of the known inscriptions on Roman tiles and on Roman lamps, amphoræ, and mortaria. There are also lists of the names of Roman potters of the Samian or red ware. And an abundant verbal index (in which we regret to say we have detected some inaccuracies) makes the whole work easily available for the use of the student or collector. If there be room for any adverse criticism on this

volume, it will be found in the want of a more lucid arrangement of the matter. The fault arises in a great measure, no doubt, from the fact that the present edition has not been entirely recast. As a consequence of this, there is not unfrequently a certain amount of repetition.

THE SQUIRE'S GRANDSON.*

MR. ST. JOHN CORBET would have done better to have embodied the plot of *The Squire's Grandson* in a comedy rather than a three-volume novel. It is essentially a situation to be acted, not a story to be told. For, though told smartly and with abundance of good temper and animal spirits, the interest is lost by a method of presentation entirely out of keeping with the subject. A stage father and a stage son mixed up in stage incidents of various kinds do not make a novel pleasant reading, how laughable soever they may be on the boards. In a novel we look for life-likeness as well as subtle delicacy of character-painting, and for incidents which are possible in the daily life of the class written of; but the strength of a comedy lies in its leading situations, and the broader the humour, the more ridiculous the characters, and the more strained the incidents, the greater is the amusement of the audience, and the more completely is the author held to have succeeded.

The character of Sir Raymond Luttrell, the squire who gives part of the title to the book, is simply the caricature of a farce. Not the most outrageous impersonation of tyrannical absurdity ever dressed in a bob-wig and George III. waistcoat is less true as the picture of an English gentleman than is this mighty son of Anak, who has "muscle on the brain," and judges men and women, especially women, by their thighs and sinews, what they weigh, or rather "how much they draw," the height to which they have grown, the thickness of their legs, the goodness of their digestion, and the amount of physical fatigue they can undergo. He is a strong man himself, and he "lives in Bigness." "A lover of the Enormous," worshipping thighs and sinews, and admiring muscle and bone, he is also a man of "severe plainness of speech," seeing strength "in language emphatically neat, because unwatered with effeminate gaudiness and colouring." Part of his manliness of language consists in certain odd expressions, such as "flog me if I don't" do such and such a thing; "may I be forgiven if I" do such and such a thing; "damme" on very small provocation; with a prodigal use of donkeys, fools, and other terms of abuse, when any one differs with him on any matter whatsoever. His biographer, nevertheless, is anxious to assure us that strong language is not necessarily bad language; and that if Sir Raymond was "hardly qualified to edit the works of the Pure Literature Society, he was equally unfitted to shine in the company of drunken bachelors." "As for his literary powers, they stopped short at the composition of ungrammatical letters," in which he was certainly beyond the great mass of mankind. We will give Mr. St. John Corbet's description of this old impossibility, being the smartest thing in the book:—

Immense man he was, as Frank had said, yet by no means a lumbering, elephantine, cumbersome man. He stood over six feet in height, and was the most perfectly proportioned giant you could see anywhere. His broad, imposing back, his fine, outstanding chest, his sinewy arms and legs—all were to a hair's breadth exactly the size they ought to be. Everything about him was the perfection of symmetry, and the very best of its kind. Add to this that the old gentleman had a strikingly handsome face, sharp expressive eyes, and a countenance which, despite a slight suspicion of sternness, betokened infinite good humour and joviality. His head was by no means bald, but he kept his white hair short, and so gave himself a smart military appearance. Sir Raymond was not a man you would like to offend; though apparently the incarnation of British hospitality and good cheer, there was a Quarter Sessions look about his eyes, and you could see that he was just the chairman to give a couple of poschers a wholesome and satisfying sentence. Yet he was a person whom you could not fail to love, one whom you would trust as a friend through storm and heat, one whom you would dine with in winter had you to travel all the way on a snow-plough.

Of course, he wore a spotted neckerchief, gaiters too, and very uncomfortable, lazy collars; and, of course, the being he hated, loathed, and despised ten thousand times more than the Evil One, was a rich snob.

Frank was indeed fond and proud of him. He used almost to think that Her Majesty's Government ought in one way or other to make his father an affair of the nation, and to see that he did not die out. He felt that the old gentleman was as much a part of the nation's history as Stonehenge or Hadrian's Wall, and if he had had his own way, he would have had him photographed, graphotyped, talbotyped, and produced, for public benefit, by the Woodbury and every known process under the sun.

The determination of this muscular old squire is that his son and heir Frank shall marry bone, and so rescue the race which, by its too long devotion to blood, is now, in this generation, giving signs of dwindling into light weights and etherialities. For Frank is only five foot nine, and Ralph, the younger boy at school, gains prizes instead of growing inches. At first his designs take the direction of a certain Miss Kitty Tillett, the daughter of a farmer at the Grange; a lady in her way, seeing that her mother was the daughter of a clergyman, and that she is a good well-bred girl on her own account. But her claims to Sir Raymond's admiration are purely physical. "I believe, Dick," he says to his godson, Richard Heriot, a younger son of Anak, and of precisely the same height as himself, "that you, Kitty Tillett, and I, could pump as much water as the donkey-engine in five minutes. My word, Kitty's arms are strong ones. I got the saucy lass to let me feel

them this morning, and flog me if they weren't magnificent arms—royal limbs. I should have kissed her, I believe, if I hadn't been lord of the manor and your godfather." A little further on his commendation takes another turn:—"What a woman she would be for a man to have on his arm! why she might face old Nick himself and not turn a hair." And, still continuing the conversation, after contemptuously putting aside one lady because she has "got no wind and blows like a grampus," and another because "her legs are like a couple of pencils," he mentions Kitty's legs with a kind of religious veneration, and propounds football as the touchstone of a woman's worthiness. There is another girl, not in the picture, whom also he affects as the fitting wife for Frank, because he once saw her playing football; but when Miss Diana Heriot comes into view, she distances all competitors, and the Squire goes down before her—"England in petticoats," as he calls her, with an excess of admiration that might tell on the stage, but that seems more silly than amusing in a book. He meets her and a certain Miss Lily Gaythrope, who figures for half the first volume as Miss Unknown, at Lady Orchester's "hay." Miss Gaythrope has the misfortune to be a light weight, with a tendency to headaches, and of no special physical ability. But Frank has fallen in love with her, and she with him, on short notice; and the contrast between her and the young lady who has legs and thighs and sinews is not favourable to the progress of the love affair. To be sure Miss Lily is brave in more senses than one. She puts herself into a boat on the little lake in the park, and allows Frank, to whom she has just been introduced, to coach her in the art of rowing; learning her lesson so well that, after a very few instructions she, according to Mr. St. John Corbet's manner of narration, "stuck to the work manfully, pulled well within herself, wasted no 'boof' by wriggling all over the boat, and gradually settled down into something like time." She managed, however, to catch two crabs, and to upset the boat; when she would have been drowned but for Frank's diving after her, "oaring his arm" and bringing her safe to land. Meanwhile old Sir Raymond comes to the "hay"; sees Diana; mutters "eleven stone if she's an ounce"—"five feet six or seven if she's an inch." "Damme, I never saw such a neck and shoulders in my life. Walks on a pair of substantials, I'll be bound, and rides like a jockey. May she be forgiven if I fall down and worship her." Miss Heriot, therefore, is to be Mrs. Frank Luttrell, and he will give the young couple the Grange and three thousand a year.

But though the young lady is pretty, unaffected, amiable, and by no means clumsy, with all her inches and flesh, Frank's heart has gone once and for all to Lily, and he will not take Miss Heriot even to keep peace with his father, and make him happy in his last days. It is not only for the mere fact of the wife that the squire is so intent on his son's marrying bone. He is thinking of his grandchildren. He wants big grandchildren, bony grandchildren, boys and girls of thighs and sinews like himself or his godson Richard Heriot. "It is to my grandchildren I look for perfection," he says to Miss Heriot in their first conversation; "if I don't have a grandson like your cousin Richard, I shall go crazy." To such a man as this pretty Lily Gaythrope is only an example of "nature's how-not-to-do-it"; and he is furious when, on an introduction to "Miss Finnikin Doll," she shows her cards too plainly, and tells him of her ducking in the lake, with his son Frank as her deliverer.

Perhaps the oddest part of the book is the transparent way in which Lily both endeavours on her own account, and is instructed by Frank, how best to please Sir Raymond, and how most surely to avoid displeasing him. Few sons of an affectionate and respectful kind would show up the weaknesses and follies of a father on a first introduction, even to a charming young lady; and few young ladies would confess even to themselves that they had any special need to learn how to please the father of a young man just known. There ought to have been a much longer acquaintance between the two to have made this part of the book pleasant or possible. As it is, it is neither. It is of an essentially stage-like hurry and precipitancy which might go well on the boards, but which goes very far from well in a novel.

Of course Sir Raymond is a martyr to the gout; and of course during his attacks bears himself with a mixture of heroism and bearishness that seems to be the author's idea of how "a grand old lion bound hand and foot with intolerable pain" would naturally behave. He insults his medical man; calls his son names; abuses his wife's brother who is "serious," and who has just given Frank a volume of prayers written by himself. But as it is part of Sir Raymond's creed "to believe all men of his own age to be donkeys, knaves, or lunatics," this is no novelty to his son, who by this time must have been pretty well seasoned to the opprobrious epithets which came to him for his own share, and were flung so liberally on others. The speech which the grand old lion makes to Frank about his uncle is too characteristic to be omitted:—

"Your uncle is, without exception, the biggest old donkey I ever met, and in matters of religion the most confounded humbug that walks the earth. When he heard I had proposed to his sister, flog me if he didn't write me a letter three miles long about the responsibility the step would involve, the necessity for considering what I was about, and the devil knows what else besides. I was going out shooting the day I got it, and damme, I used it for wads, and shot away my lord's good advice at the rabbits!"

The difficulty of the position, however, remains the same, though Frank's coming cheers his father and makes the gout more tolerable. "England in petticoats" on the one side, and Miss Finnikin Doll on the other, with a young man's perverse love and an old man's unconquerable will—it seems a problem difficult of solution, a nut very hard to crack. It is so hard that Frank and

* *The Squire's Grandson: a Tale of a Strong Man's Weakness.* By Robert St. John Corbet, Author of "The Canon's Daughters," &c. 3 vols. London: Tinsley Brothers. 1873.

his beloved are forced to have recourse to a subterfuge. They marry secretly, with the full consent of Sir Edward and Lady Gaythrop, the father and mother of Lily; to which of itself we should object as simply impossible in the society in which these people are said to live. The chiefs of departments do not indulge young men in secret marriages with their daughters, on the chance of a big bouncing baby, all bone, which shall satisfy the requirements of Hercules and objecting fathers-in-law. However, Sir Edward is "reasonable," and suffers his daughter to marry Frank unknown to his family and the world, and to live in a wood near Massmere, Sir Raymond's place, like an enchanted maiden, or rather like a mother who has no marriage to conceal. Here she gives birth to a huge boy baby, who looks six weeks old when he is only two, and three months when he is only one. The baby is artfully shown to the Squire, and the Squire immediately venerates the baby as "good twenty-two carat English muscle, unalloyed with a grain of gristle." When he learns whose it is, he threatens to be unmanageable again, but after calling Frank and Lily a few hard names, such as "cheats and liars," he relents, and the curtain rings down on a speech which, delivered behind the footlights, would be applauded to the echo by both gods and groundlings. But what becomes of Miss Periot? Kitty Tillett finds a Life-Guardsman, but "England in petticoats" is thrust aside in the most unceremonious manner; which is hard, seeing the account made of her in the first volume.

On the whole, *The Squire's Grandson* is clever but slight, amusing but ridiculous, good-tempered but more than trenching on coarseness, and utterly devoid of art from end to end. Mr. St. John Corbet can do better than this, but to do better he must take more pains and give more thought to his work. This kind of scampering work is never good, from whose hand soever it comes.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

Now ready, VOLUME XXXV., bound in cloth, price 16s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

Copies of the SATURDAY REVIEW Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newsagent in Town or Country on application to the Publisher.

ADVERTISEMENTS.

CRYSTAL PALACE.—FIFTH NATIONAL CAT SHOW
Opens on Saturday next, September 22nd and 23rd. This Collection will comprise all the known varieties of the Domestic Cat, and examples of the several Wild Species. It has been found possible on this occasion to increase the number of Classes in the Schedule, which will give this exhibition an exceptional interest.
Admission, Saturday, 1s. 6d.; other days, 1s.; or by Guinea Season Tickets.

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRÆTORIUM," with "Right of the Graduation," "Christ's Marriage," "Famous de Rimini," "Sophie," "Andromeda," &c., at the **DORÉ GALLERY**, 25, New Bond Street. Ten to Six.—Admission, 1s.

ELIJAH WALTON.—EXHIBITION, including "A Storm at Sea" and "Sand Storm in the Desert," and many new and important Drawings. Alpine and Eastern, NOW OPEN at Burlington Gallery, 101 Piccadilly. Ten to Six.—Admission, with Catalogue, 1s.

BRITISH MUSEUM.—The BRITISH MUSEUM is OPEN to the Public from Ten o'Clock on Mondays, Wednesdays, and Fridays, and from Twelve o'Clock on Saturdays. On application to the PRINCIPAL LIBRARIAN, special facilities are afforded for the study of specified branches of the Collections on Tuesdays and Thursdays; the number of not more than fifty in number for the Lower Galleries, and thirty for the Upper Galleries.
J. WINTER JONES, Principal Librarian.

ST. BARTHOLOMEW'S HOSPITAL and COLLEGE.
The WINTER SESSION will begin on Wednesday, October 1.
The Clinical practice of the Hospital comprises a service of 710 Beds, inclusive of 34 Beds for Convalescents at Highgate.
Students can reside within the Hospital walls, subject to the College regulations.
For all particulars concerning either the Hospital or College, application may be made, personally or by letter, to the RESIDENT WARDEN of the College.
A Handbook will be forwarded on application.

QUEEN'S COLLEGE, Galway.—FACULTY of MEDICINE.
SESSION 1873-4.

The FIRST MATRICULATION EXAMINATION for the Session 1873-4 will be held on Friday, October 21.
The EXAMINATIONS for SCHOLARSHIPS and EXHIBITIONS will commence on Thursday, October 23.

By a recent regulation of the Council, all Scholarships and Exhibitions of the Second, Third, and Fourth Years may now be competed for by Students who have obtained the requisite standing in any Medical School recognized by the Senate of the Queen's University, and have passed the Matriculation Examination in the College.

At the ensuing Examination Eight Scholarships, of the value of £25 each, will be offered for Competition, viz. Two to Students of the First, Second, Third, and Fourth years respectively. In addition, Four Exhibitions of £15 each will be offered: Two to Students of the First and Second years of the Second Year respectively, and Two Exhibitions of £10 each—one to Students of the Third and Fourth years respectively.

All Scholars are exempt from payment of a moiety of the Fee for the Compulsory Classes. This rule does not apply to the Class of Medical Jurisprudence.

By Order of the President.

September 5, 1873.

T. W. MOFFETT, LL.D., Registrar.

THE OWENS COLLEGE, Manchester.
The SESSION, 1873-4, will be opened in the New Buildings in Oxford Road.
Principal—J. G. GREENWOOD, B.A.

PROFESSORS AND LECTURERS.

Greek	Professor J. G. Greenwood, B.A. (Fellow of University College, London.)
Latin	Professor A. R. Wilkins, M.A. (Fellow of University College, London.)
Comparative Philology	Assistant Lecturer in Greek and Latin, Mr. Edwin B. England, M.A.
English Language and Literature	Professor A. W. Ward, M.A. (Fellow of St. Peter's College, Cambridge.)
Ancient and Modern History	Assistant Lecturer, Mr. Thomas N. Toller, M.A. (Fellow of Christ College, Cambridge.)
Mathematics	Professor Thomas Barker, M.A. (Late Fellow of Trinity College, Cambridge.)
Natural Philosophy	Assistant Lecturer, Mr. A. T. Hoar, M.A. Professor Balfour Stewart, M.A., LL.D., F.R.S.
Physical Laboratory	Professor Thomas H. Core, M.A. Demonstrators (Mr. F. Kingston, Mr. A. Schuster, Ph.D.)
Civil and Mechanical Engineering	Professor Osborne Reynolds, M.A. (Fellow of Queen's College, Cambridge.)
Geometrical and Mechanical Drawing	Assistant, Mr. John H. Miller, B.Sc.
Logic and Mental and Moral Philosophy	Professor W. Stanley Jevons, M.A., F.R.S. (Fellow of University College, London.)
Political Economy	Professor James Bryce, D.C.L. (Fellow of Oriel College, Oxford.)
Jurisprudence and Law	Assistant Lecturer, Mr. T. S. Hollan, M.A., B.C.L. (Late Fellow of Exeter College, Oxford.)
Chemistry	Ditto, Mr. J. B. Gunning Moore, M.A. Ditto, Mr. Wm. R. Kennedy, M.A. (Fellow of Pembroke College, Cambridge.)
Chemical Laboratory	Professor H. E. Roscoe, B.A., Ph.D., F.R.S. Senior Demonstrator, Mr. C. Schorlemmer, F.R.S. Junior Demonstrator and Assistant Lecturer, Mr. W. Dittmar, F.R.S.E. Assistant (Mr. W. G. Williams, Demonstrator (Mr. H. Grimshaw, Lecturer, Mr. C. Schorlemmer, F.R.S.
Organic Chemistry	Professor W. C. Williamson, F.R.S.
Animal Physiology and Zoology	Professor Arthur Gamgee, M.D., F.R.S.
Vegetable Physiology and Botany	Lecturer, Mr. W. Boyd Dawkins, M.A., F.R.S., F.O.S.
Practical Physiology and Histology	Lecturer, Mr. Charles A. Burghardt, Ph.D.
Geology and Palaeontology	Professor T. Theodores.
Mineralogy	Lecturer, Mr. Hermann Breyman, Ph.D.
Oriental Languages	Lecturer, Mr. William Walker.
French Language and Literature	Lecturer, Mr. Frederick Bridge, Mus.B.
Free Hand Drawing	
Harmony and Musical Composition	

The next SESSION commences on October 7.

Candidates for Admission must not be under Fourteen years of age, and those under Sixteen will be required to pass a preliminary examination in English, Arithmetic, and the elements of Latin.

Prospectuses of the several departments of the Day Classes, the Evening Classes, and the Medical School, and of the Scholarships and Entrance Exhibitions tenable at the College, will be sent on application.

J. HOLME NICHOLSON, Registrar.

NOTICE.—ROYAL SCHOOL of MINES, Jermyn Street, London.—The TWENTY-THIRD SESSION will begin on Wednesday, October 1. Prospectuses may be had on application.
TRENHAM REEKS, Registrar.

WHITWORTH SCHOLARSHIPS.—IMPORTANT

NOTICE.—The important changes in the mode of competing for these Scholarships, and in the conditions of holding them, which came into force at the next Competition, have been published. The Revised Rules should be obtained at once, by all who are likely to present themselves for Examination, on application to the SECRETARY, Science and Art Department, South Kensington, London, S.W.

By Order of
THE LORDS OF THE COMMITTEE OF
COUNCIL ON EDUCATION.

EDUCATION (Protestant) for YOUNG LADIES, at Landau, Rhinephalz, Germany. Conducted by Madame HEICHLAND, assisted by highly qualified resident French, German, and English Governesses. Terms, 50 Guineas per annum. No extras. In this first-class Establishment the comforts of a liberal, cheerful home are combined with the highest educational advantages. A large staff of University Professors of repute attend daily. A superior intellectual culture is in this School one of the chief objects. German and French constantly spoken. Landau is an extremely healthy, pretty little town, picturesquely situated at the foot of the celebrated, fertile Harz Mountains, and is in direct communication with England by rail via Paris, Cologne, or by the Rhine. The highest references in London if desired.—Apply, personally or by letter, to Mr. and Mrs. KOCHE, Highgate, N., London.

LADIES' FINISHING SCHOOL.—Miss FAIRLIE G. ANDERSON (formerly of 21 Gloucester Gardens, Hyde Park) will RE-OPEN School on September 15.—25 Portico Square, Hyde Park.

Transmission abroad.]

Price 6d.

THE ASHANTEE WAR.

THE Colonial Office, and the military authorities in charge of the Ashantee expedition, have no reason to complain of a deficiency of advice. Twenty years ago Prince ALBERT thought, with his usual good sense, and said with less than his usual prudence, that constitutional government was on its trial. On a much smaller scale government by newspapers is now on its trial. Sir GARNET WOLSELEY and those from whom he receives his instructions have wisely kept their intentions to themselves, while they have been assailed on all sides with contradictory counsels. At one time there seemed to have been a general consent of opinion that the commander of the expedition could only avoid an unequal conflict in the bush by turning the flank of the enemy and marching straight on his capital. The rumour that the General had asked for the means of laying down twenty or thirty miles of railway naturally called attention to the vast cost of petty wars in Africa, or in other parts of the world. The risks of an advance into the interior of the country were vividly described; and the difficulty or impossibility of conveying stores and of preserving the health of European troops occupied the pens of many correspondents. The last phase of the discussion, until the news of the recent disaster arrived, consisted in a protest against unnecessary war, and in earnest recommendations to the Government to reconsider the policy which it is supposed to have adopted. If the Ashantees, who are not themselves readers of newspapers, have engaged the services of educated natives on the coast to procure information, it is satisfactory to know that they must be utterly puzzled by the announcements and criticisms of well-informed writers. The high estimate which, like all uncivilized nations, they place on their own importance will be confirmed by the general attention which their affairs seem to have excited in England. Some of the numerous communications which have appeared may probably deserve the attention of the Government. It seems to be injudicious to stint the number of officers employed in the expedition, when every regiment in the service would, in case of need, supply volunteers. The desire of employment, and the laudable anxiety to win credit and promotion, operate as strongly as at any former time of the English army. Some historical speculators have attributed much of the warlike spirit of the middle ages to the discomfort of home and to the general want of occupation. The monotony of barrack life may in the same manner perhaps stimulate the love of military enterprise.

Exhortations to the Government on the duty of preferring diplomacy to war are probably superfluous; and since the untoward result of Commodore COMMORELL'S reconnoitring expedition, there is little hope of maintaining peace. Mr. GLADSTONE and his colleagues are not likely to waste either money or human life where the objects of a possible war may be attained by negotiation. Whatever may be their future policy or intentions, their course hitherto has been prudent and right. The Ashantee invaders would be unlikely to listen to reason unless they understood that it was backed by force. If they were allowed without opposition to establish their supremacy over the protected tribes, the settlements on the coast and the property of English traders would be exposed to constant aggression. If the Ashantees are disposed to resist to a display of irresistible strength, war may still be avoided. It would be well if they could study the lists of stores, of guns, and of munitions of war which are already accumulated at Deptford and Woolwich. To civilians the preparations which have been made seem to

indicate official activity and foresight. Alarmists who have proclaimed the impossibility of employing beasts of burden in a West African campaign may perhaps be surprised by the despatch to the Gold Coast of a steam traction-engine, which will certainly not suffer from the attacks of venomous flies. A stock of wooden barrack huts will be forwarded from England, and all possible precautions will be taken against the dangers of the climate. On this occasion at least the Government cannot be fairly charged with the error of drifting into war. All necessary measures have been taken as if on the assumption that a conflict was unavoidable; but peace will still, if possible, be preserved. The destruction of the town of Chamah may perhaps have counterbalanced, in the minds of the native chiefs, the effect produced by their successful ambushade. If it is true that the main demand of the Ashantees is for commercial access to the coast, there need be no hesitation in complying with their wishes. It is quite unnecessary that they should occupy the territory of the protected Fantees, who, with all their faults, are not dangerous neighbours to the trading settlements. It may be hoped that when the conquest of the Fantee territory has been effectually prevented, the dependent chiefs will understand for the first time their true relation to the paramount Power. Not long ago, at the instigation of half-taught native demagogues, and with the connivance of injudicious English functionaries, the Fantees were playing with fantastic schemes of federal and constitutional government. When they have recovered from their present alarm, they will perhaps discover that their chief constitutional duty consists in obeying orders.

It is quite unnecessary to caution the Government or the country against the indulgence of the obsolete desire of territorial aggrandizement. No politician in the present day would dream of founding a West African Empire for the sake of profit or of glory; yet it is not improbable that it may become expedient to establish some kind of sovereignty over the Ashantees. It may be cheaper to prevent troublesome neighbours from preparing for war than to repel periodical invasions. It is not at present known that any other aggressive tribe is to be found in the neighbourhood of the settlements; and a perpetual and compulsory peace would be an unmixt advantage to the entire region. It might be difficult to prove that the profits of the trade on the coast afford full compensation for the cost of maintaining political and military supremacy; but, on the whole, England is richer and more powerful through the adventurous spirit which has directed its colonial policy. It is remarkable that the Gold Coast settlements have in recent times been retained by private enterprise when the Government, after a local disaster, had determined on retiring from the country. The merchants, after managing their own affairs with success for several years, transferred the undertaking once more to the Colonial Office; and the Government could scarcely without dishonour again abandon the duty of protecting the lives and property of its subjects. To a certain extent the late treaty with the Netherlands involved a national obligation to protect the trade on the coast. In accordance with modern policy, the English Government undertook to allow foreign merchants equal advantages and freedom of access; and the confession that it was impossible to offer protection against barbarians would be humiliating, if not dishonourable. Although it is difficult to unravel the complications of African diplomacy, there seems to be reason for believing that the aggression of the Ashantees was in some way connected with the conclusion of the Dutch treaty. It is probable that any change would be regarded with suspicion; and it may have been impracticable to continue precisely the

same relations which had been established with the Ashantees.

It appears on good authority that Sir GARNET WOLSELEY has received with laudable candour the numerous suggestions and warnings which have been offered in public and in private. The most experienced officers who have served on the Gold Coast have been consulted, and the General himself possesses as large an experience of military operations as any officer who possesses the invaluable qualification of being still in the prime of life. In anticipation of the landing of the expedition, efforts have been made to organize native forces under capable leaders. It is of course still possible that the enterprise may fail; but no reasonable precaution seems thus far to have been omitted. Those who possess no special knowledge of the country or the climate will not readily be persuaded that, when Englishmen have for two or three centuries managed to reside and to conduct their business, it is impossible to defend the settlements from the invasions of a savage enemy. It may be true that precisely the same obstacles have not there or elsewhere been successfully encountered; but the energy which has prevailed over difficulties and dangers in all parts of the world is still abundantly forthcoming, and the result of modern study of the art of war has been to cultivate preliminary care and forethought. When the material superiority of civilization to barbarism was far less definitely established, Spanish adventurers conquered America almost without aid from home, and Englishmen dispossessed the rulers of India. Nothing would have been easier than to prove beforehand the impracticability of enterprises which were nevertheless accomplished by means of a fixed resolution to succeed. In this case there is no motive of religious enthusiasm or of cupidity, but it is enough for English officers and soldiers to know that they are doing their duty under the observation of their countrymen. The impending war, or the possible treaty which may render war unnecessary, ought to diminish the risk of future collisions. Warlike races usually possess a vigour and manliness of character which renders it possible to deal with them, and in former times the Ashantees have fulfilled with reasonable fidelity the stipulations of treaties. The dependency which has lately found expression in newspaper correspondence is, notwithstanding the unlucky result of the expedition to Chamah, at least premature.

THE COUNT OF CHAMBORD AND MARSHAL MACMAHON.

THE two subjects which occupy French politicians at present are what the Count of CHAMBORD is likely to say about himself, and what the Duke of BROGLIE is likely to say about Marshal MACMAHON. There is ample room for speculation on both these points, since neither the Pretender nor the Minister seems inclined to say anything. The Duke of BROGLIE's silence is perfectly intelligible. He is waiting to see what becomes of the Fusion, and the fate of the Fusion depends on the Count of CHAMBORD. If he neither waives his pretensions to the throne nor consents to reign on constitutional principles, it is pretty clear that the Fusion must melt away into air. No one on the Orleanist side has done more to further its interests than M. JOHN LEMOINNE. He had been the most distinguished convert the party had contributed to the Republic, and he had quite lately made a solemn recantation, and signified his repentant desire to see the Republic sent about its business. Yet even he feels that, if the Count of CHAMBORD remains obstinately silent while his partisans are foolishly talkative—if, instead of professions of deference to the will of the nation and firm resolutions to abide by the decisions of the Legislature, nothing is to be had except exhortations to go barefoot to the feet of the King, "to ask pardon for 'having sought to be free'—the sacrifice is greater than the Liberal Royalists can bring themselves to make. M. JOHN LEMOINNE does not appear to advantage when he thus complains of the Sovereign whom he welcomed so complacently a few weeks since. But he may comfort himself with the reflection that any loss of dignity he may have sustained is common to the whole Orleanist party. In the person of the Count of PARIS they unconditionally submitted themselves to the representative of hereditary monarchy in France. They knew what the Count of CHAMBORD was. More than once the proposed Fusion had broken down because the Count had put out some fresh

declaration that he was as immovable and as impracticable as ever. Even on the very eve of the visit of the Count of PARIS, he had shown by his letter to M. CAZENOVE DE PRADINES that on religious questions his sympathies were with the extremist section of the Ultramontane Right. Notwithstanding all this, the Count of PARIS persevered, and the Orleanist party was beside itself with joy to think that the Revolution of 1830 had been condoned, and that the elder branch had embraced the younger branch. They might at least have remembered that, as their submission was made of their own free will, and without either asking or obtaining any conditions beforehand, it is not their place to murmur because no conditions have been vouchsafed to them since. The Count of CHAMBORD has been waiting all his life for the time when France should recover from her madness, and seek in legitimate and hereditary Monarchy the peace which she has forfeited by her flirtations with Republicanism, with Constitutional Royalty, with Democratic Imperialism. The Orleanists have of their own accord placed themselves by his side and consented to share his vigil. They have no right to find fault with him because he does not invite France to begin a new career of political coquetry by presenting himself as a Constitutional King.

There are two difficulties in the way of the Count of CHAMBORD doing what the Orleanist section of the Fusion call upon him to do. In the first place, it is hard for him to say anything; in the second place, it is still harder for him to say anything to the purpose. He is in the position of a kind father deserted by his unthankful children. It is the children's place to come back to him, not his to hold out inducements to them to return. His terms have never varied; they have from first to last been submission on their side, to be followed by gracious forgiveness on his side. Now some of his children, a little less obdurate than the rest, have yielded the required submission, and then, almost before they have risen from their knees, have begun to insist on his making this and that concession as the price of their continuing to live with him. What can the Count of CHAMBORD do in such a case except remind them that it is they who profess to have changed, not he; that it is they who have consented to accept his idea of Monarchy, not he who has consented to accept their idea? The theory on which the Count of CHAMBORD's whole life has been arranged seems incompatible with the idea of his offering pledges or guarantees as the price of his restoration. Supposing, however, that this natural unwillingness on his part can be got over, and that the Count of CHAMBORD persuades himself to put forth some declaration of the principles on which he is ready to govern France, what is the declaration to include? It must contain something about the history of France for the last eighty years. Yet what can a BOURBON say of the First Revolution that Liberal Frenchmen can endure to hear? It must contain something about that particular event which made exiles of the elder branch of the Royal House. Yet what can HENRY V. say of the Revolution of 1830 that can please the men or the children of the men who placed LOUIS PHILIPPE on the throne? It must contain something about the Church. Yet what can the Sovereign who has consistently taken PIUS IX. for his example say that will satisfy a nation which has no other thought about the POPE than a determination not to draw the sword in his behalf? It is very well to censure the Count of CHAMBORD's obstinacy in not meeting the wishes of his followers by a frank acceptance of Liberal principles in Church and State, but if his critics would take the trouble to draw out the phrases in which this acceptance is to be conveyed, they would find that it is not very easy to frame them. Besides this, the Orleanists are but one element of the Fusion, and a declaration which would thoroughly please them might thoroughly displease the other element. The natural counsellors of the Count of CHAMBORD are not Orleanists, but Legitimists; not laymen who regard the Church as a useful political engine, but priests who regard the State as a mere instrument with which the Church is to work out her designs for the good of mankind. His special friends in the Assembly are not likely to draw up a political manifesto that will meet the views of the *Journal des Débats*, nor is the Archbishop of PARIS likely to be more successful in composing a religious manifesto. If the barrier between Orleanists and Legitimists had been merely personal—if there had been no question as to the principles on which France should be governed, but only as to whether the carrying out of these principles should be entrusted to the Count of CHAMBORD or the Count of PARIS—the visit of the latter to Frohsdorf would

have been a patriotic surrender of individual claims. But underneath the personal question lies a political question. The issue between the two sections of the Royalists is not who shall govern France; were it that only, all the obstacles to union between them would now be removed. It is how France shall be governed; and no matter what declarations the Count of CHAMBORD may be persuaded to put forth, the antagonism between Legitimacy and utility, between the Syllabus and modern society, will remain unsoftened.

The rumours as to the intention of the Ministry to propose a prolongation of Marshal MACMAHON's powers are probably so far well founded that the Duke of BROGLIE is seriously considering how the Conservative party ought to act in the event of a Restoration being proved to be impossible. He is too shrewd a politician not to foresee that it is necessary to be prepared for this contingency. No doubt he would like to see a moderately Liberal Restoration, and in his dread of Radicalism he might even be willing to put up with a Restoration with the moderately Liberal qualification omitted. But this frame of mind is quite compatible with realizing how improbable it is that the Count of CHAMBORD will lend himself to the former solution, and how impossible it is that France should accept the latter. In that case what are the Conservatives to do, except prolong Marshal MACMAHON's powers? There are great disadvantages attendant upon such a move, but when there is only a choice of evils, this is not a conclusive argument against any given selection. Monarchy being disposed of, there will remain only three alternatives—the Empire, the Republic, and a continuation of the present provisional and anomalous compromise. We acquit the Duke of BROGLIE of any conscious design of restoring the Empire. That, as M. THIERS predicted, may yet be the result of his action on the 24th of May; but it will not be the result he intended. Even if, as is far from unlikely, the Duke is slowly coming round to the conviction that a Conservative Republic is, under present circumstances, the best form of government for France, he would hardly care to proclaim his conversion quite so early. And even on this hypothesis, the prolongation of Marshal MACMAHON's power would on the whole be the best way out of the immediate difficulty. It is of the utmost importance to the prospects of a Conservative Republic that it should be set up under conditions which will quiet the alarms of the Conservative party. It may be said that the conditions which M. THIERS's Government supplied ought to have sufficed for this purpose, but as a matter of fact they did not. But with Marshal MACMAHON at the head of affairs the most timid shopkeeper or the most suspicious peasant may feel that his life and his property are safe, and that he may buy and sell and get gain with no anxieties save such as flow from the ordinary vicissitudes of business. Political predictions are notoriously unsafe in France; but as between the Count of CHAMBORD and Marshal MACMAHON, it seems more probable that Marshal MACMAHON will remain President than that the Count of CHAMBORD will become King.

INCOME-TAX FALLACIES.

A FAINT revival of the old controversy on the Income-tax may perhaps only indicate the autumnal scarcity of topics of interest. Mr. W. H. GLADSTONE indeed remarked at Whitby that the PRIME MINISTER could not be supposed to regard the tax with especial favour, inasmuch as he formed an elaborate plan twenty years ago for the gradual and total abolition of the burden. It might have been added that since 1853 Mr. GLADSTONE has repeatedly increased and varied the tax, and that he has often and lucidly explained the reasons which render a partial remission unjust, if not impracticable. As the constituency of Whitby were informed in the same speech that Mr. GLADSTONE declined the task of disestablishing the Church only by reason of weariness and advancing years, it may be inferred that the object was rather to consult the wishes of the electors than to give them official information. It is extremely improbable that the most skillful and experienced of living financiers should gratuitously announce the provisions of his future Budget six or seven months in advance. No similar obligation of secrecy is imposed on financial amateurs; nor is there any reason why they should not tender their advice to the Government before it is too late to adopt their suggestions. Mr. LEON LEVI commenced the discussion by proposing the commutation of the tax on trading and professional incomes into an impost, not

on the class which was to be relieved, but on the whole community. Mr. JOHN MILL in a well-known passage recommended a House-tax as a fair approach to an Income-tax because, "if what a person pays in house-rent is a test of anything, it is a test not of what he possesses, but of what he thinks he can afford to spend." The assumption that capacity of expenditure rather than extent of possession ought to be the standard of liability to taxation is more than questionable. A shilling got, a shilling saved, and a shilling spent bear the same proportion to the entire wealth of the nation; nor is there any reason why the tax-collector should discriminate between equivalent values. Nevertheless Mr. MILL's theory may be defended by plausible arguments which would be wholly inapplicable to Mr. LEVI's proposal. If a House-tax is a fair and self-adjusted Income-tax, it ought to be imposed once for all, and equally whereas Mr. LEVI's plan is to extend the present house tax as "the simplest mode of providing the two or three millions required to supply the void of the tax on professional incomes." The owners of property are, as at present to pay a percentage on their incomes, and they are also to be mulcted in a House-tax for the benefit of brewers, bankers, cotton-spinners, and lessees of coal. The tax, according to Mr. LEVI's proposal, is to be extended downwards to houses of the value of 10l., and to be graduated so as to increase the rate on higher rents. The present limit of 20l. is arbitrary, and was originally unfair; but Mr. DISRAELI's proposal of including houses of 10l. rental and upwards was rejected by the House of Commons in 1852, and before and since that time the inequality has been in some degree redressed by the self-acting process of readjustment, which is common to all permanent taxes. The wanton experiment of graduation is not more applicable to a House-tax than to any other tax, and it would furnish a mischievous precedent. It seems impossible to convince financial theorists that it is not the business of Chancellors of the Exchequer to correct the inequalities of fortune by altering the relative condition of taxpayers.

Mr. LEVI has been followed, as might have been expected by many other claimants for the relief of the unhappy contributors to Schedule D. The present agitators are perhaps the same who a few months ago less candidly demanded the total abolition of the Income-tax. It was, in fact, never intended that the recipients of fixed incomes should share the exemption with the numerous and powerful body of traders. The repeal of the Income-tax would have been almost necessarily accompanied by the imposition of a tax upon property which would have reproduced the present tax with the omission of Schedule D. It seems almost useless to demonstrate again and again the iniquity of a deliberately partial system of taxation. The enormous sums received annually in the form of profits and professional earnings are as permanent as the amount of rents and interest, and they are far more elastic. If the tax, amounting to two millions and a half, were added to the total returns under Schedule D, Parliament would have gratuitously enriched the trading and professional classes at the expense of the rest of the community. Annuitants, widows, and small fundholders and freeholders are already suffering under the increased price of coal, of which by far the greater part goes into the pockets of the lessees. Mr. LEVI and his allies propose that their small income shall be still further reduced, with the result of adding to the gains of the producers of coal. There are banks in London dating from the seventeenth century, and breweries which were established early in the eighteenth. Few fixed incomes have an equally long pedigree; and yet it is proposed that vast revenues derived from trade should be exceptionally exempt from taxation. Except for the purpose of illustration, any reference to the duration of trading incomes would be irrelevant. It matters nothing whether an income is worth two years' or two hundred years' purchase nor is it material to inquire whether the present recipient have succeeded by descent or purchase to former possessors. One year's income is chargeable with one year's tax, and twenty or fifty years' income is chargeable with the corresponding number of payments. As long as legislation is unaffected by doctrines of Socialism, no Minister would propose that a partial equalization of incomes should, except as an incident of taxation, be effected by means of a forced contribution paid by property to trade. If the public expenses were paid out of the receipts from State domains, no tax would be necessary, and the returns of trade and industry would, under the influence of economic causes, bear a certain proportion to the annual value of realized property.

The present Income-tax would affect all incomes equally, and therefore fairly, if only the receipts under Schedule D were not enormously reduced by fraud and evasion. Mr. LEVI oddly deduces from the losses to the revenue by false returns the strange conclusion that the class which furnishes the delinquents ought to be wholly exempted. "As Mr. GLADSTONE said, 'the exemption of one man means the taxation of another.'" The evasions of a tradesman impose a comparatively trifling tax on the landowner and the fundholder. The exemption of all trades and professional incomes would mean an addition of a considerable percentage to the tax on the returns of property. As Mr. GLADSTONE has frequently explained, the adoption of Mr. LEVI's scheme would involve, not only injustice to all other owners of property, but a direct breach of contract with the national creditor. The Acts which authorised the loans provided that the lenders should be subject to no special taxation, while the opponents of Schedule D deliberately propose to tax the fundholder for the relief of the traders who are included among his debtors. It is impossible to examine the matter from any point of view without finding fresh illustrations of its gross iniquity. The objections to Schedule D which are founded on the temptations which it may offer to fraud hardly furnish a sufficient reason for granting a boon to the wrongdoers.

Mr. WHITE, member for Brighton, in a letter to a local newspaper, undertakes to mitigate the injustice of a discriminatory tax by retaining the charge on quarries, mines, ironworks, and similar undertakings; yet the lessee of a coal mine or the manufacturer of iron is as well entitled to exemption as a brewer or a banker, who in a precisely analogous manner earns a return on his capital. The transfer of ironworks to Schedule A would put ironmasters on the same footing with landowners; but it would merely render the rule of exemption more flagrantly capricious. Mr. WHITE may well save himself the trouble of adjusting taxes with apparent fairness when he candidly admits that it is his object to gratify popular feeling and prejudice by taxing the wealthier part of the community. "It ought not to be forgotten," he says, or rather it may be well in defiance of notorious facts to assert, "that it is the rich alone that now impose the taxes that the poor pay." Mr. LEVI, on the contrary, remarks with truth and candour that, "so far from their being heavily taxed, 'the labouring classes are regarded with special consideration in the present system of finance.'" The truth is that household voters, through their representatives, impose the Income-tax, which is not paid by those who have less than 100*l.* a year, nor indeed by artisans who earn double the amount; but Mr. WHITE's clients expect to be flattered, and they are not disappointed. "Hence," he proceeds, "there ought to be some large 'unmistakable tax levied on realized property, a tax which 'especially taxed rich people, otherwise there would be—I 'might say, there ought to be—much bitterness and discontent.'" The confusion between riches and realized property is common, and perhaps intentional. A small portion of realized property may leave the owner poor, as a large earned income makes him rich. Mr. WHITE subjects to his penal tax every man who receives 100*l.* a year from the Funds or from interest on a mortgage; and, indeed, when taxes are once imposed out of spite, or to propitiate unreasoning envy, it becomes useless to discuss incidental inequalities. If there were no taxes, the rich would still be objects of jealousy; but even Mr. WHITE would scarcely propose that they should be subjected to an arbitrary forfeiture for the purpose of appeasing the bitterness and discontent which he thinks fit to recognize and justify. Any Ministry which may direct the finances of the country will be well advised in leaving the Income-tax alone, as far as its principle is concerned; but the limit of exemption might be fairly raised in consequence of the increased cost of living, and in consideration of the exemption which highly-paid workmen secure for themselves in defiance of the law. There is no reason why a clerk or a curate should be taxed when a collier with double the income makes no return.

THE DOVER ELECTION.

ALTHOUGH the general election is understood to have been postponed till next year, there are abundant signs of electoral effervescence. It appears that there is a crowd of fourteen candidates waiting for the chance of an opening at Bath, whilst at Tralee the Home Rulers and the

supporters of The O'DONOGHUE have come to blows over a vacancy which has not yet been formally declared. It is not very long since a member of an English Ministry thought it necessary to describe The O'DONOGHUE in the House of Commons as a mannikin traitor; but since then messages of peace have naturally confirmed the faith of his countrymen in the efficacy of seditious menaces, each dose of which, it is thought, should be stronger than the last. Under the circumstances The O'DONOGHUE will probably be rejected as a lukewarm patriot. It has been calculated that throughout the whole of the United Kingdom the Conservatives have during the last five years won twenty-eight seats against ten won by the Liberals, and the chances would seem to be for the present still in their favour. The next election will take place at Dover, but there the issues would appear to be too strictly local and private to throw much light on the general drift of opinion. The MASTER of the ROLLS found it convenient to postpone his retirement from the seat until his former opponent, who had announced his intention to renew the contest at the next vacancy, had gone abroad; and Mr. FORBES, the Ministerial candidate, has enjoyed the advantage of his rival's absence. Mr. FORBES has been significantly introduced to the constituency as "a gentleman who 'has the conduct of a large and important railway—a railway which at the present moment is 'spending something like 1,000*l.* a week in the town of 'Dover.'" It has further been pointed out that he is also connected with other Railway Companies, and with various large business undertakings, and that he is "a gentleman able and willing to do the best he can for the benefit 'of the town.'" Mr. FORBES himself has taken care to assure the electors that he has acquired a knowledge of the interests of Dover, and "of the extent to which the interests 'of Dover are identical with the interests of the under-'taking with which he is connected, and with the interests 'of JAMES STAATS FORBES"; and he thinks there is a good deal to be done for Dover, and that "it will answer his purpose 'very well to do it.'" It must be admitted that Mr. FORBES appears to be eminently a man of business habits, who goes straight to the point. Instead of troubling the electors with tiresome political dissertations, he takes his stand simply on his "connexion with a particular institution," and on what he can make the "particular institution" do for Dover if it is made worth his while. The LORD MAYOR of London, who is a candidate for Maidstone, has been giving his friendly support to the Managing Director of the London, Chatham, and Dover Railway; and it is interesting to observe the lofty and patriotic counsels which the chief civic dignitary of the country has been bestowing on the electors. He reminded them that Mr. BARNETT, the Conservative candidate, had once spoken hopefully of a tunnel between the French and English coasts; but what would be the effect of a tunnel on the trade and prosperity of Dover? "It certainly might 'be a convenient thing for the inhabitants of the kingdom 'generally," but it would be a bad thing for Dover, as traffic would be sent through it "like peas through a pea-shooter, without conferring the least benefit on the town." It may be doubted whether the Calais tunnel is not as yet somewhat a remote question; but of course that does not affect the broad principle which the LORD MAYOR lays down, that the great end of Parliamentary government is to promote the obstructive interests of every little Hole-in-the-Corner, at the expense of the general convenience and advantage of the community at large.

It will occur to every one that this is a particularly auspicious moment for the manager of a railway to offer himself for election to the House of Commons. Every day, every hour, we might almost say every half-hour, something is happening to remind us of the delightful perfection to which railway management has now been carried, and to excite feelings of grateful emotion towards the gentlemen to whose care and assiduity we are indebted for these cheerful and encouraging results. It will be admitted that railway management has now reached an amazing point of perfection. As the Assistant-Manager of the London and North-Western Railway observed last week in reference to his Company's killing a lot of people at Wigan, and heroically refusing to do anything to prevent more people being killed in the same way at the same place, there is really nothing that the Companies can do which they have not done to make their arrangements absolutely perfect. Every day brings its own evidence of the beautiful finish of these arrangements, and it will readily be understood that railway

managers, having now brought the working of their lines into such faultless order, must find time hang heavily on their hands. They have done all that can possibly be done to make their lines safe and punctual, and there is really nothing left for them to do. The working of railways has in fact become not only perfect, but automatic; and the great minds which have hitherto directed the railway system are now at leisure to take up the political regeneration of the country. It is evident that men who have transacted their own business so triumphantly are precisely those who are wanted to set everything right in the State. Mr. FORBES, it seems, has only a couple of railways to manage just at present, and he is therefore quite an idle man, and it would be a charity to find him something to do. His friend Sir E. WATKIN manages three or four Companies, and yet has plenty of time for Parliamentary work. Mr. FORBES is Managing Director of the London, Chatham, and Dover Railway, and he is, or was lately, also a Managing Director of the Metropolitan District Railway. Anybody who did not understand railway management in its modern perfection might perhaps imagine that the management of a couple of important railways, or indeed of even one, would be almost enough for the energies of a single man. There are so many things to be seen to—the arrangement of traffic, the punctuality of trains, the security of the public, repairs on the line, wear and tear of rolling stock. Facing-points alone might be expected to cause many a sleepless night. Notions of this kind, however, are only a proof of ignorance. They show that the people who entertain them know very little about the management of railways. A master-mind does not allow itself to be disturbed by such petty details as facing-points that send trains two different ways, broken axles, or irregular speed. Some touch of human nature is to be found even in the greatest men, and it may be difficult not to feel a little momentary annoyance when accidents occur and people are killed; but a great mind knows that it is due to itself to preserve its equanimity under all circumstances. It would appear that Mr. FORBES has accustomed his two railways to manage themselves, and he is now sadly in want of some other occupation. He has formed some grand projects for the benefit of the human race, or at least of that part of it which lives at Dover. He has undertaken, as it were, to drive three horses abreast—the interests of the London, Chatham, and Dover Railway, the interests of Dover, and the interests of JAMES STAATS FORBES. The railway has not hitherto proved a highly lucrative investment to the shareholders, but it may perhaps be some consolation for them to know that it is at least servicable in promoting the interests of the Managing Director and of those whom he is anxious to make his constituents.

We do not know that it is of very much consequence how the election goes, and it may probably be assumed that it will turn on local calculations of what is likely to be got out of the candidates; for if Mr. FORBES is a Managing Director, Mr. BARNETT is a great contractor, and gives, it seems, handsome subscriptions to local funds. There are, however, some considerations connected with the election which are not without interest to the public at large. Travellers to and from Dover are not exclusively inhabitants of that disinterested seaport, and they would probably prefer that Mr. FORBES should be left to give his undivided attention to the safety of passengers. If the history of railway accidents were closely analysed, it would, we suspect, be found that they are due in a large degree to the fact that the actual working of the lines is regarded as a mere detail of quite secondary importance. Railways are not conducted, as other forms of commercial enterprise are conducted, for the sake of the direct profits which they yield, but for the sake of all sorts of indirect and contingent speculations. The minds of directors are filled with grand schemes of financing, amalgamations, extensions, investments in land, building projects, docks or shipping enterprises; and railway managers spend half the year preparing schemes and plans, and the other half in haunting the Committee Rooms of St. Stephen's. The working of the lines, the keeping of the shop as it were, is meanwhile left to common clerks and porters. If managers and managing directors would only stick to their own proper work, there would probably be fewer accidents and better dividends. Again, it may be doubted whether at the present moment it is likely to be altogether for the benefit of the public that the railway interest in the House of Commons should be strengthened. There are several important questions which will have to come before Parliament, as, for example,

whether the continuance of dangerous level crossings, and the conversion of main lines into a series of goods-yards, with expresses constantly dashing through them, should be left absolutely at the discretion of the Companies, and also whether means cannot be devised of providing a simple and more summary process of obtaining damages for injury to life and limb; and every railway director who is returned means another vote in favour of reckless and homicidal management.

There is also another question which is suggested by the proceedings at Dover. What is bribery and corruption? Mr. FORBES has indignantly repelled the accusation that the screw has been applied to the clerks and workmen on the railway to compel them to vote for him, and we have no reason to doubt his word. The screw will not be of much effect against the Ballot; but there are other influences which the managing director of a great Company has at his disposal. It is quite possible that a railway may be worked in such a way as to give a particular town a great local advantage over other towns along the line. Trains may be run to suit its convenience; rates may be adjusted in its interest; and works may be established to swell its population and to bring money into the town. A managing director has a vast amount of patronage at his disposal, and has constantly to give decisions which may affect very considerably the interests of the place. It appears that there is a rivalry between Dover and Folkestone as to which should be the chief port for Continental traffic when the new docks at Boulogne are constructed, and Mr. FORBES promises the people of Dover that, if they elect him, he will do all he can in favour of Dover and against Folkestone. Very possibly Dover is for this purpose better than Folkestone, but the question is one which should be determined by other considerations than electoral favour. Mr. FORBES will no doubt say that he is only exercising the legitimate influence of his position in connexion, as he puts it, with a particular institution, and we do not say that he is not. We merely wish to point out the existence of a new and dangerous form of political corruption.

PROGRESS OF INDIA.

WE have at length seen a model blue-book. The "Statement exhibiting the Moral and Material Progress and Condition of India during the year 1871-72" is the first of a new series of the Reports annually presented by the India Office, and it has been arranged so as to admit of easy reference on the part of persons interested in any one of the fifteen heads under which the affairs of India are grouped. Where necessary, the account of what has been done during the year under review is prefaced by a summary of the earlier history of the subject. Several maps of India are inserted, each coloured to illustrate the particular subject treated of. When we add that the statement seems to be thoroughly well done, and that there is a very full table of contents prefixed to it, and that it is comprised within a blue-book of 160 pages, we shall not be thought to have praised Mr. MARKHAM'S labours too highly. Englishmen cannot now complain of the impossibility of getting any information on Indian subjects. If they study this volume and its successors, they may easily know more about India than they probably know about their own country.

There is something very striking in the picture here presented of the Indian Government. There may be different opinions as to the wisdom which characterizes its labours, but there can be none as to the motive which dictates them. Everywhere the Government is seen playing the part of a visible Providence. To those who are accustomed to the conception of government which prevails in England this continual activity may seem excessive, but India is yet a long way from the point at which a people becomes demoralized by having too much done for it. In the most pressing needs to which they are exposed the natives cannot help themselves. They are powerless in the presence of great natural catastrophes; they can but sit and watch for the rain when it is due, and die of famine if it does not come. Drought and famine are on too large a scale in India to be healed by mere private enterprise. "Agriculture in India," says Mr. MARKHAM, "is susceptible of almost indefinite improvement." The natives work only by rule of thumb, and the improvement of existing products equally with the introduction of new ones depends in the first instance entirely on the Government. In the year with which this Statement has to

do Lord MAYO created a new department of "Revenue, Agriculture, and Commerce," which has charge of all questions relating to land, trade, and statistics. As regards the last subject especially there is an immense amount of work to be done. The survey of only a part of Bengal, carried on under the Court of Directors between the years 1807 and 1813, fills fifty folio volumes of maps and manuscripts, and some record of the kind exists in almost every district. In 1871 Dr. HENTER was appointed Director-General of the new Statistical Survey, and the appendix to his book on Orissa forms the first part of his labours. The need of correct statistics has been strikingly shown by the results of the Census of 1871. In Bengal, says the LIEUTENANT-GOVERNOR, the Census may almost be said to have revolutionized our ideas as to the amount of the population, as to its distribution over districts, races, and religions, and as to the incidence of taxation. The population of the provinces under the Government of Bengal had been set down in round numbers at forty-two millions. It turned out to be sixty-six millions. Of these nearly a third are Mahometans, and in certain districts the Mahometans are largely in excess of the Hindus. These districts do not include the ancient seats of Mahometan power, for at Dacca, Patna, and Murshidabad there are scarcely any Mahometans. The conclusion drawn from this fact is that the Bengal Mahometans are not descendants of the old conquerors, but of converts who were low-caste Hindus, and who embraced Islam to escape from their ignoble position under the Hindu system. It is a startling reflection that Bengal alone contains more Mahometans than any other country in the world. The taking of the Census was regarded with great suspicion by the lower classes among the natives. The general belief was that it was the forerunner of a new tax, but in some places it was supposed that the inhabitants were to be drafted to the hills, where coolies were wanted; and in Murshidabad a still more rigorous Malthusianism was attributed to the Government in the shape of a report that the authorities intended to blow the surplus population away from gunga.

The most important chapter perhaps in the Statement is that which deals with irrigation. A convenient map shows the various degrees in which an artificial supply of water is necessary and important in India. In the North-West there is a region, comprising all Sind and half the Punjab, in which the annual rainfall is less than fifteen inches. Here without irrigation human life cannot be sustained. Surrounding this arid zone there is a Northern dry zone from one to two hundred miles in width, in which the annual rainfall is between fifteen and thirty inches. This district includes Delhi and Agra. A similar zone extends over the interior of the peninsula south of Bombay. In both these cases also irrigation is essential to the existence of the population. The upper part of the valley of the Ganges, Central India, and the Eastern coast of the Madras Presidency constitute a fourth zone, in which the rainfall is between thirty and sixty inches. Even here great distress is often caused by want of irrigation. The deltas of the Mahanadi and the Ganges, together with a strip of land along the northern side of the Ganges valley, have a rainfall of from sixty to seventy-five inches. Here irrigation becomes a luxury, often useful, but never necessary. On the West coast of the peninsula and on the East coast of the Bay of Bengal come two zones of excessive rainfall where irrigation finds no place. Mr. MARKHAM gives a full and interesting account of the steps which the Government of India has been taking for many years past to meet these several needs. In 1864 it was decided that the State should undertake the irrigation works instead of entrusting them to private Companies with guaranteed interest. In 1867 an Inspector-General of Irrigation was appointed, with Irrigation Secretaries in each Presidency. Every year a sum is assigned for irrigation works from the ordinary revenues of the year, which is not to be transferred to any other class of works. When this sum is spent additional works may be executed by loans. The Irrigation Department has also under its charge the vast system of embankments which in the zones of excessive rainfall are required to protect the country from disastrous inundations.

The connexion usually supposed to exist between the need for irrigation and the preservation of forests is doubted by Dr. BRANDIS and other officers of experience. But even if the absolute rainfall is not diminished by the denudation of the country, forests are of great indirect importance to the success of irrigation schemes. Where the mountains are bare, the surface drainage is extremely rapid, the

irrigating rivers are flooded in the wet season, and deprived of part of their supply during the dry season. Where the forests are preserved, the surface drainage is gradual, the springs remain longer full, and the need for husbanding water becomes at the same time both less urgent and more easily supplied. Besides this, timber is in great and increasing demand for fuel, for building, and for use on railways. Rich as India naturally is in forests, the Government has great difficulties to contend with in preserving them. In the unreserved forests, which are under the management of local officers, the people possess or exercise rights of pasturage, of burning, and of desultory and exhausting cultivation, which annually cause great destruction of timber. Jungle fires are constantly lighted either to clear a space for cultivation or for the sake of the fresh grass which springs up afterwards. In the patches thus cleared a crop is raised for a single year without the aid either of the plough or the spade. In the following year the field is abandoned and another patch of forest burnt down. A more costly mode of agriculture cannot be imagined. To gain a single crop millions of seedling trees are destroyed, while for a considerable distance round the bark of the trees is scorched, the wood exposed to the air, and the timber rendered hollow and useless. As yet forest legislation is extremely imperfect. By an Act passed in 1865 the local Governments are empowered to prohibit the destruction of trees, but the Act does not extend to Madras and Bombay, and has not been largely applied even in Bengal. Existing forest rights and the difficulty of exercising effective supervision in the more remote districts present serious obstacles to any real improvement in this direction. Besides the plantations made for the supply of timber, large tracts of ground are now set apart in the hills for the growth of the cinchona plant. On the Nilgiri hills there are now more than two million and a half of plants, and it is found that the bark of the cultivated tree is very much richer in quinine than the bark of the wild tree. Large quantities are now exported, while in India itself the Government is doing its best to bring quinine within the reach of all classes. This is the more important since the progress of irrigation, necessary as it is to the support of the population, in many districts is found to increase the prevalence of fever.

As regards the administration of justice, the most notable feature is the number of civil suits. In Oudh they have doubled in four years; in the North-Western Provinces the number during the year 1871-72 was the highest since the mutiny. This is held to be a sign of great indebtedness and poverty. The suits "are generally for money on written promises to pay, and on very small sums The principal is never paid off, but the interest is mercifully exacted, and the people become slaves to the money-lenders." Sir GEORGE CAMPBELL is disposed to think that the "tendency to uphold doctrines of bare law, and the literal enforcement of contracts alleged to have been entered into by ignorant and improvident people," operate very harshly against the poor. In England the same evil existed before the institution of County Courts, and it eminently deserves consideration whether some similar relief could not be applied in India. Sir GEORGE CAMPBELL is also opposed to the present multiplication of appeals, as giving immense advantage to the rich, and promoting a litigious temper among a race which has no need of external stimulus in that direction. The criminal interest of the year chiefly attaches to the North-West Provinces, where the police are engaged in putting down hereditary thieving and preventing infanticide. There are twenty-nine tribes who support themselves during part of the year by systematic plunder, the gains being divided according to a fixed rule. By an Act passed in 1871 the Government is empowered to remove a criminal tribe into a reformatory settlement, where the members are provided with land at low rates, and encouraged to live an honest life. At the same time they are subjected to rigorous police supervision, and arrested if found beyond the limits of the settlement. Infanticide is being attacked by accurate registration of births and by frequent inspection of female infants. Any village in which the number of girls is less than 40 per cent. that of the whole number of children is proclaimed, and in the proclaimed villages the police supervision is exceptionally rigorous. The cost of the extra police required is paid by a small tax on each house. The number of girls surviving infancy is already decidedly on the increase.

THE SPEAKER AND HIS LABOURERS.

A YEAR has passed since the SPEAKER publicly invited the labourers in his employment to invest their savings in his farm. He offered to pay them a small fixed interest on their investments, and also to give them a share in the profits of the farming capital to which they were to contribute. Mr. BRAND's position and character naturally attracted attention to a scheme which might well be generally adopted if it were found advantageous in a particular instance. Neither the proposer of the plan nor those who discussed its merits considered that the admission of labourers to a qualified partnership in the farm would be useful or generally practicable if it were an act of voluntary benevolence. A change in the economic relations of different classes can only be effected by an appeal to the interests of those concerned. Farmers would probably find it worth while to share their profits to some extent with their labourers if a modified system of co-operation were found to promote industry and fidelity. On the other hand, labourers would perhaps work more steadily if they were certain that regularity and energy would better their condition. After the lapse of twelve months the SPEAKER at his harvest-home dinner has expressed his regret that not one of his labourers had thought fit to accept his proposal. Reluctance to try a novel experiment is not a proof that it would have failed; but the authority of the labourers of Glynde, whatever it may be worth, confirms the opinion of economists, that the well-meant offer of the SPEAKER was founded on an erroneous theory. One objection to the boon which he tendered was that it was insignificant in amount. The profits of the Glynde farm may perhaps in favourable years be 10 per cent. on the capital employed, or 2*l.* on 20*l.* invested by a labourer. The landlord undertook to pay a fixed interest of 2½ per cent., so that, in a year when the profits were absorbed by the losses, the labourer would only receive 10*s.* on his investment. Although the workman might scarcely make the calculation for himself, astute advisers would perhaps suggest that his acceptance of a fractional partnership would give him, to the extent of his contribution, an interest in resisting an advance of wages. A rise of a shilling a week would produce 2*l.* 12*s.* in the year, and it might perhaps annihilate for the time the farmer's profits. Country labourers have recently learnt the ruinous doctrine which has long been held by artisans, that labour and capital are necessarily and perpetually hostile to one another; and it is a legitimate inference from the fundamental proposition that the losses or gains of the investor vary inversely with those of the workman. By the suspicious rural mind the SPEAKER's offer was perhaps construed as an attempt to overreach his labourers, disguised in the form of a bribe.

A more substantial defect in the scheme is the unsoundness of the calculation on which it is founded. A share of profits unaccompanied by liability to loss can only be secured by a guarantee. To a wealthy landowner the sacrifice of a few hundreds in a bad year may matter little; but the ordinary farmer will not undertake a risk without some equivalent advantage. A more feasible plan, which has been adopted in some parts of the country, consists in a scale of extra payments for skilled labour in proportion to its results. It is not unusual to allow a shepherd a certain sum in addition to his wages for every lamb which is reared; nor would it be unreasonable to give labourers on an arable farm a bonus calculated on the excess over a fixed amount of the profits of a grain crop; but, on the whole, it is probably best for all parties that the price of labour should depend on the market rate. When workmen are scarce they have within certain limits the power of dictating their own terms; nor is there any reason why they should not stipulate for the nature as well as for the amount of their remuneration. There are districts in which every labourer requires grass for a cow as a part of his wages; and no custom tends more directly to promote the health of the population. In a rapidly rising market it is not likely that labourers will prefer to an increase of wages a moderately profitable mode of investing their savings. The jealousy and discontent which have been sedulously promoted by aggressive agitators probably disincline labourers to listen with candour to the most liberal offers from landlords whom they are taught to regard as their natural enemies. The organ of the Agricultural Labourers' Union teaches them that the improvement of their condition can only be attained by social revolution. The robbery or expropriation of the landowners excites far more enthusiasm than any measure tending merely to the increase of wages.

The so-called Conservatives who, in pursuance of Mr. DISRAELI's former policy, are now bidding against Mr. GLADSTONE for the opportunity of extending household suffrage to counties, will do well to study the writings and speeches of the rural demagogues. Two phrases which also appear in the publications of the Birmingham League are admirably calculated by their suggestive vagueness to stimulate imaginative capidity. "Free land" and "free labour" might be supposed to imply the removal of restrictions such as those which protective duties impose on commercial exchange; yet the freedom of land is only limited by the freedom of disposal allowed to the owners; and labour is in every intelligible sense absolutely free from the choice or caprice of employers. The only existing impediment to freedom of labour is offered by Trade Unions, which, whether or not they conduce to the interests of workmen, are certainly not devoted to the maintenance of freedom. As used by agitators, the phrase "free labour" seems to mean labour which is highly paid, or perhaps exemption from legal liability to perform industrial contracts. The demand for "free land" is still more ambiguous, although it is used with a sufficiently definite purpose by the avowed advocates of confiscation. The Labourers' Unions have no interest in the abolition of settlements and entails, except so far as absolute ownership might possibly in some cases promote the expenditure of capital on improvements. By "free land" demagogues really mean land free either from private ownership, or at least relieved from the titles of its present possessors. That the redistribution of the land in smaller portions would leave the principle of ownership in land both untouched and practically strengthened is a consideration too remote for revolutionary theorists. Co-operative farming, which may perhaps at some future time be successfully attempted, is not less dependent than petty freehold culture on absolute ownership of land. The political section of agricultural labourers have within a year or two advanced to many of the conclusions which are propounded by Continental reformers at the Hague or at Geneva; but it may be safely assumed that the scheme of vesting the ownership of land in the State would find no favour with rural workmen.

Such schemes as that projected by Mr. BRAND will be more likely to succeed if they are not publicly advertised. A landowner or farmer who knows himself to possess the confidence of an intelligent labourer may persuade him to try an experiment of co-operation or partnership which would inevitably be repeated if it were found to succeed. An allotment of two or three acres of pasture land at a fair farming rent would in many cases provide a better opportunity of investment than a fractional share in the profits of a farm. The distribution of profits among workmen, which has been tried by one or two coalowners and ironmasters, appears not to have succeeded so far as to be widely imitated. It would be highly desirable that some intelligent body of colliers should accept Mr. ELIOT's offer of the lease of a coalpit on equitable terms, to be worked by themselves; yet the distinction between profits and wages is natural and indestructible. Associated capitalists would still be capitalists with an interest in obtaining cheap labour, while the same persons in their capacity of workmen would desire to obtain the highest possible wages. As long as the shares were widely and equally distributed, general opinion might perhaps encourage regular and productive labour; but the proprietors would, if their undertaking were profitable, admit new partners only on onerous terms; and if they employed hired labourers to assist them, they would be found hard and niggardly taskmasters. The anarchical theorists at Geneva and other places, to whose discussions an excessive amount of attention has lately been directed, are already divided in opinion on the question of co-operation. The more sagacious of their leaders understand that, even when they are received by the same persons, profits and wages are necessarily distinct. Agitation might easily disorganize industry, but it will have no effect in modifying the economic conditions of production. If Unions are necessary to secure to labourers the just price of their work, it would be unjust as well as useless to object to their introduction into the rural districts. Combinations for promoting emigration are not less legitimate and justifiable. Unfortunately the demagogues who have assumed the control of the movement have already almost lost sight of the objects which they originally affected to pursue. The virulence of the agitators against the clergy indicates the influence of Dissenting preachers, and partially explains the coldness by which the

clergy offend the sentimental patrons of Agricultural Unions. Instead of protesting against the stinginess of farmers, the professed leaders of the Unions sometimes indulge their sectarian prejudices by denouncing Mr. GLADSTONE because he is supposed to be friendly to the Church, Mr. FORSTER because he has left a Dissenting body, and Mr. LOWE for the forcible reason that he is the son of a clergyman.

HOME RULE AND THE IRISH PRIESTS.

IT is more surprising that the Irish Roman Catholic Bishops should so long have been silent on the question of Home Rule than that they should now have begun to speak on it. The natural tendency of the Catholic clergy in Ireland is always to take the popular side in politics. Their own feelings and sympathies are acted on by the same considerations that move the feelings of the laity, and their dependence on their flocks gives them a direct personal interest in being on good terms with them. An Irish priest who took the side of the English Government in Irish politics must count to reap the consequences in diminished fees and diminished influence. One exception to this general rule has grown up of late years. Since the POPE has been a sufferer by revolution the Roman Catholic Church has steadily set her face against revolutionary movements. She does not mind intriguing against the German Empire or the Italian kingdom, because she regards them as the offspring of the very tendencies she so much dislikes, but insurrections which aim at the establishment of a Republic are hateful for their associations, if not for themselves. So long, therefore, as the Nationalist movement in Ireland was identified with Fenianism, the priests had no choice but to stand aloof from it. Catholic policy in Europe generally overrode in the minds of the authorities Catholic interests in a particular country. As regards the bishops, no doubt obedience to Rome was made easier by the conviction that Fenianism was a hopeless cause. Still it could not have been pleasant for the clergy to find themselves almost for the first time in a position of declared or passive antagonism to their people. Their influence over them had been so mixed up with their leadership in secular matters, that it was difficult to feel sure that it would not be put in peril by their abandonment of that character; and among the lower class of priests there was probably sufficient sympathy with the movement for its own sake to make the episcopal restraint exceedingly irksome. It was to be expected therefore that the clergy would look out eagerly for an opportunity of reinstating themselves in the affections of the people. The Nationalist agitation, now that it has discarded its more ambitious designs, and re-christened itself by the innocent title of the Home Rule movement, provides just the occasion they are in search of. It implies no disloyalty to the English Crown, for, whatever schemes the promoters of the agitation may hold in reserve, they profess at present no wish to repudiate Imperial control, nor even Imperial legislation, except in matters affecting the internal affairs of Ireland. Unlike Fenianism, it is a movement in which everybody can bear his part without danger, so that the exhortations of the clergy to have nothing to say to it would not be seconded by motives of worldly prudence. It is probable, therefore, that these exhortations would have proved useless, even if they had been uttered, and there is nothing which the Irish bishops would more dislike than to see an agitation to which they had shown themselves either hostile or indifferent become universally popular. Nothing is more injurious to natural leadership than the discovery that natural leaders can be dispensed with. Nor is there any need why they should put any restraint on themselves in this matter. In an Irish Legislature the Roman Catholic clergy would exercise very great power, and as it would be difficult to exclude the endowment of religion from the purely local concerns of each kingdom, they would certainly get the educational endowments they want, even if they got nothing more. On the other hand, the University Bill of last Session represented the largest amount of concession to be looked for from an English Minister, and after that was rejected they had nothing left to hope for from Mr. GLADSTONE. Thus all the reasoning which is likely to have weight with them pointed the same way, and the result is seen in the resolutions which have just been adopted by the Bishop and clergy of the diocese of Cloyne.

The effect on the Home Rule movement of this public admission of the Roman Catholic clergy will perhaps not be very

great. In point of fact, its dimensions are already almost as imposing as they can be. It is probable that nearly every seat in Ireland, except those in which Protestantism is an indispensable title to the confidence of the voters, will be carried by the Home Rule party at the general election, and even the support of the priests can hardly make the triumph more complete. The Irish populace have not waited to be told that the claim of legislative independence for Ireland is "the assertion of a true principle and the vindication of an outraged right." They have made up their minds on this point without the aid of the clergy. Still, though the movement may not be really strengthened by the Cloyne resolutions, and the others for which they will supply the pattern, it will receive a sort of official stamp which has hitherto been wanting to it. It is open to any one to deny the seriousness of a popular movement in Ireland with which the priests have nothing to do; but now that they have given it their formal recognition it will be impossible to deny any longer that England is once more confronted by a formidable Irish agitation. There will again be an independent Irish Opposition in the House of Commons giving neither party its certain support, but tempting both by offers of momentary co-operation, and upsetting the calculations of both by unexpected desertions. The solid benefits which have been conferred on Ireland by the legislation of 1869 and 1870 will be forgotten, and the old commonplaces about English misrule will be revived, because England does not choose to risk seeing the policy of the Empire interfered with by so-called local legislation. Still it will be well to be on our guard against exaggeration even in the presence of so annoying a conviction. The Home Rule movement will certainly be less formidable than any of its predecessors. The very circumstance which gives it numerical strength—the moderation of its demands—will in another respect prove an element of weakness. A political agitation which starts by disclaiming any intention of seeking separation from England must to Irishmen seem but a lame successor to Fenianism, or even to Repeal. Recent legislation has taken away many of the practical reasons for desiring to see a local assembly sitting in Dublin; and when that assembly is to be only a sort of subordinate Parliament, having no voice in the general policy of the Empire, the romantic and sentimental reasons for desiring it lose much of their force. Even the maintenance of an independent Opposition is less easy in practice than it is in theory. When an Irish member is on the hustings he may protest with fluent enthusiasm his determination to have no dealings with either Liberals or Conservatives until Ireland has regained her "plundered rights." But it will be difficult for him to be long in the House of Commons without learning to, associate himself with one party or the other; and the temptation to vote for a measure which he wishes to see passed, or against a Ministry which he wishes to see defeated, will be always tending to become irresistible. Nor will he be sustained by the feeling that on his own theory he has no business in the Imperial Parliament, and only keeps his seat there in order to bring about his final exclusion. That was the Nationalist position, but it is not the position of the Home Ruler. If the business of the whole Empire is brought to a stand and the establishment of a strong Government made impossible, it will be for no better reason than because Ireland cannot agree with England and Scotland as to the best mode of managing her local business.

On the other hand, the apparent smallness of the object in dispute will in some respects increase the difficulty of refusing concession. If the Home Rule movement were really what it claims to be—a proposal for relieving a Parliament confessedly overburdened by assigning specific parts of its work to local bodies representing larger or smaller members of the Empire—it would be met in a very different spirit from that which is likely to be called forth by it in its present form. Supposing, for instance, that the suggestion of local Legislatures had come from an English or Scotch member, and had merely been offered as a contribution towards the problem how to make the capacity of the Imperial Parliament keep pace with the increasing demands on it, it might have been debated with as much calmness as a proposal to distribute the House of Commons into Grand Committees. Why then, it will be asked, should so much excitement be imported into the debate because it comes from Ireland? If it is unreasonable in an Irish minority to stop the course of Imperial affairs rather than that their country should remain without a particular application of

the recognized principle of local self-government, is it not equally unreasonable in an English and Scotch majority to acquiesce in this interruption rather than concede a particular application of a recognized principle? The answer to these questions is simple enough. Home Rule in the mouth of an Irishman does not mean the same thing as Local Self-Government in the mouth of an Englishman. Before it can be taken to mean the same thing, the history and antecedents of the agitation must be forgotten. A "vindication of an outraged right," which is the phrase used by the most moderate advocates of Home Rule to describe its scope and purpose, stands for a great deal more than a desire that certain purely Irish affairs should be dealt with without being necessarily brought before the Imperial Parliament. Englishmen believe that, in spite of all assurances to the contrary, the Home Rule party in Ireland wish something for their country which is incompatible with the unity and integrity of the Empire. So long as Englishmen believe this they will resist the demand to the utmost of their strength, no matter how moderate it may be in form. Before the Home Rulers can even be listened to they must show some better evidence than a mere clerical resolution that they honestly, as well as emphatically, disclaim any intention of seeking for separation from England.

DESCRIPTIVE REPORTING.

A QUESTION has arisen as to the propriety of allowing the newspapers to publish what are called descriptive reports of the TICHBORNE trial. The descriptive reporter was already known as a new, curious, and possibly, to persons of a fastidious taste, not very agreeable, product of modern civilization. His appearance in the Law Courts marks the arrival of a new era in the conduct of judicial proceedings, which may possibly in time produce some important and rather startling results. The theory to which the descriptive reporter owes his existence would seem to be that news has no value of its own, or at least very little value except as a means of excitement and amusement. Great ideas are usually found to be germinating in many minds pretty much about the same time, and it appears to have simultaneously occurred to a number of sensational writers that the practical application to the purposes of their craft of the old saying about facts being stranger than fiction had hitherto been somewhat neglected. Fiction involves the labour of invention, while facts are ready to hand, and are often much more wonderful. Consequently a strong mixture might be concocted by dressing up facts as much as possible in the guise of fiction. This is at first sight easier than the invention of incidents for novels, and the literary result is at least equally exciting. The idea has been carried out with much cleverness and industry and with considerable audacity, and descriptive reporting now forms the staple manufacture of contemporary journalism. But the consequences threaten to be somewhat embarrassing. The art received a conspicuous impulse from the Franco-German war. There was then abundant scope for graphic writing, but since the war ceased the professors of the art have unfortunately had nothing to describe except the common events of the day—the laying of a foundation-stone, the opening of a drinking-fountain, or the review of a few companies of Volunteers in a field. They make the most, however, of their scanty materials, and dress them up as much as possible in the old heroic forms. We should think that it was scarcely possible to imagine a more melancholy example of perverted ingenuity than the dismal narratives of the recent military manoeuvres, in which an attempt was made to describe mechanical parades as much as possible in the style of a history of real warfare. The readers of this dreary stuff were supposed to be thrilled by references to "the enemy," and by the mock apprehensions excited by the imaginary reports of sham scouts. The drawback of descriptive reporting is that, although it is perhaps easier to prank up facts with fine writing than to invent well-contrived incidents, yet invention is after all more suitable for the regular supply of an article of daily commerce, and cannot be wholly dispensed with. Facts which are not sufficiently sensational in themselves must be made so by the manner in which they are presented. But then a fact is a fact only when it is let alone, and the dressing-up process is apt to introduce new and unexpected features. The consequence is that there has lately been observable in some of the newspapers a

tendency towards the mixing up of fact and fiction in rather a hopeless manner, so that simple-minded people are beginning to desire that they might be served with the plain truth and its literary adornments in separate columns.

It was of course impossible that so tempting a subject as the daily progress of the TICHBORNE case should be overlooked as a subject for descriptive reporting. The *Times*, which, to its credit, has never stooped to pander in this way to the vulgar tastes of ignorant and idle people, has contented itself with a brief and simple summary of the most striking points in the evidence of each day. Most of the other morning newspapers, however, have treated their readers to gay and graphic sketches of the appearance of the Court, the demeanour of counsel and witnesses, and the impression produced by various pieces of testimony. A sharp eye was also kept on the CLAIMANT to see how he liked it, and when he did not seem to like it, though it might have been the east wind or tooth-ache, or the pure fancy of the reporter, the circumstance was of course sure to be recorded. All this, it must be admitted, made very lively reading. It is not everybody who has the time or patience to wade through five or six columns of questions and answers in small type, but here were all the good bits set out in the most attractive way, with all the little incidents and episodes, and a droll picture of the fencing of counsel and the shuffling of witnesses. Supposing the whole affair to have been got up merely for the entertainment of the public, these reports would have been quite in keeping with the spirit of the proceedings. The only objection to them was that it happened to be a solemn judicial inquiry which was going forward, and that, in their anxiety to amuse the public, the reporters were, in fact, anticipating the duties of the judges and jury, and trying the case on their own responsibility. The jury must reserve their verdict till the last, but each day the reporters passed what was in effect a running verdict on the speeches or evidence as far as they had gone. At last the Judges found it necessary to interpose. The fun, which at first had been mild and guarded, had been gradually getting more fast and furious, and witnesses were described and dissected with a degree of freedom and candour which showed that the reporters had lost pretty well all sense of judicial restraint. The CHIEF JUSTICE intimated in the gentlest manner the disapprobation of the Bench. The Judges, he said, had no desire to limit the liberty of reporting, but they thought there should be no quarrelling with or upholding of particular witnesses; in other words, the reporters had better allow the Judges and jury to form their own estimate of the honesty of witnesses and of the weight to be attached to their statements. Since then the graphic vivacity of the reports has been somewhat moderated; but the question remains whether, in the nature of things, a descriptive report, which goes beyond the letter of the evidence, and introduces all sorts of personal impressions which may or may not have any foundation beyond the casual fancy of individual reporters, each anxious to turn out a lively column for the next day's paper, can avoid trenching on the domain of comment. It is one thing to condense or explain, by reference to the context or to previous evidence, the statements of a witness, but it is a very different thing to attempt to convey the impression produced by the witness's tones and manner of giving evidence.

The way in which the TICHBORNE case has been reported in the newspapers, and the remarks which are from time to time made on it, help to bring out very strongly the change which has taken place in the relation of the public to judicial proceedings. Formerly it was supposed that nobody had any concern in a lawsuit except the Court and the parties on each side. The Court assumed absolute charge of the case, and was jealous even of its being reported until it had passed out of its hands. Occasionally, the publication of reports was forbidden until a decision had been given, or at least until the whole of the evidence had been completed. It is doubtful whether a judge would venture to make such an order at the present day, although there can be no question that he has the power to do so if he pleases. The public has now stepped in to claim an interest in the proceedings as a matter of news, and a section of the press seems to be anxious to encourage the idea that the great object of judicial inquiries is not so much to detect and punish crime or to settle the claims of rival litigants as to furnish the materials of amusing or exciting narratives for the benefit of newspaper readers. A few weeks ago there were demands that Dr. KEELEY should be pulled up in

his speech because people were tired of reading it, and were anxious to see what his witnesses looked like. At other times it has been suggested that various heads of evidence had become wearisome and should be suppressed. In a well-known trial for treason some fifty years ago the publication of the evidence was prohibited until the case was over, lest certain witnesses should see it while the trial was going on, and should get up their own testimony to suit. Witnesses have now every opportunity of knowing what has taken place down to within a short time of their own appearance in the box. Occasionally it may happen that the publication of evidence serves the interests of justice by bringing forward witnesses who would otherwise never have been discovered; but it need hardly be said that it also offers facilities for the concoction of false testimony. On the whole, it must be admitted that the new view of courts of law as a sort of great manufactory of interesting matter for the newspapers is apt to be attended with some inconvenience. It would be difficult and perhaps impossible to interfere with the liberty of reporting trials from day to day; but there can be no doubt that, in the interest of literary decency as well as of justice, descriptive reporting should be strenuously discouraged. The proprietors of the papers who print this sort of stuff will no doubt continue to supply whatever they can find a market for; but they will hesitate to expose themselves to the penalties of contempt of court. It is difficult even to condense evidence without indirectly, in the selection of what seem to be important and significant passages, passing an opinion on it; but description passes imperceptibly into comment of the broadest kind, and the delicate line is almost certain to be transgressed. It is not very long since we read a report of a trial for murder at the Old Bailey, in which the real or supposed starts and twitchings and changes of expression on the part of the prisoner were depicted during the progress of the case as the signs of guilty terror and remorse.

COMMERCIAL MORALITY.

TWO or three little stories which have appeared in the papers during the last few days—and those days have perhaps not been more fertile in scandal than usual—are unpleasantly illustrative of our views of commercial morality. A confiding widow, for example, saw an advertisement offering Wallsend coal for 27s. She bought four tons, which turned out to be totally unfitted for burning. The seller was summoned before Alderman Finnis, and, without disputing the facts, set up a remarkable defence. It was argued on his behalf that he had published “a mere tradesman’s advertisement.” It would appear that a tradesman’s advertisement is a delicate circumlocution for a false statement. The falsehood, however, was asserted to be so transparent that nobody ought to have been deceived by it. If the purchaser really fancied that she was to get Wallsend coals for 27s., she was a fool for her pains, and had no right to expect a remedy. The doctrine does not appear to be peculiar to the coal trade. A dairyman was recently summoned before Mr. Ingham, charged with mixing his milk with water, an offence which, however common, is not very agreeable at the present moment. Here, too, it was argued that people who bought milk for 4d. a quart must know that it was adulterated. Mr. Ingham replied very pertinently that, if people wished to have water mixed with their milk, they would probably prefer to perform the operation for themselves; and the unlucky milkman was fined 10s., with the alternative of two months’ imprisonment. Alderman Finnis also declined to sanction this ingenious mode of argument, though we regret that he only fined the coal-merchant 17s. a ton, instead of inflicting the full penalty of 10l. Not being ourselves either coal-merchants or milk-dealers, we have very little sympathy with the plea they put forward; although they might possibly claim the sanction of a certain celebrated Cabinet Minister, who, as we all know, considers adulteration to be simply a form of legitimate competition. That such practices should be put down with a strong hand seems to the unsophisticated mind as obvious as that picking pockets should be emphatically discouraged. A man who sells a quart of water and calls it milk cheats his customers quite as dishonestly as if he stole their money in a simpler fashion, even if he simultaneously sells four quarts of milk at the acknowledged price. It is exactly the same as if his customers paid him in gilt money and called it gold. In short, the matter does not really admit of an argument, and all consumers, to say nothing of honest traders, must be anxious to see the law rigorously enforced.

The unpleasant part of such transactions is the light which they throw upon the ideas of honesty prevalent amongst retail dealers. When a man has the impudence to say that his customers are to be blamed for their own folly if he succeeds in imposing upon them, we are amazed at the audacity of his assumption. And yet there are too good reasons for thinking that a very similar code of morality is prevalent amongst merchants who trade upon a much larger scale. We need not recall the notorious fact which
